REAUTHORIZATION OF THE CLEAN WATER ACT

WEDNESDAY, JUNE 16, 1993

U.S. SENATE,
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,
SUBCOMMITTEE ON CLEAN WATER, FISHERIES, AND WILDLIFE,
Washington, DC.

THE CLEAN WATER ACT IN GENERAL

The subcommittee met, pursuant to notice, at 9:35 a.m. in room SD-406, Dirksen Senate Office Building, Hon. Bob Graham [chairman of the subcommittee] presiding.

Present: Senators Graham, Lieberman, Lautenberg, Chafee and Metzenbaum.

OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

Senator GRAHAM. I will call the meeting to order.

Today, the subcommittee on Clean Water, Fisheries and Wildlife begins a series of hearings on legislation to reauthorize the Clean Water Act. It is an ambitious schedule of hearings over the next 8 weeks. Our hearings will cover the most significant issues that remain to be addressed in the Act. We will invite witnesses with divergent views and we will use the bill filed yesterday by Senators Baucus and Chafee to guide our discussions.

Today, we will not focus, to any great extent, upon that bill for two reasons. First, it has just been filed and it hardly seems fair to expect our witnesses to have so quickly digested its provisions. More importantly, there are some fundamental issues that I believe need to be explored.

At earlier hearings of this committee regarding the Clean Water Act, I suggested that we are like the person who owns an automobile who is drawn into a detailed examination of the transmission without ever stepping back to ask the fundamental questions, why he owns the automobile and what is his destination? During the next two months, this subcommittee will have ample time to look at the hood, to examine the transmission, and to decide whether to tune the engine or change the oil.

Today, we focus on purpose and destination. The goals of the Clean Water Act in 1972 were ambitious, to assure that our Nation's waters were fishable and swimmable by 1984 and to eliminate the discharge of pollutants into the Nation's waters by 1985. We've come a long way, especially with respect to the treatment of sewage, but we have failed to meet these goals.

Today, a third of our waters still fail to meet their designated water quality. We've imposed significant controls over toxics and other pollutants from industrial dischargers and now find that between one-third and two-thirds of our remaining pollution comes from nonpoint sources. So it is time, 21 years later, to reexamine these goals.

I also believe it is appropriate to examine the appropriate Federal role in meeting these goals. Back in 1972, the national debt was \$436 billion. The Congress was more free to decide how it might wish to spend Federal dollars toward the goal of protecting the chemical, biological and physical integrity of the Nation's waters. Today, the national debt is not \$436 billion but is \$4.4 trillion, over ten times the figure of 1972. We are being asked today to do more with fewer Federal resources.

A fundamental question is what is the Federal Government's role in relationship to the States and local communities? At what point should the Federal Government insist on its values and what is its responsibility to accept the financial ramifications when it does so? I believe we must carefully assess what we can reasonably expect to accomplish and how we can best assist our States, cities and our citizens in assuring that our Nation's waters are safe and that our environment is protected.

I also want to explore the manner in which we hold our Federal agencies accountable for their administration of these programs. We have elected a President who wishes to reinvent government. Part of reinventing government is to establish a clear set of goals for governmental programs—if at all possible, goals which are quantifiable—and then to establish procedures to measure the attainment of those goals in relation to the tax dollars expended to achieve them.

When I first began to study the Clean Water Act and the many issues that face us, I was struck by how difficult it is for EPA or anyone else to tell us exactly how successful the Act has been. We certainly know anecdotally that many of our rivers, lakes and streams are cleaner than they were 20 years ago. Certainly none have caught fire lately, but I am troubled by the absence of baseline measurements and by the fact that we collect a great deal of data that fails to answer the questions a decisionmaker needs to ask.

It is my hope that we can use this opportunity of reauthorizing the Clean Water Act to help the agency set specific program goals and then put in place the means to measure performance and achievement of those goals. In the past, the EPA has measured its success by how many permits or effluent guidelines it has issued. Instead, Congress and the public need to know how much cleaner our lakes, rivers and streams have become. We need also to know that we are addressing those problems that pose the greatest risk to human health and to the health of our ecosystems.

We begin our journey with the Administrator of the Environmental Protection Agency, Carol Browner. Ms. Browner is an American that I have known for many years and I can say without qualification that Nation is fortunate to have her in its service. It seems to me appropriate to discuss these fundamental issues with her and to learn of the issues which her agency believes remain to

be addressed. She will be followed by a panel of distinguished scientists whose testimony I hope will help the subcommittee understand the importance and direction of this Act.

In 1991, EPA asked a panel of scientists, headed by Dr. Bill Cooper, to explore how reauthorization of the Clean Water Act could be used to address existing environmental problems that are critical to the long-term, economic, ecological and human health components of the quality of our lives. They were asked to identify and rank the most important environmental risks affecting our aquatic ecosystems.

While that report did not result in legislation by EPA in 1991, it remains topical today in its identification of those issues that remain for our attention. We hope to generally explore some of those issues today.

It is also my hope that we can learn from them what we know and do not know about the health of our waters. We seek knowledge that will guide us as we explore the difficult issues that will face us over these hearings this summer. Have we done enough to protect the waters from toxic substances? Do we need to focus more upon nonpoint source pollution? Should we shift greater resources and attention to pollution prevention? How can we balance competing interests regarding wetlands? How do we help our cities address their vast infrastructure problems? Should we shift our focus to watershed management?

Our challenge is daunting and the issues are complex. I look forward to working with the members of the subcommittee over the next eight weeks.

**OPENING STATEMENT OF HON. FRANK R. LAUTENBERG, U.S.
SENATOR FROM THE STATE OF NEW JERSEY**

Senator Lautenberg?

Senator LAUTENBERG. Thank you very much, Mr. Chairman, and welcome, Ms. Browner.

Today, we begin the important task of revisiting the Clean Water Act. We've made a lot of progress over the last few decades in cleaning up our waters. Fortunately, they no longer catch on fire, the fish are returning largely to our Nation's waters and raw sewage is no longer indiscriminately pumped into our waterways.

Yet, significant problems remain. We have barely begun to address the problems caused by urban and agricultural runoff which is responsible for a large portion of our remaining pollution. Industry continues to pour poisons into our waters which sewage treatment plants are not designed to control. Overflows of combined sanitary and storm sewers pollute our estuaries with raw sewage, toxic chemicals and garbage which winds up on our coastal beaches. We have over \$100 billion in sewage treatment needs.

Yet, with the defeat of President Clinton's stimulus package, we now face the prospect of reductions in sewage treatment funding for 1994. We still have startling high levels of significant noncompliance with the Act and too often, it's cheaper for the polluters to violate their permits than to pay the penalties which are being charged.

While one of the goals of the Act is to make our waters swimmable, we still have no meaningful program to ensure that those waters are safe for swimming, certainly not on a universal basis. So the results are not surprising.

In 1990, one-third of our rivers, lakes, and estuaries, which have been assessed throughout the country, either are failing to achieve or are threatened with failing to achieve water quality levels which would support uses such as swimming and fishing. States issued 998 fish advisories and established 50 bans on fish consumption. Nearly 26 million fish were killed by pollution in over 1,000 instances. Over 2,000 square miles of shellfish harvesting restrictions were in effect and 300 beach closures were reported by 20 States because of bacteria from sewage treatment plants, combined sewage overflows and urban runoff. This only includes States that monitor beach water quality.

It's clear that despite our past successes, we cannot afford to reduce our commitment to clean up our waters. We're going to need to strengthen the Clean Water Act and I'm pleased that Administrator Browner joins us today to help us in this effort.

When the Congress last passed the amendments to the Clean Water Act in 1987, we faced serious opposition from the Reagan Administration and had to pass the bill over the President's veto. With Administrator Browner's commitment to work with us to address the challenges we have to address in this reauthorization, I'm encouraged that we are going to be able to get the job done.

Mr. Chairman, the people in my State and across the Nation understand that clean water is essential to human life. They want us to make the commitment to rid our waters of bacteria and toxic garbage. Clean water also is essential for our economic well-being. The New Jersey shore is a driving force behind our \$18 billion tourism sector. Certainly, Mr. Chairman, your State and my colleague from Connecticut, both have very significant vested interests in tourism and high water quality.

The tourism business is the second largest revenue producer in my State. In 1991, almost 9 million people, 8.8 million people, stayed overnight at the shore and an additional 59 million made day trips to New Jersey beaches. Further, there were over 350,000 people who serviced these visitors in some capacity, making tourism the number one employer in my State.

Therefore, Mr. Chairman, I look forward to working with you, the committee Chairman, Mr. Baucus, and the committee on this reauthorization. Consistent with New Jersey's key concerns, I urge the committee to work to ensure needed levels of sewage treatment funding as well as the programs needed to correct the problems of combined sewer overflows. In addition, I'm going to seek enactment of provisions to improve enforcement and mandate the testing of waters off our recreational shores.

I want to assure you, Mr. Chairman, of my commitment to work for a bill which will address the remaining water challenges and I commend you for holding this hearing.

Senator GRAHAM. Thank you very much, Senator.
Senator Lieberman?

OPENING STATEMENT OF HON. JOSEPH I. LIEBERMAN, U.S.
SENATOR FROM THE STATE OF CONNECTICUT

Senator LIEBERMAN. Thank you, Mr. Chairman.

We begin today along march not unlike that we began a few years ago in the reauthorization of the Clean Air Act and I am hopeful and confident that under your leadership we will complete this effort as successfully as we completed that one with equally important consequences for our society.

I commend you, Mr. Chairman, for casting this first hearing on the reauthorization of the Clean Water Act, as an opportunity to identify the present quality of the Nation's waters to imagine where we would like to be and then to determine the steps we can take to bridge the distance between our goals and the reality.

I look forward to hearing from Administrator Browner as to what the Clinton Administration most values in the Clean Water Act and I join you in welcoming the distinguished panel of scientists you've invited to educate us further.

Mr. Chairman, you and I, and Senator Lautenberg, come from coastal States where people tend to define their communities by their proximity to the water and often think in very possessive terms of our beaches, our coves, our bays, our inlets, or our inland waterways. The health of each of these waterways determines, in important ways, the health of our communities and, because we are so close the water, we can more readily and immediately see the effects of water pollution.

Birds and other wildlife start to disappear as their habitat is diminished. Shellfish and finfish can no longer be harvested in the same abundance. Boaters begin to complain about unpleasant water conditions and bathers are kept from the beach. So water pollution is not just an aesthetic threat, it is a threat to human health and, as my colleague from New Jersey has said, it cuts directly into the economies of our States. The degradation of a large body of water diminishes the quality of life of those who live near it.

I must say that I was particularly interested in the Form of Scientists Report, which is the focus of this hearing's second panel, that coastal areas are precisely where the rate of erosion of the world's biodiversity is occurring fastest. I was also impressed that the panel would note that the human values derived from an intact biodiversity "range from medicine and biological control agents to tourist economies and spirited belief systems." That such a distinguished panel of scientists would note the linkage of water quality with the quality of both our physical and spiritual well-being gives us another reason, should we need one, Mr. Chairman, for a strong reauthorization of the Clean Water Act.

The report before us expands our notions of what cleaning up the Nation's waters really means. It cautions us to think of rivers, for example, as not simply channels through which water passes, but as part of an ecosystem. The river's health may be as dependent on what remains of the vegetation on its banks as it is on which industrial plants use it for discharge.

The report reminds us that it was not just the chemical but also the physical and biological integrity of the Nation's waters that

Congress sought to restore in the 1972 law. That means rethinking the impact of physical alterations to river and stream flow, for example. Again, it requires considering changes in terrestrial activities—if I can use that term—that impact upon the Nation's waters.

Simply stated, dams kill fish too by altering water temperature, changing the pattern and speed of a river's flow, physically preventing the fish from returning to spawn up river. Similarly, urban sprawl exacerbates stormwater runoff by paving over permeable land and replacing it with new roads, parking lots and the waste from construction sites, all to be washed into the nearest stream or pond.

Wetlands receive particular notice in this context. Their functional values of stormwater retention, pollutant and sewage filtering and flood prevention all must be replaced by artificial means, which again costs the taxpayers dearly.

So the report before us makes clear that while we have come a long way toward realizing some of the objectives of the 1972 law, there are new objectives that have really only just begun to be clear to us, problems that were not addressed in 1972 because we did not know their impact on us in 1972 such as the cumulative effect of the releases of toxic chemicals into our Nation's waterways or what happens when toxics accumulate in sediment or work their way into the water column or up the food chain.

Mr. Chairman, 20 years ago, to bring this home for me, the Connecticut River was known as "the prettiest sewer in America." Last year, salmon spawned in the Connecticut River and that shows the value of the Clean Water Act of 1972. Congress made a commitment to this country when it passed the Clean Water Act. We improved upon and made good on that commitment with the Water Quality Amendments of 1987 and now, we have the opportunity under your leadership to address the problems which remain.

These will be more difficult because nonpoint source pollution, for example, is less discreet, more varied and variable than point source pollution. Restricting certain activities on land are much more troublesome than rewriting effluent guidelines or permits. Acknowledging that toxics build up in our near coastal sediments is more alarming than committing only to further study.

So it will be harder this time around, Mr. Chairman, because we have some real choices to make. I think it will be made easier only if we agree on the premise which I believe we do, that clean water is a critical and widely held value in our country among our constituents.

Mr. Chairman, I want to thank you for calling this hearing. I look forward to the testimony of our witnesses and I look forward to working with you on this reauthorization.

Senator GRAHAM. Thank you very much, Senator.

Our first witness is the Administrator of the Environmental Protection Agency, Ms. Carol Browner. Ms. Browner?

STATEMENT OF HON. CAROL M. BROWNER, ADMINISTRATOR, ENVIRONMENTAL PROTECTION AGENCY, ACCOMPANIED BY MARTHA PROTHRO, ACTING ASSISTANT ADMINISTRATOR FOR WATER, ENVIRONMENTAL PROTECTION AGENCY

Ms. BROWNER. Good morning, Mr. Chairman and members of the subcommittee. I am pleased to be here.

Accompanying me today is Martha Prothro, Acting Assistant Administrator for Water with the Environmental Protection Agency.

I applaud you, Mr. Chairman, and the committee for undertaking this series of hearings. I think it will be extremely informative as we move forward together, I hope, in the reauthorization process. I think the committee has already demonstrated leadership as it has undertaken to draft what I believe will ultimately be a focused, effective and realistic legislation to reauthorize the Clean Water Act.

I think we all understand that the task before us is a very difficult one because, although the Act is fundamentally sound, the challenges that we face today are more subtle and perhaps more elusive to traditional legislative and regulatory solutions than the challenges we faced in the 1970's and 1980's. Today, we need new and innovative approaches to complement the existing array of successful tools and programs we already have to protect human health and the environment.

Although I have not yet had an opportunity to review in great detail the bill introduced yesterday by Senators Baucus and Chafee, I do believe, as I understand it, that it generally focuses upon the themes that need to be addressed. I am pleased that the bill acknowledges the importance of developing effective controls on polluted runoff which is the leading problem facing our Nation's waters today.

I also want to thank the Subcommittee and the full committee for involving the Environmental Protection Agency staff in your deliberations on the technical aspects of the development of this bill. We welcome the spirit of cooperation and believe that our involvement demonstrates not only the administration's support of this endeavor but also that we share the view that reauthorizing legislation must be focused, realistic and implementable.

I would like to begin by briefly commenting on the role of the Federal Government in regulating and funding to protect and enhance our Nation's water quality.

As you all are aware, Congress passed the Federal Clean Water Act in the early 1970's in part to assure that individual States would not be economically disadvantaged by efforts to protect public health and ecological resources. The Act recognized that States and localities should continue to be the primary implementors of water quality programs. At the same time, the Act reinforced a strong national interest in public health and ecosystem protection and, therefore, a need for Federal support of State programs. Out of this vision grew a partnership among local authorities, States and the Federal Government which remains very strong and viable today.

Over its 20 years of implementation, the Clean Water Act is widely regarded as one of our best environmental statutes. Its

broad and flexible authorities have made the Act one of the easiest laws to implement, manage and enforce. I believe it has delivered perhaps some of the most important environmental impacts of all of our statutes and I think the example used by Senator Lieberman is one that we can point to in many instances across this country. Twenty years ago, we did have rivers, lakes and streams on fire in this country. We don't have that situation today. We have made progress, but there is the need for more progress.

I look forward to working with the Subcommittee in making further refinements to the Act. I believe that we are off to a good start.

Today, I would like to focus on five critical issues that it would certainly be our hope will be thoroughly considered during this hearing process and in the final product that leaves the committee and moves forward to the full Senate.

First and foremost is funding. Funding is one of the most critical issues in the Clean Water Act reauthorization. As we address the remaining threats to our waters, we must recognize that new initiatives place a significant increased burden on State and Federal water quality protection programs. Without adequate funding, State and local water and wastewater programs will not be able to fulfill the mandates of the Act or meet the expectations of the public. We need to ensure that adequate resources are available and available for the right purposes.

Long ago, Congress recognized the inextricable link between adequate funding and water quality achievements. In 1981, the Federal Government committed to a 10-year program of \$2.4 billion per year to finance construction of municipal wastewater treatment facilities under the Act's Title II Construction Grants Program. This level of funding was considered adequate to meet the estimated remaining highest priority needs. Other major needs such as correction of combined sewer overflows were not fully considered at that point in time.

In 1987, Congress established the State Revolving Fund Program in an effort to provide long-term financial assistance for municipal wastewater infrastructure needs and phased out the Title II Construction Grant Program. A total of \$18 billion was authorized for both of these programs through fiscal year 1994.

The transition from the Title II Construction Grant Program to the Title VI State Revolving Fund Program, I think, has essentially gone well. All States now have approved programs and are receiving their capitalization grants. Over \$7 billion of Federal capitalization funds and \$6 billion of State matching funds and bond proceeds have been made available for needed wastewater projects. More than 1300 municipalities have received low interest loans through the State Revolving Fund.

Every two years, EPA undertakes a needs survey. Although we have not yet published the data from the 1992 survey of the States, preliminary estimates confirm that the needs continue to grow. Total documented needs have increased in constant dollars from \$90 billion in 1988 to \$108 billion in 1992. As daunting as these figures are, there is reason to believe that some needs may be seriously underestimated in that analysis.

EPA, States and localities are still determining how to meet the Act's requirements for combined sewer overflows, stormwater management, and nonpoint source pollution control. States and local communities will not be able to meet these challenges without continued Federal support.

Investment in our natural resources not only reflects our obligation to act as stewards of our environment, to hold the environment in trust for our children, but also represents sound economic policy. I believe we need to improve our ability to address current water quality problems. We should support community investments in more efficient water use. We expect water safe enough to swim in, to fish from and to drink, and we expect healthy and diverse populations of plants and animals in our lakes, streams, wetlands, estuaries and oceans. Consequently, we must also expect to address the cost incurred by States, municipalities and Federal agencies to treat our wastewater.

The second issue I would like to address is watershed planning. The principal goal of the Act is to protect and restore water body uses by ensuring their biological, chemical and physical integrity. As the water program matures, we are expanding our focus beyond a simple emphasis on chemical pollution to one that provides a greater understanding of ecosystems.

EPA strongly supports what we call the watershed protection approach. By focusing on the watersheds as a whole, we believe that we can address problems more comprehensively, efficiently and effectively and at the same time, take better advantage of the energy and resources of our public and private partners.

The watershed approach is not new to EPA. This approach has been effectively used in several geographically targeted programs, including the National Estuary Program and initiatives focusing on the Great Lakes, the Gulf of Mexico, and the Chesapeake Bay Program to name a few.

We need to provide incentives to the States to voluntarily develop watershed plans for all impaired and threatened waters as well as waters that merit special protection or restoration, such as outstanding national resource waters, wetlands and drinking water supplies. Incentives could include rewarding watersheds for which a State has completed watershed planning with higher priority for SRF funding, harmonizing reporting requirements, and allowing States greater flexibility in developing site-specific pollutant runoff control plans.

We must also apply a similar approach for the Nation's ground water. Eighty-nine percent of our Nation's community water systems rely on ground water. Eighty-six percent of small and very small systems serving fewer than 3300 people rely on ground water as a source of drinking water. Given the hydrological link between ground water and surface waters, the Clean Water Act should expressly recognize protection of public water supplies and ecologically important ground water as a goal of the Act.

We have also overlooked our urban waterways. I firmly believe we have an obligation as a country to return these waterways to their communities for recreation and other uses. The Anacostia River, as I think many of us know, was recently named one of the Nation's most polluted water bodies. It's right down the street. This

river belongs to the people who live in Anacostia, who work in the communities adjacent, who want to recreate in those waters. We need to give it back to the people so that they can enjoy it.

Similarly, we have also overlooked the needs of disadvantaged communities. We must work to ensure greater environmental equity, particularly among the subpopulations of pregnant women, children, Native, ethnic and minority groups.

We should also address the special needs and water quality demands of interstate waters. Water doesn't recognize political boundaries. Many water bodies are shared by one or more States. We need to recognize that; we need to bring together States so that we can do the very best to protect those shared resources.

Wetlands also are critical components of healthy watersheds. We must include wetlands restoration and enhancement as part of our overall watershed protection strategy. EPA is working with other Federal agencies, States, local governments and private landowners to encourage a better understanding of wetlands restoration protection and to deal with some of the problems that have been raised with regard to the 404 Program.

Polluted runoff, which is the contaminated runoff from agricultural lands, grazing and forestry operations, urban areas and commercial activities, is one of the Nation's most vexing water quality problems. Much of the most serious nonpoint source pollution comes from agricultural runoff, including crops, grazing and animal waste. Problems are particularly acute in rural areas of intense agricultural activity where excessive fertilizer use and other activities have been linked to ground water contamination.

We already possess some tools to help. Section 319 of the Act enacted in 1987 required States to assess their nonpoint source pollution problems and to develop programs for managing nonpoint source pollution backed by Federal grants. Over the last four years, we have provided both technical assistance and more than \$190 million in financial assistance to help States with approved nonpoint management programs to provide technical assistance, education and implementation of best management practices. We believe that we are making progress with these and other tools.

At this stage, I believe there are several basic principles that should guide our discussions of the problem of polluted runoff. Specifically, State nonpoint source management programs based on effective local participation should be strengthened. EPA should help to set clearer technical baselines for nonpoint source controls and management practices. We must improve our scientific understanding of the means to control problems such as nutrient and filtration pollution and improve the tools to address them, working closely with other Federal agencies such as NOAA, the U.S. Department of Agriculture, the Department of Interior and the Department of Transportation.

A stronger watershed focus should be brought to bear so that farmers, foresters and other stakeholders can better understand the connection between what they do on their land and the benefits they can help to bring to water quality.

We should encourage innovation, where appropriate, including public-private partnerships and greater use of market-based incentives. Federal funding should support State and local actions but

should not be a prerequisite to accelerating progress. We should implement nonpoint source programs on large tracts under the stewardship of Federal land management agencies. Where feasible, pollution prevention should be the approach of first choice for addressing polluted runoff. Voluntary target approaches should remain the primary focus but backup enforcement requirements at the State and Federal levels are needed when voluntary approaches fail to produce adequate incentives and necessary environmental improvements.

Although I have addressed problems that have been overlooked in the past, I think we also need to be reminded that toxic pollutants remain a critical threat to our Nation's waters despite our substantial progress over the last two decades. In the water program, as in all environmental programs, the traditional end-of-the-pipe approaches have often served us well and have been the driving force behind the significant water quality gains of the past.

However, we have learned that treatment and disposal are simply not enough if we wish to continue to make progress. A more comprehensive prevention-oriented approach, coupled with a strong base program, will allow us to move more effectively toward meeting the overall goals of the Clean Water Act. I believe this is particularly important if we are to achieve additional reductions in the discharge of toxics.

We would like to explore ways to help larger dischargers develop pollution prevention plans tailored to their specific industries. We also believe the statute should be amended to discourage controls that simply transfer pollutants from one media to the next. Pollution prevention approaches can produce permanent solutions to environmental problems, solutions that require less investment in expensive pollution control and greater emphasis on good planning and strategic designs. Prevention, in fact, may be the most cost-effective way to address many of the remaining sources of water pollution while complementing the watershed approach.

Finally, a vigorous enforcement program must remain an integral component of successful Clean Water Act implementation. We believe the Act can be strengthened to improve our enforcement authority and ultimately to enhance State and Federal administration of water quality programs. A strengthened enforcement program will allow us to respond more effectively to the facilities that are not in compliance with the requirements of the Act.

In conclusion, Mr. Chairman and members of the subcommittee, reauthorization of the Clean Water Act provides us with a valuable opportunity to focus on the most important problems facing our Nation's waters. We believe control of polluted runoff is a critical component of an amended Clean Water Act. We also believe that adopting a watershed approach to protect the biological and physical as well as the chemical integrity of our Nation's waters is very important. Similarly, we must recognize that we need to increase our emphasis on pollution prevention as the most practical and cost-effective means of meeting the goals of the Act. Finally, we must help ensure that funding is available to States and municipalities to enable them to execute the responsibilities and obligations that the Act entrusts to them.

I recognize that I have described a large task, but our Nation's waters and our Nation's citizens demand that we address these problems, that we face—and not ignore—the challenge.

I look forward to working with the Subcommittee and the full Committee as we move forward in this process.

Again, I appreciate the opportunity to be here today.

Senator GRAHAM. Thank you very much for that extremely helpful, thoughtful analysis of history and the future.

Senator Lautenberg?

Senator LAUTENBERG. If I might be excused and be permitted to submit questions for the record?

Senator GRAHAM. Senator Lautenberg, if you would like to ask any questions at this time before you have to leave, I would be pleased to defer to those questions.

Senator LAUTENBERG. Mr. Chairman, your kindness is well-known and emphasized today. I'll even decline that generous opportunity, if I might. I have another subcommittee that I've got to attend.

Thank you very much.

Senator GRAHAM. Thank you, Senator.

Ms. Browner, as I indicated in my opening statement, I am interested in talking about some first purpose questions here. High on that list is the fundamental rationale for the current level and the proposed future level of Federal involvement in this issue.

Traditionally, water has been a State responsibility. The States have jealously guarded their rights to determine quantity allocations of water and most other ramifications. In 1972, when the first Clean Water Act was passed, there was sufficient evidence that responsibility was not being discharged adequately, with dramatic examples of highly polluted water and that the national interest was being affected.

There was also, as you suggest, the concern about competitiveness among the States, that the States might be competing to see who had the worse water quality standards in order to gain the economic advantages of that.

We also were at a point in time where the State governments were just beginning to establish competencies in effective environmental control. Our own State of Florida had just five years prior to 1972 established its first pollution control agency and the Federal Government was in a financial situation and status in which it could make fairly generous commitments to this as well as other environmental programs.

Much of that history of 21 years ago has altered. So the question I have is, in the context of 1993, what do you feel is the rationale and what should be the touchstone as we come to the various vexatious issues from wetlands control to toxics that we should repair to in terms of justifying the Federal involvement?

Ms. BROWNER. Mr. Chairman, I would make two points in response to your question.

The first is, again, to recognize the need to maintain the flexibility and the partnership between the Federal Government and the State and local governments that has been created in the Clean Water Act. I think that while there are changes and corrections we would like to see made, most people would agree in general that it

has been a successful partnership and that it has been bringing all parties to the table to develop programs that seek to address the concerns of individual States and local or regional components of that State.

In terms of the Federal Government's financial commitment—obviously we are dealing in difficult financial times with a very large deficit—the President, in his Vision for America budget, has called for a Clean Water State Revolving Fund because he recognizes, I think in part as a former Governor, the need to assist our States and municipalities as they come into compliance with the Federal standards and that we should provide those funds to them. While there are some cities that in fact may be able to deal with these issues outside of the SRF, there are many small and medium-sized communities that will not be able to deal with these problems without some Federal support, and that is an appropriate role for the Federal Government to play.

Senator GRAHAM. You talk about partnership, I described historically what the States' role has been relative to water policy, what do you think are the fundamental characteristics of the Federal role in that State-Federal partnership?

Ms. BROWNER. I think it's to provide a framework within which the States can act. You made some very significant comments in your opening statement, Mr. Chairman, about the data. We recognize at EPA that we have a challenge in terms of better managing the data, being better able to provide a snapshot to individual States and to the country as a whole in terms of water quality. That is something that we think we can do. We are seeking to address those concerns and that would be sort of a piece of the puzzle that we bring to the table.

What States are uniquely qualified to do is to develop the local plans. I think if you look at the National Estuary Program, it's a very good example of where you bring that partnership together—Federal, State and local government—with each one bringing their set of tools to the table to look at a watershed in its entirety, to develop a solution and to seek to implement that solution.

Senator GRAHAM. It's been suggested that if the Federal Government is going to be imposing some of its values on State and local communities that it is a necessary corollary that the Federal Government provide a significant amount of the funding to pay the cost of reaching those values.

Do you agree that there is that linkage and do you believe that the current level of Federal financial support is adequate to fulfill the Federal responsibility?

Ms. BROWNER. I believe that we all share the water resources of this country and that it is important that the Federal Government look across the country at the whole in establishing the framework for protecting those waters and for improving the quality of those waters. I believe that it is appropriate for us to provide funds to States as they seek to come into compliance.

The level of funding that the President has called for in terms of the State Revolving Fund, we believe, is an appropriate level of funding. The needs are tremendous. As I said earlier, we estimate—and we have not published the final report yet, but in terms of the recent survey—that there are \$127 billion in needs just

under Title II, which covers secondary treatment, advanced treatment, combined sewer overflows and all of that, and an additional almost \$10 billion when you add in nonpoint source, ground water and some of the other issues that we believe need to be addressed. So there is a very significant need out there. I think for the Federal Government to provide some assistance in meeting that is absolutely essential and appropriate.

Senator GRAHAM. In your statement, you mention that in 1984, it was assumed that \$2.5 billion a year for 10 years would meet the Federal role at least insofar as the most urgent water pollution problems. Three years later, that program was shifted from a grant program to the current Revolving Loan Fund. Almost 10 years after that 1987 assessment, you indicate the outstanding need is \$108 billion and could be more than that.

Were our estimates in 1984 that far off the mark or have our standards changes, have the conditions deteriorated? Why nine years later instead of having come close to meeting what we thought were the most urgent needs are we over \$100 billion behind?

Ms. BROWNER. Well, our analysis a decade ago focused on the traditional municipal wastewater needs. It was a more narrow picture, if you will, of the problems out there. In the last decade, we have come to understand that in fact we need to focus on a larger set of problems, including such things as combined sewer overflow, abatement, stormwater management and nonpoint source control. Those sorts of issues were not included in the needs assessment of a decade ago. That, I think, represents some of the differences you see in the numbers.

I think we all now recognize that, if we are going to seriously deal with the remaining water quality issues facing this country, it will have to be not just municipal wastewater but it will also be combined sewer overflows and nonpoint source.

Senator GRAHAM. Thank you, Ms. Browner.

My time has expired. Senator Chafee, who is the ranking member of the subcommittee and the full committee and one of the most committed members of the Congress for effective protection of our Nation's waters has joined us, but in his graciousness, has deferred to our colleague, Senator Lieberman, to ask the next round of questions.

Senator Lieberman?

Senator LIEBERMAN. I would defer back to Senator Chafee if I didn't think that he was deferring so he wouldn't have to go back to the Finance Committee.

Senator CHAFEE. Would that I was invited to the Finance Committee meeting.

Senator LIEBERMAN. Oh, I'm sorry.

[Laughter.]

Senator GRAHAM. We purposely scheduled this meeting at this time, Senator, to give you something to do.

[Laughter.]

Senator CHAFEE. Thank you. There were only 11 invitees to the Finance Committee meeting recently, regrettably.

Why don't you go ahead Senator Lieberman?

Senator LIEBERMAN. I'd be glad to.

I wanted to start, Ms. Browner, with some discussion about watershed base planning which you emphasized in your talk. I think we are all concerned with the theory that watersheds are the best way to look at water quality and planning but we have this reality which you referred to which is that political jurisdictions generally don't follow the boundaries of watersheds.

I wonder what thoughts you have about how we can assure that watershed plans will be implemented by political jurisdictions which do not follow those watershed boundaries. Do we need, for instance, to create new overarching jurisdictions for this particular purpose?

Ms. BROWNER. I don't think that you absolutely have to do that. Some States have chosen to do that. The Chairman in my home State of Florida in fact has set up water management districts based on watersheds in an effort to manage activities in that way. I think that you can achieve the goal of watershed protection without those sort of jurisdictions, but some States have found them helpful.

I think as we look at the Act and the reauthorization, it is very important that we look at what are the incentives we can place in the Act to encourage States to act that way and that we remove barriers. I think that, particularly because of the framework of the Act as it has existed since its original passage in 1972, it is important that we continue the structure of incentives and partnerships and not look to some heavy hammers in terms of "you have to do this or you won't get that", but rather if you can develop a watershed protection plan, then perhaps you move up higher on a particular list for funds.

Senator LIEBERMAN. The nonpoint source pollution control programs which currently require the States to produce at least a statewide plan and the National Estuary Program are probably the closest things we've got to real watershed based planning. I wonder if you would more specifically at this point or later recommend changes in those programs that would improve the States' ability to draft and implement watershed plans?

Ms. BROWNER. Changes in the Clean Water Act?

Senator LIEBERMAN. Yes.

Ms. BROWNER. Yes, we would be more than happy to provide some specific recommendations. I think that the bill introduced yesterday by Chairman Baucus and Senator Chafee does include some provisions that we think are important and move us in the right direction. We are completing our analysis of that and we would be more than happy to provide our analysis when it is completed. (See testimony of Steven A. Herman, Assistant Administrator for Enforcement, July 27, 1993, p. 813.)

Senator LIEBERMAN. Let me ask you something based on a specific experience we've had with Long Island Sound. The Long Island Sound Studies Management Conference is now drafting or redrafting its comprehensive conservation and management plan as required by the National Estuary Program. I think a lot of us who looked over the first draft, into which a lot of effort and money was put, were troubled that it may be easier to imagine these watershed-based planning documents than it is to actually produce them effectively and that in that sense, there may well be a shortage, at

least at the local level, of the expertise to turn out programs that work.

I wanted to ask you, based on that experience, if you would consider ways in which EPA nationally might provide technical assistance to local groups such as this one to upgrade the quality of these watershed-based programs that are hopefully going to be implemented?

Ms. BROWNER. I think your point is very valid. While we do make some funds available in terms of technical assistance grants, there is probably a need to do more. Some communities, you are right, have had better access to the technical input in terms of developing their plans than other communities and that is something we should address, I would agree.

Senator LIEBERMAN. Let me ask you a final question about the State revolving funds which are very much in our minds as the questions have indicated.

A while ago, Senators Moynihan, D'Amato, Dodd and I introduced legislation that would strengthen the National Estuary Program to ensure watershed-based planning and would set aside an increasing percentage of monies each year for coastal States in the argument that is where the most significant need is, that's where the population is moving, set aside an increasing percentage for those coastal States which complied with the stricter requirements of the National Estuary program. In a way, this is an attempt not only to create an incentive system, but to try to create an allocations system understanding that we don't have enough money to meet the need to try to target it to the areas of greatest need and also greatest local effort.

I wondered if you had any reaction to that idea or any other thoughts about allocation formulas for the SRF?

Ms. BROWNER. I think that the issues facing our coastal cities are obviously large ones and I think you are quite right in calling to everybody's attention that, when you look at where the population is growing in this country, when you look at the impacts to those water bodies, it is significant.

In terms of how we should structure, perhaps, a recognition of that in the law, I think it is important to recognize that the SRF formula does recognize need and that should be continued. We would agree that the recognition of need should be a part of any formula discussion.

We are in the process of looking at the legislation that you have introduced and will be talking to your staff about it in the not too distant future.

Senator LIEBERMAN. Good. I'll look forward to working with you on that.

Thank you, Mr. Chairman.

Senator GRAHAM. Senator Chafee?

OPENING STATEMENT OF HON. JOHN H. CHAFEE, U.S. SENATOR FROM THE STATE OF RHODE ISLAND

Senator CHAFEE. Thank you, Mr. Chairman. Thank you for your kind comments about my interest in these areas earlier and I appreciate that.

I also want to say that you have been a tremendous mover in connection with Clean Water and other activities and we are delighted that you are heading the subcommittee.

I have a statement that I will submit for the record.

Ms. Browner, when are we going to get an Administrator for Water? As I figure it, it is June 17th, isn't it?

Ms. BROWNER. Yes, you are right.

Senator CHAFEE. June 16th.

Ms. BROWNER. We will do it by June 17th. No, Senator, we are, I think, very close.

Senator CHAFEE. That's a big term. That allows you a lot of leeway.

I hope you get going because I think that it is very important for us to have some guidance in what the administration truly wants. You've got a big office you're trying to handle and obviously you can't handle all of these things, so I hope you get on with the selection of your people. I don't know whether the tie-up is at the White House or where it is, but I hope you can move rather quickly.

You acknowledge in your testimony that one of the major problems is nonpoint source pollution. In the past, when it came to seriously dealing with that, we tiptoed around it because of the danger of land use planning. That was something that got the hackles up of all the locals, the Governors and the mayors, and the Congressmen and Senators would get very excited if we indicated we were going to do anything that involved land use planning.

In this legislation, it does require the farmers, in impaired watersheds, to adopt the best management practices. As I understand, EPA has put out a volume on best management practices. Somebody told me that it is the size of a phonebook. They didn't say which phonebook, but that is a threatening term. Is that so?

Ms. BROWNER. As I understand, perhaps the document you are referring to doesn't just speak to farming activities, but to a variety of activities.

Senator CHAFEE. But best management practices?

Ms. BROWNER. That is correct.

Senator CHAFEE. How are we going to get a farmer to cooperate? If he's a dairy farmer in Maryland not so far from the Susquehanna River and he's got enough problems without worrying about best management practices as EPA defines it. Why should he participate? Why should he keep his cattle from breaking down the banks of the river of the little stream that runs through his property? Why should he worry about the fertilizer runoff on his corn fields?

Ms. BROWNER. Senator, I think there is a tremendous resource in the U.S. Department of Agriculture and the Soil Conservation Service in terms of reaching out and working with these farmers, working with them in a way that they can understand and relate to.

Senator CHAFEE. You've got some of the largest dairy farms in the United States I guess in Florida. What did they think when you came around telling them how to behave?

Ms. BROWNER. Before my tenure in Florida, and the Chairman will remember this because as Governor, he certainly participated in it, the State had undertaken a comprehensive analysis of the

dairy farmers in the Lake Okechobee area because of the effects of the runoff from those dairy farms on the water bodies. It has been a program that has had its ups and downs, I'll be very honest with you.

I have met with the farmers. I did meet with the dairy farmers down there and it was a real hands-on thing. The way it worked was people were out in the field on almost a monthly basis early on and that's what it is going to take. It's going to take using people out in the field who understand farming practices, who understand what are the changes that can work for farmers and, quite frankly, what are the changes that will not work for farmers.

Senator CHAFEE. I'm all for this but the practicalities of it, the farmer isn't affected by the pollution that shows up in Chesapeake Bay, he's upstream. So how do you get him to put a fence along the banks of the stream and just have one place and maybe have a concrete apron of some type, all of which costs money? In Florida, in comparative situations, how did you get the farmer to invest that money when there is no return for him? What does he care if the banks of his stream are broken down?

Ms. BROWNER. In some instances, there is a return. Best management practices can sometimes be very cost effective in terms of how a farmer is using fertilizers or is managing the water. There are, in fact, monies to be saved as you implement these best management practices.

In Florida, we also have funds available to assist the dairy farmers. There was State money available. I think there is also the issue of farmers recognizing the importance of their soil and of protecting the soil, and that frequently these best management practices will also help to protect their soil and the quality of the soil.

Senator, I don't want to suggest in any way that we don't think this is difficult. It is difficult.

Senator CHAFEE. But you had some success?

Ms. BROWNER. We have had success, yes. There are other States that have had successes.

Senator CHAFEE. My time is just about out.

[Senator Chafee's opening statement follows:]

OPENING STATEMENT OF HON. JOHN H. CHAFEE, U.S. SENATOR FROM
THE STATE OF RHODE ISLAND

Mr. Chairman, I want to join with you in welcoming Administrator Browner and the other witnesses to our hearing this morning.

We're off to a good start on reauthorization of the Clean Water Act. As you indicated, I joined with Senator Baucus on a reauthorization bill that was introduced yesterday. We very much appreciate your willingness to use that bill as the text for these hearings and are grateful for the time you have set aside for this task in the coming weeks.

Perhaps the most important principle that guided our drafting efforts was the desire for a bill that is workable. The Clean Water Act has been a big success in my view. We need to keep it on course. When we work on reauthorization bills in this Committee, there is always a temptation to address every environmental problem . . . to pile on one mandate after another.

But we have to be realistic about the resources that are available to EPA, to the states and cities, and to the regulated community. Our responsibility is to identify the most important priorities that can be accomplished with the resources we have and to muster the political will to follow through on the requirements that we enact.

I have heard Administrator Browner say on more than one occasion that the work of EPA is driven too much by litigation . . . citizen suits seeking court orders to carry out non-discretionary duties. She wants to carry out the law. But she has said that in the past EPA has not been frank with Congress on what can be accomplished and what must wait for another day.

Today is her chance to be frank with us. We have already cut back on the mandates in this bill. This bill is less demanding than Clean Water proposals circulated in the last Congress. But there may still be items in the bill that give EPA concern . . . things that can't be done . . . or things that shouldn't be mandated because they are of a low priority. The success of this bill, both in the legislative process and as it is implemented in the future, depends to a considerable degree on the quality of the advice we get from EPA now. Be tough. Be specific. Be frank. That's what we need.

Thank you.

Senator GRAHAM. We've been joined by Senator Metzenbaum who has an opening statement.

Senator?

OPENING STATEMENT OF HON. HOWARD M. METZENBAUM, U.S. SENATOR FROM THE OF OHIO

Senator METZENBAUM. I'm not a member of this subcommittee, but I wanted to attend today's hearing to begin the very important process of reauthorizing the Clean Water Act. Few issues could be more important or more necessary than cleaning up and protecting the Nation's precious waters.

I have to doff my hat to Senators Baucus and Chafee for introducing legislation to reauthorize the Clean Water Act. With the introduction of their bill yesterday, they put us on the right path toward enhancing and protecting water quality in this country.

There is no doubt about it, tremendous progress has been made in cleaning up our rivers, our lakes, our streams and our ocean coasts, but much more remains to be done. Untreated sewage, industrial discharges of toxic pollutants, pollution from urban and agricultural runoff still threaten our waterways. The Clean Water Act legislation addresses these water pollution problems on a national basis.

Very shortly, I plan to introduce legislation which will focus on the special pollution problems of the Great Lakes, which I might point out represents 95 percent of the Nation's freshwater surface water. My legislation will expand upon the proposal which I offered last year to the water resources bill and which I've reintroduced this year dealing with sediment management and control. I can't think of a more critical issue as far as the Great Lakes are concerned.

Right now, thousands of acres of underwater sediment are contaminated by toxic pollutants dumped by factories, sewage treatment plants, hazardous waste sites and other sources. In fact, these sediments are the main reasons for fishing restrictions in the lakes. Improper dredging and disposal of these contaminated sediments in the lakes cause us further harm.

My legislative proposal will require the Corps of Engineers to pay more attention to environmental concerns when deciding where to dispose of dredge spoils in the lakes and give EPA bigger role in this disposal process. The bill will also facilitate the cleanup and removal of contaminated sediments and help develop ways to reduce sedimentation of the lakes.

The bill will move beyond the sediments problem and investigate such issues as pollution prevention and lakewide management plans and Federal research activities on the lakes. These are not simple issues, but they are very important ones.

I look forward to working with the members of the Great Lakes community, members of the subcommittee and the full committee on my legislative issues as well as on the broader clean water reauthorization legislation.

I know the subcommittee will spend the summer holding a series of hearings on clean water-related issues. I look forward to them, but the truth is, I also look forward to the day when we in Congress craft the final measure that will protect and enhance the quality of our Nation's water.

I commend you, Mr. Chairman, for chairing this hearing and I commend Senators Baucus and Chafee for their leadership in this area. I think together we can do a job that is very worthwhile.

Senator GRAHAM. Thank you, Senator.

We'll have one more round of questions for Ms. Browner before we move to the second panel.

Ms. Browner, in your opening statement, you alluded to the importance of data collection. I share that feeling. If we are going to try to take a performance-based approach, which watershed management entails, it is imperative that there be a capability of monitoring that performance.

Could you give us your comments as to where you think we are today in terms of having adequate data collection systems in order to support the decisions that will have to be made under an increasingly performance-based management system?

Ms. BROWNER. Mr. Chairman, we recognize that we need to do a better job. This is quite frankly an issue not just in terms of our water program but an issue across the agency. We collect an awful lot of information, we're required to collect a lot of information within the agency. Frequently, when those original requirements are established, the information is collected for one sort of specific reason; over time, we recognize that there are many other uses that can be made of that information.

We are seeking across the agency to make sure that we have an integration of our data management systems so that we can undertake the analysis that we believe is appropriate for the Federal environmental agency in this country to be doing in order to provide the policymakers, the Congress, with this sort of information.

The process that had begun in the agency had been estimated at full funding to take about 3 years. We are still dealing with some funding issues but we are moving forward within existing resources to do what we can. I think we will also need to look at how we require information, what is the information that we require, and to perhaps broaden some definitions so that we get a wider variety of information so that we can provide that analysis to the public and to the Congress.

Senator GRAHAM. I am pleased that you are focusing on the necessity to have in hand, to the best of our ability, what are the questions you want to have answered before you proceed to collect data. It has been my experience in a whole range of areas from education to the environment that the typical problem is not that

you don't have enough information, it's just irrelevant to the question that you want to ask. So I strongly encourage you to continue your commitment to shaping what are the management issues that decisionmakers at the Federal level, as well as States and communities, will need better data with which to make improved judgments and then develop the data systems that will facilitate supporting those management structures.

You discussed in your statement, Ms. Browner, the strategy of pollution prevention. This has been a major focus in other areas of national environmental concern, particularly in the Clean Air Act. What are some initiatives that you think we could help enhance through the reauthorization of the Clean Water Act that would facilitate the reduction of pollution?

Ms. BROWNER. I think again we need to make sure that we, first of all, put in place every incentive we can to encourage people to move in the direction of pollution prevention and to avoid unintentional disincentives. As we look at the very pressing problem of polluted runoff, pollution prevention will offer us some real opportunities in terms of creative ways of addressing the nonpoint pollution—the agricultural, urban and other runoff—and actually preventing the pollution from occurring in the first place.

I think that the effluent guidelines will also provide us with an opportunity to incorporate pollution prevention goals and pollution prevention techniques, if you will, into the work that we do under the Act.

One of the other things we could do, and there has not been as much of this in the Clean Water Act, is require facilities to actually incorporate pollution prevention into their planning. There is some of that in some of our other statutes, but it's not really in the Clean Water Act. Perhaps we should look at how we could strengthen it to say to facilities, you have to actually think about this, you have to develop plans for pollution prevention.

I want to be clear, it may be in the draft that has been put forward and if it is, we applaud the work on that.

Senator GRAHAM. We're celebrating the first anniversary of the 1992 Rio Conference. One of the areas of emphasis there was prevention pollution. It was stated that the Europeans had developed both a philosophy and some technologies that had reduced the amount of their pollutant discharges, both air and water.

Are there some lessons that we might learn from what other industrialized societies have already implemented that would contribute to our ability to prevent water pollution?

Ms. BROWNER. There do appear to be some lessons that we can learn, particularly from some of the European countries who have moved out in terms of some pollution prevention activities. We do seek to work with other countries in terms of understanding technologies and sharing those sorts of things.

It may be appropriate for us to look at some of these activities and see if they can be incorporated into some of our guidelines to industries and municipalities so that they could also seek to implement them here.

Senator GRAHAM. Thank you, Ms. Browner.

Senator Chafee?

Senator CHAFEE. Thank you, Mr. Chairman.

The Baucus-Chafee bill we've introduced requires EPA to publish a list of pollutants that are highly toxic and that bioaccumulate in the food chain. After you list these pollutants, you mean to ban their discharge from all sources.

Let's take mercury. Thirty percent of the mercury in our waters comes from the burning of coal. How are you going to tackle that one? We say in the bill it is bioaccumulated and highly toxic.

Ms. BROWNER. Senator, in looking at the bill, we feel, as I said in my opening statement, it is a very good bill and a very strong bill. We would like to continue to work on the toxics section with the Committee and the Subcommittee staff. I made reference to it in my opening statement, we certainly recognize the continuing need to address toxics in our waterways in terms of how we can do that as an agency within our resources. That is a question for us and we would like to continue those discussions with the committee.

Senator CHAFEE. When you testified before us at your confirmation, you said you wanted to get away from this business of everybody suing EPA, but one of the problems we find, and your predecessor talked about this, was the shortage of personnel. He told us, and I can only assume that it's accurate, that there's been no growth in the number of people in EPA in the Water Program during the whole Bush Administration.

So if we're going to start out with a whole new series of programs and if we take the pollution or nonpoint source situations we were just discussing, how are we going to support these? Are we going to resort to fees or how are we going to do it? I think one of the things you can do for us is to tell us the requirements you are not going to be able to meet.

It seems to me also there's a series of deadlines that are mandated deadlines in the bill. If you can tell us where you think you can't meet those because of lack of resources or lack of innovation, that would be very helpful. I would assume you could send that list up to us?

Ms. BROWNER. Absolutely, Senator. We are in the process right now of costing out the resources we would have to bring to bear and looking at the very specific issue of the deadlines. We will give you our best analysis as soon as that is available.

Senator CHAFEE. There may be some fees that we can charge.

Ms. BROWNER. I think that the States very much appreciate the idea of sort of a backup, if you will, in terms of some of the permit fees. NPDES may be a good example where the States would probably like to see some Federal pressure put on them to put in place a fee structure so that they have adequate resources to actually manage the program. I think a lot of States actually like the fact that there is a Federal framework for establishing fees; it has given them something to work within in their State legislatures. That is probably something that is appropriate to look at in terms of some of the permitting activities, particularly with respect to the States under the Clean Water Act.

Senator CHAFEE. Thank you, Mr. Chairman.

Senator GRAHAM. Thank you, Senator.

Senator Lieberman?

Senator LIEBERMAN. Just a few questions related to biological and physical integrity of the Nation's waters.

As you know, the panel of scientists we're going to hear from in the next panel issued a report that suggests that we've neglected to address the biological and physical integrity of the Nation's water with the same zeal that we've addressed chemical integrity. Would you agree with that?

Ms. BROWNER. I think that we have a much greater understanding today than we did 20 years ago of the need to protect the biological integrity of our water. Our focus in the passage of the Clean Water Act was on the chemical integrity, on the sewage and things like that. What we understand now is that we've got to address all of these components if we are going to have healthy, viable, usable water resources in this country.

Senator LIEBERMAN. I was happy to learn recently that you've been meeting with the heads of other departments and agencies that are responsible for stewardship of our natural resources. I wondered whether there's been any discussion about how to involve some of those departments like Interior or Energy and NOAA, and perhaps even the Corps of Engineers more directly in ecological restoration activities that would have the effect of restoring some of the biological integrity of our Nation's waters?

Ms. BROWNER. Senator, you're exactly right. At a variety of levels, there are discussions that have been going on with the heads of the departments and agencies, the deputies and on down to the various staff levels. We have had some very good conversations with Interior and NOAA specifically in terms of thinking about how we can address some of the biological concerns.

In fact, one of the things we are working on right now across the three agencies is the whole question of information collection, analysis, and mapping. The biological mapping and ecological mapping program has been ongoing for some time we are trying to determine, what each of us can do and how we can bring that together.

There is an Interagency Working Group that is focusing on these issues across all the agencies that is incredibly enthusiastic and has really been a forum for raising these things and seeing what we can do both in terms of our existing activities and in terms of the reauthorization.

Senator LIEBERMAN. That's good news, good to hear.

Last Sunday's New York Times ran a story about the devastation of the Chesapeake Bay oyster industry. There was a series of facts quoted there. I've heard them before but they startle me every time I hear them about the functional value of the Chesapeake oyster.

Apparently, 100 years ago, the oysters filtered the volume of water equal to that of the entire 18 trillion gallon Bay once a week. Today, it takes the remaining oysters a year to perform that same function.

My question is, as we look for assistance from all quarters in cleaning up our Nation's waters, should we be doing something more to protect the living organisms which naturally improve water quality?

Ms. BROWNER. I absolutely think so. I'm sure the scientists can address this much better than I but there are lots of natural organisms that when in proper balance, do act almost as a kidney for nature. When they are in healthy water bodies, they can perform

and provide this function and when they are in unhealthy water bodies, they can't. You even have areas like the San Francisco Bay, which I guess 100 years ago had a very healthy oyster population but where today I don't think you can even eat the oysters and crabs there. The oyster population out there has been experiencing some problems. It is an indication that the system is starting to fail. We need to take those indications seriously. Those little critters can do an awful lot of good.

Senator LIEBERMAN. Is there something we should be doing for those little critters or as we clean up the water, do we naturally help them and then they help us in return?

Ms. BROWNER. As with all water issues, when it comes to assistance it is a combination of water quantity and quality. We have to, in our nonpoint source discussions, in our watershed protection discussions, recognize that both of those components must come together in a way to provide ecological balance that is so necessary to protect those sorts of animals and those sorts of systems.

Senator LIEBERMAN. Thank you, Mr. Chairman.

Senator GRAHAM. Thank you very much, Senator.

Ms. Browner, thank you for your extremely helpful testimony today. We will look forward to hearing from you on a regular basis as we proceed through this process.

Ms. BROWNER. Thank you, Mr. Chairman.

Senator GRAHAM. Will members of the second panel please come forward?

I'd like to welcome the members of the second panel to our hearing this morning. I will briefly introduce the members of the panel and ask if they will proceed in the order in which they are introduced.

Dr. Bill Cooper is with the Institute for Environmental Toxicology at the Michigan State University. He heads the panel of scientists asked by EPA in 1991 to review the Clean Water Act and make recommendations. I might say, Dr. Cooper, that we have had an opportunity to review your report and find it an excellent contribution to our deliberations.

We also have Dr. Robert J. Huggett, Professor of Marine Sciences at the College of William & Mary. He is a member of the panel of scientists.

The third member of the panel is Mr. Robert Conway, an environmental engineer for Union Carbide Corporation.

The final member of the panel is Dr. James Karr, Director of the Institute for Environmental Studies at the University of Washington.

I would like to make this discussion today as informal as possible. Some logistical problems for the round table discussion I had envisioned make that not feasible, but I would like to maintain a level of informality and particularly encourage the panelists to engage each other. I have found a greater degree of wisdom is shared when you have people who actually know something about the topic engaging each other as well as those of us who are members of this committee asking questions. I would encourage that degree of free-flowing discussion after we have received your initial statements.

Dr. Cooper?

STATEMENT OF WILLIAM COOPER, INSTITUTE FOR
ENVIRONMENTAL TOXICOLOGY, MICHIGAN STATE UNIVERSITY

Mr. COOPER. Thank you, Senator.

In the spirit of keeping it short and in the spirit of looking at a big issue, let me just kind of hit some of the highlights of the observations the scientific group put in the report. Some of them were obviously touched on by you folks today and maybe we can embellish upon them.

In terms of the goals, what are you trying to do, the whole concept of intergenerational equity, making decisions today about economic growth, land use decisions, so that your grandkids also have some choices. The same thing we put in the report for Bill Reilly, that it's not a matter of jobs versus environmental quality. If you don't invest in a higher quality environment, you can't maintain a sustainable economy or a sustainable level of public health. So we don't perceive these things as competitive, they are complimentary.

In terms of the kind of historical aspects of the approach to clean water, I think all of us agree that we've made a tremendous amount of progress in the last 20 years. The original Clean Water Act was mostly command and control, end of the pipe, come up with technology, slap on a number and regulate it. We did end of the pipe control because it was efficient, it was cheap and you could enforce it.

I guess after 20 years, you look at it and ask, was it enough? You look at your environment in terms of its quality, in terms of its biodiversity, in terms of its assets, in some places, it's not, in many places, it's not quite enough, so then you get into areas like non-point source and the other kinds of more difficult implementation phases in terms of regulating discharge.

I think one of the big issues is multimedia. Historically, in the 1970's, most of our environmental legislation was media specific, Clean Air Act, Clean Water Act, TSCA, FIFRA and that kind of stuff. Basically, what we see today is most of the toxicants that bother us in terms of ecologists are moving between media. A good portion of the toxicants in the Great Lakes, where I'm from, are not coming from point sources and they are not coming from groundwater, they are coming from atmospheric discharge. Eighty-five percent of the mercury that's coming into the Great Lakes is coming from the atmosphere. That's true of PCBs, dioxins and DDT.

The Clean Air Act actually, for the first time, does have some multimedia responsibilities. I think it's very important that the Clean Water Act match that in terms of its recognition to what the transport and fate of chemicals are in the environment.

When we talk about persistent toxicants, I think you've got to be real careful. The problem was we talked about compounds, nondegradation, zero discharge, banning products that are persistent. That was all right when you could measure things in milligrams. As my chemist friend will tell you, zero no longer exists and I'm very concerned when you go out and make promises you can't match.

When it comes to mercury, for instance, we just finished our mercury budget in Michigan; 50 percent of it is anthropogenic and

50 percent of it is natural mercury cycling out there where you can't stop. The 50 percent of it that is anthropogenic, half of it is coal and half of it is incinerators.

Senator CHAFEE. What is that word?

Mr. COOPER. Anthropogenic means it is human-based, you guys generate it.

The point is mercury is a very volatile compound, it cycles on its own. So you've got to be careful you don't promise somebody that you're going to ban mercury from aquatic food chains because you can't do it. You could ban the human component maybe but in Michigan right now, if we did those calculations, that would only reduce the mercury by 10 percent and 90 percent of it is coming from out of State.

You've got to get some reality in terms of what you can physically do. You might have it as a goal but I think you've got to recognize the fact that there are limits to what you can crank down. Most of the persistent compounds can be regulated just by banning them, just outright stop producing them. That's all right for PCBs, that's all right for persistent pesticides. When it comes to things like dioxins that are formed by bleaching and by fire, or mercury which is natural, you've got to be real careful that you recognize the fact that you can minimize the amounts fluctuating out there but real careful you don't promise people you can ban them.

When it comes to, for instance, nonpoint source, it's obvious now that we've cleaned up a lot of the big point sources, we look out there and the nonpoint source is the biggest single mass loading that is left. They come in many forms. Most of the approaches in the States have been for voluntary, best management practices—agricultural, forestry, highways, whatever it is going to be.

I don't think the problem is planning for that. Most States have a pretty good idea in their own ecosystems as to how you can approach nonpoint source. I think the problem is implementation. How do you get the clout in a voluntary program? You do it saying if you're in agriculture, you can't get accessibility to subsidies, you're not eligible for Federal subsidies. If it's in forestry, maybe you couldn't be eligible to cut timber on State and Federal forests if you don't cooperate. The mafia a long time ago learned that bribes worked better than penalties. The idea is coming up with some ingenious way to make it in their best interest to cooperate if it's going to be a volunteer program. It's that kind of level of debate we're having right now in terms of nonpoint source.

Senator CHAFEE. That's an unhappy analogy, I think.

[Laughter.]

Mr. COOPER. Well, the Senator asked us to be blunt.

Basically, when it comes to watershed management, one of the recommendations in the report is that you rename the Clean Water Act to the Watershed Management Act because that's what we are doing. You can't manage the chemicals once they are in the water. It's like pollution prevention; watershed management is an analog to pollution prevention. It's far more cost effective to do in the watershed than it is once it hits the sediments of the Great Lakes. That involves again a great degree of different ways of thinking.

You can take a watershed and for instance, put a total mass load as your end point, and a certain total amount of material that can be processed with some kind of sustainability. How do you allocate the access to that processing capability, that free good? You could do it essentially with best management practices and agriculture, you could do it with the European approach that you talked about, the life cycle analysis, go to the best production process and do best production processes and allocate the various access on a watershed basis—quite different from what we are doing today which is mostly concentration-based discharges.

That gives the watershed some choice and flexibility as to what mix of industry are they welcome to accept based on how they can trade off, those kind of internal versus external kinds of controls.

When we talk about environmental data collection, there's no question there's all kinds of data being collected on the environment nowadays. Most of the States rely on the Federal Government to come up with the databases.

One of the things that happens when you cut out the data acquisition systems and we lose our monitoring programs, most of the enforcement is at the State level but most of the monitoring is at the Federal level. Again, you monitor for three different reasons. You can monitor for regulations, which means compliance to your discharge permits and usually that's chemicals. You can monitor in terms of long-term trends. The Administrators of EPA for years have stood up and said to Congress, I think EPA is doing a good job but I can't prove it to anybody. There are no long-term databases to show are you over regulating, under regulating or right on target.

For that kind of trend analysis, you need biological indicators as well. If your purpose is to protect the integrity of the ecosystems, you can't just look at the water chemistry, you've got to look at the biocriteria, the various kinds of populations and community parameters that indicate you are in fact protecting the biological resource. It's a different set of data in many cases.

The other thing you regulate or get numbers for is damage assessment when you want to go to court and sue somebody for damages. In most cases, that is specifically biological kinds of data but usually things that have economic interests. The dollar value of an oyster, you don't worry about a marine algae usually. So there is different kinds of data depending on what datasets you want to collect.

In terms of the habitat and biodiversity, the components in our report that are nonchemical, if you ask ecologists what are the biggest threats to the integrity of our aquatic fauna and flora in this country, it's not chemicals, it's habitat destruction and the introduction of exotic species. That's not human health, that's ecological risks.

Part of the reason they want it emphasized is because some of the original goals were looking at human health and weren't looking at ecology. There was a very different set of factors you look at in terms of integrity of aquatic ecosystems.

I guess the last thing I'd say, then I'll be quiet, is the whole concept of quantity and quality. If you look at habitat destruction, a lot of it is not necessarily the quality of the water, it's the quantity

of the water and the way it's treated in terms of riparian vegetation where the cattle tromp down the banks, where you have peak flows downstream from hydroelectric plants, where you're fluctuating the water levels, a lot of damage is done by quantities and fluctuating levels of quantities as much as necessarily quality.

With that, I'll stop.

Senator CHAFEE. Mr. Chairman, regrettably there is a vote and unfortunately I have to go over for the early part of this vote. I don't know what your plans are.

Mr. Cooper, we had a history professor like you who spoke so fast they said if you dropped a pencil, you missed two centuries.

[Laughter.]

Senator GRAHAM. He must have started very early in history in order to fill up a full semester, if he moved at that speed.

[Laughter.]

Senator GRAHAM. Since this vote has just started, Senator Chafee if you would like to ask any questions of Dr. Cooper, we would take those questions. Then we will take a pause to vote and return and pick up with Dr. Huggett as the next presenter. I apologize for this interruption.

Senator CHAFEE. I definitely will come back. I don't have any questions. I think it was very interesting. What he said is, as we were mentioning before, a lot of this pollution is atmospheric, it's not from point discharges. We've got some big decisions to make if we're going to ban burning of coal, for example.

Senator GRAHAM. We will recess until we return from this vote.

[Recess.]

Senator GRAHAM. The meeting will reconvene.

Dr. Robert Huggett?

STATEMENT OF ROBERT HUGGETT, COLLEGE OF WILLIAM AND MARY, VIRGINIA INSTITUTE OF MARINE SCIENCES

Mr. HUGGETT. Thank you, Senator.

Mr. Chairman, I was a member of the panel in Michigan that wrote the report you have. I have also recently been involved with the Water, Science and Technology Board of the National Research Council.

We have been studying ways to more efficiently manage waste water in our coastal environment. All of that effort has just been published and I believe your staff has a copy. It is entitled, "Managing Waste Water in Coast Urban Areas." I would like to take this opportunity to present a few of the findings of that study because I think they are pertinent to the reauthorization of the Clean Water Act.

Finally, I would like to pick up on some of the things said by my colleague, Bill Cooper, as well as some members of your committee.

More than a third of all Americans live along the coast in urban areas. Every day we have 1400 wastewater treatment plants discharging approximately 10 billion gallons of treated effluent. The annual treatment cost alone is somewhere between \$1.1 and \$1.8 billion. We have another \$11.3 billion gallons of treated industrial wastewater and spent cooling water generated by approximately 1300 additional facilities.

In addition, nonpoint sources, which have been mentioned a number of times here, including urban and agricultural runoff, atmospheric input and groundwater input are growing problems. Pollution can come from outside of the region and come not only, as Bill said, from a watershed but can come from other States and now we find even other countries.

We recently analyzed a coelecanth collected off the coast of Madagascar in approximately 2,000 feet of water that had a very high concentration of polychlorinated biphenyls. Obviously, the pollutants didn't come from there.

There are other human activities that can affect the coastal marine systems. For example, increased irrigation by farmers can reduce the amount of fresh water flowing into our estuaries and overfishing can alter the ecological balance in marine waters.

It was mentioned earlier that the oysters in the Chesapeake Bay have diminished to the point that the volume of the Chesapeake Bay is filtered now on the order of once a year where before at the turn of the century and probably up through the 1950's, on the order of once a week. Not many people realize the devastating effect the loss of the oysters had, not just to the Chesapeake Bay but all up and down the East Coast of the United States. My personal opinion is that it has probably been the most devastating event or happening in the coastal waters of the United States in the history of this country.

A single oyster can filter approximately 100 gallons of water a day, filtering out particles between 2 and 18 microns with up to a 90 percent efficiency. If you can imagine these animals filtering the largest estuary in the United States, the Chesapeake Bay, on the order of once a week. When you disrupt or change the flow of particles in an estuarian system or freshwater system, for that matter, you change or alter the flow of all the chemicals in that system. Many of the toxic or hazardous chemicals are associated with particles. When they are not filtered out of the water column and placed into the bottom of the system by its fecal material, the system changes.

The increased turbidity of the water column, since it's not being filtered, can block sunlight so it doesn't penetrate as deeply into the water column thereby affecting the submerged aquatic vegetation.

I would submit that perhaps one of the best ways we could spend some of our money may not be in upgrading sewage treatment plants, but putting the oyster back in the water to filter as it once did.

Our current wastewater and stormwater management policies are rooted, as mentioned, in the 1972 amendments to the Federal Water Pollution Control Act, reauthorized in 1977 and 1987 as the Clean Water Act. The 1972 legislation asserted authority over the quality of navigable waters such as rivers, lakes and coastal waters, required establishment of uniform minimum standards for municipal and industrial wastewater treatment, set strict deadlines for compliance, and provided Federal funds to help pay for newly acquired projects.

Under the statute, efforts to protect coastal water quality have focused mainly on regulating city sewer systems and other single

point sources of pollution such as industrial plants. This approach has been effective, there is no doubt about that. There is no question the Clean Water Act has produced great benefits for this country.

However, the law's uniform requirements have not allowed a process that adequately addresses regional variations in environmental systems around the country or that responds to changing needs or improved science and technology. To more efficiently protect coastal waters from pollution, the Nation must begin moving on a more flexible, Integrated Management Approach that takes into account the full range of factors that affect coastal pollution and the efforts to control it.

This recently released report calls upon the use of Integrated Coastal Management. It says that "ICM, Integrated Coastal Management, aims to protect coastal ecosystems while recognizing the importance of human activities such as boating or commercial fishing."

Under the approach, the Federal role in integrated coastal management shifts from proscriptive mandates. For instance, now you must have secondary treatment, there is no other alternative basically. It shifts from that proscriptive-mandated approach to a partnership with regional authorities in developing a management system that meets the coastal quality objectives. The authors of ICM suggest several modifications to the Clean Water Act and the Coastal Zone Management Act, including establishment of the National Coastal Quality Program as a supplement to the National Estuary Program.

The study identifies several key issues that planners and legislators must consider when thinking about wastewater management. Many of these issues are not effectively addressed by the current clean water strategies and point to a need for an integration of function among the agencies, including those that are concerned with stormwater and wastewater and runoff, wastewater agencies themselves and agricultural agencies.

For instance, treatment levels, the cost and complexity of treatment are a major factor that vary greatly from area to area. Regional, environmental and health concerns also vary. Wastewater treatment levels and related management concerns need to be guided by water quality concerns rather than by technology-based regulation. By that, we mean that one should look at all of the sources of material within a given water body, be it a watershed or an ecosystem, and decide how best to regulate them. Perhaps secondary treatment is not the best way. There are some areas that have enough receiving water that secondary treatment is probably not required. There are areas where the receiving waters are very limited and more than secondary treatment is necessary. It needs to be done on a case-by-case basis but the ultimate selection should be based on water quality, sediment quality or biological quality.

Relative to excess nutrient enrichment, we find that nitrogen and phosphorus from both point and nonpoint sources can deplete dissolved oxygen resulting in fish kills, ALGAE blooms and other environmental problems. Secondary treatment of water, however, as prescribed by the existing Clean Water Act, does not remove significant amounts of nitrogen.

It has already been mentioned that source control or pollution prevention is a very, very important factor to consider and I won't expand on that here.

I think that it is important to realize that the way we are now managing our coastal environment is by command and control. We can move beyond that. We have the scientific technical capability to now perform risk assessments and relative risk assessments so that we can decide scientifically and technically where the best place to spend our money might be and how to do it.

I recommend highly that as you work on reauthorization of the Clean Water Act that you allow risk-based management to be an integral part.

Thank you.

Senator GRAHAM. Thank you very much, Doctor.

Mr. Richard Conway?

STATEMENT OF RICHARD CONWAY, SENIOR CORPORATE FELLOW, UNION CARBIDE CORPORATION

Mr. CONWAY. Mr. Chairman, I also was involved in the Michigan forum and the National Academy of Sciences study of urban coastal discharges and the EPA Science Advisory Board's study of reducing risks. I testified before this body on the 1972 Act and I'm pleased to be asked to return.

The Clean Water Act has resulted in major reductions in industrial discharges; receiving water quality has improved and that should continue. For example, since 1987, Union Carbide has reduced its water discharge of known and suspected carcinogens by 90 percent. The BAT standards are just being included in the renewed permits, so improvements are going to continue.

I am in accord with the four consensus studies I cite in my testimony by scientific groups that the existing Clean Water Act will adequately control industrial point source discharges. Ratcheting down point source discharges beyond what is already scheduled would impose severe economic penalties with little benefit.

As Congress looks forward to reauthorizing the Clean Water Act, it should take a risk-based approach to determine the appropriate focus. Specifically, it should include four points: flexibility, physical loss of habitat, peer review, and preservation of combined treatment.

First, flexibility through alternative compliance mechanisms should be provided where overall risk at a site can be reduced by an alternative approach. The examples I've cited in the testimony include a stabilization pond at our Seadrift, Texas plant and a pollution prevention project at our Taft, Louisiana plant. These will reduce total environmental releases but don't quite meet the effluent guidelines in terms of suspended solids. So under the present law, we'd be forced to use higher risk alternatives, i.e. higher total releases. Some flexibility is needed to correct this problem.

Second, the areas of greatest risk should be addressed. I agree with the previous speakers that physical alteration of aquatic habitat is the greatest risk to be addressed.

Third, if additional materials are to be regulated, the proposed requirements should be subject to public comment and peer review.

This was not done in the present Act. It is necessary to have this review by qualified scientists.

Fourth, the combined treatment of domestic and industrial wastewater should not be curtailed as suggested by some, but rather controlled by pretreatment standards both nationally and locally. This approach offers treatability, accessibility and economic advantages.

In conclusion, the Clean Water Act does adequately address industrial effluent quality but not the remaining high risks like physical loss of habitat. The reauthorization should include alternative compliance mechanisms considering total releases, peer review of any material that is to be regulated, and continued reliance on pretreatment standards to control combined treatment of industrial and domestic wastewater.

I thank the committee for allowing me to testify.

Senator GRAHAM. Thank you very much, Mr. Conway.

Dr. James Karr?

STATEMENT OF JAMES KARR, INSTITUTE FOR ENVIRONMENTAL STUDIES, UNIVERSITY OF WASHINGTON

Mr. KARR. Thank you, Mr. Chairman, for inviting me to appear before this committee to comment on the chemical, physical, and biological health of the waters in the United States and whether and to what extent the Clean Water Act has achieved its goals.

Abundant evidence indicates that the quality of water resources is being degraded and the supply of fresh water is being depleted. Degradation continues, I would argue, because we have implemented the Clean Water Act as if crystal clear, distilled water running down concrete conduits was the goal of the Act. Although the mandate was to restore and maintain the physical, chemical, and biological integrity of the Nation's waters, its implementation has concentrated on two issues, effectiveness of wastewater treatment technology to control point sources and human cancer risks. The dominance of these two issues has prevented program managers, political leaders and the public at large from tracking the actual condition of water resources.

In drafting a solution, we must keep in mind the admonition from Albert Einstein that goes something like, "You cannot solve a problem by applying the conceptual framework that created it." To change the conceptual framework, we need to shift the societal focus from water quality to a broader concept, the ecological health of the water resource system.

Another shift involves the use of the word "pollution." Pollution is usually assumed to mean chemical contamination, but human influences on water resources are broader than chemical contamination, as already stated by a number of people today.

Humans may degrade or pollute by withdrawing water for irrigation, by overharvesting fish populations, or by introducing exotic species or chemical contaminants. We need a framework that goes beyond faith in chemical criteria and technological solution, a framework that addresses all of these influences.

Using chemical criteria, USEPA acknowledges that water resources throughout the United States are significantly degraded.

More than one-third of river miles assessed do not fully meet their designated uses, more than half the assessed lakes, but EPA underestimates the magnitude of the problem because their analyses are based on chemical rather than biological criteria.

Under Section 305(b) of the Clean Water Act, States are required to report the status of water resources within their boundaries. When those status reports include biological evaluations, they show that conventional chemical criteria fail to recognize 50 percent of the degradation that actually exists. That conclusion is reinforced when one examines the biotas of fresh waters and near coastal environments. Threatened and endangered species, fish consumption advisories in over 40 States each year and declines in commercial fish harvests that run 80 to 100 percent degradation, disappearance of that resource, during this century indicate that the degraded condition of our resources is far more severe than is reflected in the conventional analyses using chemical criteria.

How would we respond as a society if our agricultural productivity declined by more than 80 percent in any agricultural sector? How can we continue to ignore declines of that magnitude in water resources that are essential to the economic and ecological health of human society? Put simply, our dependence on technology-based standards and chemical criteria has failed to protect the quality of our water resources.

Two important advances in the past decade are key to protection of those resources. First is development of a broader conceptual perspective to protect the health of the entire resource system from a diverse array of human influences not just chemical contamination, and the second is the use of biological evaluations to protect the quality of water resources.

The classic arguments against the use of biological monitoring are of little importance relative to the benefits to resource protection that result from their use. Recent studies show that biological monitoring is cost effective, broadly based ecologically, flexible for special needs, sensitive to a broad range of degradation, and easy to relate to the general public.

Three major issues are critical, in my view, to reauthorization of the Clean Water Act. First, the phrase "water quality" should be replaced by a broader concept such as protection of the ecological health of water resource systems. That really, I submit, was the goal of Senator Muskie in 1972. We have not come close to even addressing that issue, let alone accomplishing it.

Second, ambient biological monitoring should be central to assessing the quality of the Nation's water resources. All environmental legislation is grounded in biology, not chemistry, physics or mathematics. It reflects society's biological goals. The objective of ecological health is a biological objective and thus, biological evaluations are critical to all water resource assessments.

Third, we have to evaluate the actual results of management and protection programs. For decades, we have operated water quality programs as if the relationship between societal action and resource condition were known. In fact, our policies are untested hypotheses that continue to result in resource degradation.

In conclusion, reduction in ecological risk should be a central component of the reauthorization of the Clean Water Act because

healthy, ecological systems are the foundation of a healthy economy and society. Society would not tolerate an approach that defined the medical technology to be used rather than an appropriate health end point. The time is right for using the same wisdom to protect the ecological health of water resources by explicitly defining and protecting ecological end points.

Thank you very much.

Senator GRAHAM. Thank you very much, Dr. Karr and the other members of the panel.

I apologize, we have another vote that is underway. Senator Chafee and I will both return as soon as we've completed our democratic duty.

[Recess.]

Senator GRAHAM. Call the meeting to order.

Senator Chafee will be joining us shortly.

I'd like to start with the same question that I asked Ms. Browner and that is I stated in my opening statement what the purpose was of this Act and what the rationale of the Federal participation was in the Nation's water cleanup in 1972. Many things have changes since 1972.

Several of you have talked about a new, less command and control or proscriptive role for the Federal Government and more one of partnership. I'd like to ask if those of you who would care to do so would elaborate on what you think the rationale and the characteristics for a Federal role in water pollution avoidance or cleanup is in 1993?

Mr. COOPER. I think in terms of the States looking at the partnership with the Federal Government, first of all, since many of these things are, in fact, inter-State roles, you need some uniform minimum standards that you must meet. Individual States could have tougher standards like in the Great Lakes, they are much more concerned about surface water than maybe some other States are; there's tourism—fishing is the second largest industry in the State—so uniformity at least in terms of minimum base lines.

I think the States need flexibility to find solutions to meet those standards regionally and where watersheds are State-based. They need the flexibility to use common sense which is very difficult to put into law. Often common sense is only visible when you're actually living with it and doing it.

I think also you need the Federal Government as kind of a big stick backup. Many of these command and control kinds of solutions are going to require some degree of voluntary participation. We aren't going to go out and license farmers; we're not going to go out and license somebody with a chainsaw. You're going to have to get them to comply with good common sense, best management practices and it might well be that the Federal Government needs to be there as kind of a bad cop to encourage, demand, whatever it takes to get a certain amount of compliance.

Senator GRAHAM. Anybody else?

Mr. HUGGETT. I agree with Dr. Cooper. I do think, however, that the criteria and standards should be broadened not necessarily to end-of-the-pipe or effluent standards or criteria, but rather to receiving water or water body standards or criteria. In other words, assume that the health of the ecosystem would be preserved if the

dissolved oxygen were not below some amount then rather than try to prescribe that every pipe has to have no more than such and such, one might be able to reduce dissolved oxygen-consuming material to some acceptable level by controlling non-point source runoff rather than putting the burden on industry.

Allow the flexibility to determine, on a relative risk basis, which source is presenting the most risks and then spend your money and effort to reduce it.

Senator GRAHAM. Yes, Mr. Conway?

Mr. CONWAY. I have two points. When you look at controlling loss of terrestrial habitat and aquatic habitat, I think it's going to take a multidepartmental kind of effort between the EPA, Interior, and NOAA.

My second point is regarding flexibility in the permit system. I think some new means besides a series of numbers none of which can exceed even minimally needs to be introduced to allow these permits be written on a total release basis and not just a bright line kind of single number guideline.

Mr. KARR. I would make a couple of comments.

I think the most important step we can take is to establish a cooperative and collaborative arrangement between Federal Government and all of the appropriate agencies and the States with an understanding of a common goal. I think again, as I said earlier, in Albert Einstein's quote, we have to have a new conceptual framework, we can't use the old conceptual framework to fix what is broken.

By working with the States to define the broader goal with respect to water resources, including in that the recognition that regional variation in ecological systems is real, we then establish rules and principles to meet general goals that are region specific. I think it's very important.

We recognize in our educational system that all children are not equally skilled at learning. We have to recognize that biological systems, ecological systems are not equally capable of taking the many punches that human societies direct at them. We have to be more careful about deciding where and when they can be directed without having the same standards of chemical criteria apply everywhere.

Senator GRAHAM. If I could pick up on the comment that you have made, that is the need to develop a new concept, could you help me think through an intellectual framework for directing the Federal effort and resources? That is, how do we tradeoff, if such a tradeoff is necessary and it will be, the relative amount of Federal, human and financial resources that we should devote toward non-point pollution initiatives as opposed to combined sewer overflow initiatives? Those are just two examples of activities which probably have a cost to remedy that is more than we are going to commit to the entire Clean Water Act funding for the period of this reauthorization.

How do we go about thinking through the problem of where our efforts will have the greatest return in terms of the goal of maintaining the biological integrity of our water systems?

Mr. COOPER. I'd like to comment on that.

Many of us were involved with the risk analysis exercise we did for Bill Reilly on setting the relative risk analysis or the priorities in terms of where do you get the biggest bang for your buck, reducing risk to ecology and human health that came out in 1991.

Since then, EPA has funded a number of States to do the same thing. I just got done leading the one in Michigan. We did this kind of State risk assessment analysis and there are about 25 States now doing it but they are setting their own priorities—where do you get the best tradeoff; is it CSOs; is it nonpoint source, and if so, which watersheds. Some environments, as Jim (Karr) said, can take a lot, and some can't. It's kind of a local sensitivity that one gets.

The big problem is the flexibility because most of the monies in the past have gone from the Federal Government to the State to pay for these programs and has been almost like entitlements. They go with a particular mandate, you must spend it on sewer pipes, you must spend it on air, you must spend it on groundwater. So on the one hand, you have a conduit for funneling monies to help support these programs at the State level that are very inflexible, that are usually tied into a media or a commodity. At the same time, you have the States doing what you're asking for, setting their own site-specific priorities as to where they think the biggest bang for the buck is and somehow you're going to have to get that flexibility that you can reorient or redirect funds to where the local needs are even though they come from a historical source, the Federal Government. That's one I think everyone is going to struggle with somewhat.

Senator GRAHAM. So you would say direct the States to prepare that kind of risk analysis and cost benefit and then have the Federal funds with sufficient flexibility that they can flow into where that State determined they would do the most good?

Mr. COOPER. In fact, they are doing that right now. The big problem is I think the tendency for people to want to over plan things. A lot of States know what they've got to do and they want to get on to implementation. I would urge that money doesn't go into plans just to sit on the shelf but to go into programs that actually get out and start solving problems known by us.

Mr. HUGGETT. I think in addition, in the relative risk arena, we have to be very careful that it's not just a social exercise where everybody decides this is what we think is important, it has to get scientific and technical input. I would dare say there are not too many people in the Chesapeake Bay region, for example, that know about the importance of the oyster. So I think you have to have a very prescribed, good procedure that you have to go through. It can't be just a roundtable discussion where one person says we ought to do this and somebody else thinks we ought to do that.

Mr. KARR. I'd like to make a comment on that as well.

If there is one thing that I think would accomplish the goal that we ought to be attacking, that is to move beyond thinking narrowly about what pollution is. In the work that we've done in the last 20 years, we've identified five major ways that humans alter the quality of water resources and almost all of the energies over the past 20 years have been directed at resolving and dealing with only one of those five ways.

Until we see that water resource in a larger context, evaluate which of the factors, not nonpoint versus point, but which of the factors beyond chemical contamination that are degrading the water resource, we will simply not accomplish our water resource goals.

Senator GRAHAM. Senator Chafee?

Senator CHAFEE. Thank you, Mr. Chairman.

As I understand what Dr. Cooper just said, and the rest of you have reinforced is that the Federal Government provided money in very substantial sums to waste treatment facilities and so therefore, the sewage that comes out of any municipality in the United States now meets primary and secondary standards and has had that treatment.

Furthermore, we have required industries on a technology-based mandate that they reach certain standards of cleanliness for their outflow and that has been expensive for industry.

What you are saying, if I understand this correctly, is that you should have what's known as risk-based decisions and you determine how great a risk is it to have this outflow from City X's sewage treatment plant. Suppose it came out totally raw and that treatment plant was going to get \$16 million to be fixed up, what you would say is, let's look and see in this watershed where that \$16 million could be most effectively spent and you might well find that it isn't for the sewage treatment plant, this raw sewage doesn't amount to a hill of beans out there, it's no problem.

Indeed, in Narragansett Bay, we've discovered that the raw sewage causes our hardshell clams to grow strong and bigger—not so much for eating but it certainly promotes growth.

[Laughter.]

Senator CHAFEE. Do I understand this correctly? Also, I'm not sure that I understand this risk-based business because these are incredibly complicated matters and for you to come along and say, OK, we don't care what happens at Narragansett Bay with the outflow from the problem sewage plant, what we've really got to tackle is all these septic systems.

Mr. HUGGETT. Senator, I think you're exactly right.

Senator CHAFEE. In my description?

Mr. HUGGETT. Yes, sir.

Senator CHAFEE. I'm not choosing sides here. I'm trying to see if I understand what you're saying.

Mr. HUGGETT. Let me give you a firm example of what happened last year. This is not specifically water but it is the same process.

The U.S. Environmental Protection Agency and the Amoco Oil Company had a joint project at the Amoco refinery on York River in Virginia to catalog and characterize all of the emissions from its facility and in doing so, to do a human health risk assessment based on the admissions, i.e., how many people are at risk in the area around the oil refinery from breathing benzoic emissions.

In doing so, they found that the major source or a major source, it could have been the major but I'm not certain, was from an unregulated emission from the filling of barges with refined oil. When they filled the barge, there are vapors of oil in the barge and as the liquid gets higher, it forces the vapors out into the atmosphere—totally unregulated.

At that time, EPA was I believe was requiring all refineries to update their storm drains and so forth because of benzene emissions. Benzene coming out of the storm drains was trivial compared to the barge emissions. They were going to have to spend \$41 million to upgrade the storm drains whereby changing the nozzles on the hoses to take care of the emissions from the barge, was I believe on the order of \$4 to \$7 million. They didn't have the extra \$4 to \$7 million in addition to the \$41 million, so they had to spend the \$41 million on controlling a trivial amount of the emission when they could have controlled much more. That's a relative risk-based approach. That's very simple to do.

Your example of Narragansett Bay and the leaking septic tanks, that is also a relatively simple risk assessment to do. If you are concerned with the harvest and consumption of hard clams in your case, you would look at the area exposed by the leaking septic tanks relative to the area exposed by the sewage treatment plant and you could make the tradeoff.

Senator CHAFEE. This is the problem, we sit up here and dispense the \$2.4 billion for waste treatment plants and you come along and say, don't do it that way, do it on a risk-based method. First of all, that makes life very difficult, it's pretty clear we can come up with some needs assessment. In Florida, for example, they've got a need for \$2 billion for treatment facilities based on the population and so forth. Whereas, if you say, no, you're not going to go that direction, come and tell us what you need under this risk-based assessment to figure out how you are going to take care of the swamplands, wetlands, and rivers and so forth. That makes life very difficult because Florida can come up with untold needs. With outstanding Governors like they have had in past years who are ingenious, I can't help but believe that their list would be quite impressive.

Also, this maybe is a dangerous game to play, isn't it, because you say, well, what do we care, the sewage really isn't doing much harm at Narragansett Bay, but you're dealing with these very, very complex ecosystems and for you to say that it doesn't do any harm, what we really ought to do is deal with the leaking septic tanks, maybe the answer is we ought to deal with both of them.

Mr. HUGGETT. Quite possibly.

Mr. COOPER. Let me address that because we spend a lot of time going around the country trying to convince people and talk to people about what these relative risks mean. A lot of environmental groups didn't want it done at all. They said, all environmental issues are important. If you rank them, the Government just cut the budget on the bottom ones and laugh all the way to the bank. They didn't want any part of it, they wanted to maintain that all environmental issues are of Grade A1 importance, that they all must be fixed as soon as possible.

Our argument was, you don't have enough money in the Federal Government; you can't print money fast enough to do all of them simultaneously to zero risk. You're kidding yourself and if you don't put some kind of a scientific-based priority setting in, the lawyers will do it and they aren't constrained by any science. So it might not be a precise science but at least it gets some kind of a quantitative criteria for saying, if I can only do one or two of them

today, we've got to live with three or four and just cross our fingers, which ones can you afford to put off and which ones you can't. That's what it basically does.

It acknowledges the fact that you can't go out there and have an affluent society and synthetic chemistry that's throw away and risk free at the same time. Technically, you're kidding yourself. A certain amount of risk might just be a function of your affluence, the way we live.

Senator CHAFEE. My time is up.

Senator GRAHAM. I think that the questions that Senator Chafee has been raising are very fundamental. They are a part of the new conceptualization of what it is we are trying to accomplish in an era of limited resources and I would hope that we would have an opportunity either at another forum such as this or through some exchange of correspondence to further extend this discussion of a new risk-based concept.

Senator CHAFEE. Mr. Chairman, could I ask a couple more questions? I don't want to hold you up if you have to leave. I could chair or do whatever you want.

Senator GRAHAM. I am going to have to leave in about five minutes. I'd like to use my five minutes to move to a different subject and that is the issue of pollution prevention, which is a phrase that has a lot of appeal.

Where is the state-of-the-art being practiced in terms of the prevention of water pollution? If you were to go to a city, a country, an industry, to see the best practices in that area, where would you go?

Mr. CONWAY. I'd like to comment about that. We have a plant in Taft, Louisiana where we're faced with reducing our discharges, especially in terms of BOD and solids. We developed a solution at the end of the pipe which cost \$7 million, but the process people have developed a pollution prevention project which cost \$16 million but recovers 40,000 pounds of product a day and cuts down on releases into the air, but doesn't quite allow us to meet this bright line solid discharge.

We're faced with building an additional treatment plant which can meet this bright line effluent guideline and not through the pollution prevention project which nearly meets this guideline, plus reduces discharges into the air and to the land.

The companies are prepared to do pollution prevention projects, but they need some modest flexibility by their permit writers to do that.

Mr. COOPER. I'd like to comment on kind of a conceptual framework of that. The whole life cycle analysis is being practiced right now in Western Europe. It is actually required by the OECD; they have a green logo labeling that if you go and do that analysis from cradle to grave—you start with mining, cutting a tree, pumping oil to get the plastic, the precursor to polyethylene sacs, cutting the tree for paper sacs—you go all the way through until you recycle it, dump it, incinerate it, and dispose it. You do total cost of the cycle, maybe nine different industries involved. It has both private and public components to it. You do total energy costs, water costs, pollution costs, labor costs and what is the bottom line for this product versus that product? It is a total systems cost accounting

where you calibrate different alternative production processes based on the common units, environmental cost per unit per good produced from cradle to grave.

It is something that is coming. There are some industries in this country that are doing it. Canada is talking about having that kind of green label, friendly consumer type. It's all based on these cradle to grave kind of mass balances, what are the total costs in real, consumable and nonconsumable goods.

In the long run, that's the way to go. It's very data intensive. The cycle itself is not just one industry. One person does the mining, some other company does the precursors, someone else does the product, someone else sells it, someone else markets it, someone else picks it up and incinerates it. So the information is scattered but there is a real, good conceptual framework out there to use if you want to start doing it.

Mr. KARR. Some call it industrial ecology. It's the application of ecological principles and efficiency to the industrial process from the beginning to the end of that process.

Senator GRAHAM. I mentioned earlier that at the conference in Rio last June, there was a lot of discussion about this from the Europeans who indicated or at least gave the impression that they thought they were ahead of the United States in the application of these principles. Do you think that is true and if so, what could we learn from the Europeans?

Mr. COOPER. My impression is it's true. That's where a lot of the stuff has been developed. We've talked about it and they've done it. They've actually got the labeling, they've got the legislation through Brussels, the whole works.

In terms of does it work, I guess you've got to wait and see in the sense that the ultimate test of if it will work is whether the consumer will cast their ballot by how they spend their money in the marketplace. If they're willing to spend a little bit more to buy something that's environmentally safe, then the system works. I'm not sure it has been out there long enough to really know whether people talk green or whether they actually behave green. That will be the bottom line.

Senator GRAHAM. On the issue of giving States more flexibility relative to the use of Federal funds so that they can apply it against a broader range of potential activities, Senator Chafee has talked about some of the practical political problems that raises. Another is the fact that we allocate the Federal money now in large part on an assessment of needs, the needs being defined as requirements to bring wastewater treatment plants into compliance.

If you are going to delink funding from wastewater treatment plants and allow States to utilize their available funds against a risk analysis of greatest cost benefit, what would you recommend might be the criteria for the distribution of the Federal funds to the States?

Mr. HUGGETT. First of all, I think you have to have some goal established for the bodies to work. This is perhaps the cooperation that Administrator Browner was talking about and some of us have mentioned. You have to get all the players in the room, in-

cluding the scientists, and decide what do you want of this body of water. Obviously, it can't be a sewer.

Senator GRAHAM. Our problem is a more immediate problem. Currently, we have a law that says whatever Federal funds are available are going to be allocated among the 50 States and participating territories and the District of Columbia on a formula which takes into account quantifiable items like what's it going to cost to bring all the sewage treatment plants in the State of Michigan up to an acceptable standard and as a percentage of the national universe of costs to achieve the same objective, what is Michigan? Is it 5 percent of what it's going to cost the Nation? Then we factor in some population factors.

If you're going to go to a more flexible standard, what would be a fair way to go about the process of allocating the Federal funds?

Mr. COOPER. I think Bob actually came close. If you give categorical grants based on population, miles of river, square miles of surface area, all the mechanical things, the problem is you come up with a fixed kind of formula for allocating your scarce resources without factoring in have you solved the problem.

We've been spending millions of dollars in the Great Lakes since the 1940's. I keep arguing if you keep saying the Great Lakes are dying, that means you wasted the first \$100 million with no benefits. If you don't see any further gain, you ought to get to a point where enough is enough and you can allocate fewer funds to the Great Lakes because you are on top of most of the problems and spend it on the Chesapeake Bay or Narragansett Bay or the Gulf of Mexico.

Obviously from a political point of view, you've probably got a lot of people who don't want to hear that, but if some see a gain, if you're doing a good job, you're mitigating or remediating the sources, the systems ought to clear up to the point where you don't need to continue to dump money at the same rate.

If I were doing it, I'd start with a goal of how clean is clean and as you approach it, you get the squeal out of the pig and you can put your money and energy somewhere else. My governor is not going to like me to say that.

Senator GRAHAM. Dr. Karr and then Mr. Conway.

Mr. KARR. The issue to me is not how clean is clean, but how does society derive values from those water resources in a much larger context. As long as we're asking the question, how do we decide whether we should put it into more and more secondary treatment, we have missed the question, in my view. The question is, what is the end point that we want in terms of the quality of water resources? Then we ask the question is putting more money into wastewater treatment plants the solution to that? I submit, oftentimes, it will not be. What we have to do is get a better process to ask that first question, not be driven by chemical criteria and technological applications.

Senator GRAHAM. Yes, Mr. Conway?

Mr. CONWAY. Being an engineer, my comments are more quantitative perhaps.

What I would do to set priorities is look at risk reduction, the amount of risk reduction which the State can associate with these requests and have the environmental economists dollarize these

risk reductions in some standard way which is agreed to by a group of them.

Senator GRAHAM. Gentlemen, I appreciate very much your participation today. I regret that I'm going to have to leave. Senator Chafee can stay and has further questions. If you would indulge us further, we may have some written questions based on the testimony that you have given that we would like to submit for your further response.

Again, thank you very much.

I might say, Dr. Cooper, my father was an alumnus of Michigan State University and I am pleased to see the leadership which that great institution is continuing to provide.

Senator CHAFEE. [Presiding] Thank you, Mr. Chairman.

Let me give you a hypothetical. You have a pristine stream, you have a chemical company that's going to set up on the stream that is going to discharge x amount into it that will cause 10 percent degradation of the stream—acceptable, no problem.

Under the currently existing system that we have, which was technology-based, we say you've got to eliminate or reduce the waste that is coming out from Company A on this stream. That's what we say now.

Under your system, as I understand it, you'd take a look at the stream and say risk-based, no problem. For the illustration I'm using here, let's assume that 10 percent causes no problem, no recognizable problem. Along comes chemical Company B, again emitting just 10 percent of damage to the stream. You can obviously see where my question is leading.

Let's say when you get to 50 percent, you get to damage where in your risk assessment you can spot the damage, so plants A, B and C and D with 40 percent are home free. Along comes plant E, who is going to go over the hump, get it up to 50 percent. Now you would say, you take a risk-based assessment and you say to plant E, you've got to monitor your discharges, you've got to put in best available technology because under our risk-based assessment you are causing damage to the stream. You've gone over the hump. So it goes for each of the successors.

Indeed, you might say this might be a synergistic effect here where E just produces that final amount that causes terrific damage, so that you say to E, you've really got to strap way, way down because you're the people that have just pushed this thing over the hump.

What do you say now?

Mr. COOPER. Dow Chemical, Midland, Michigan, the City of Midland, Michigan had a nuclear plant they wanted to go on-line and their emission zones all overlapped. The way we do it in Michigan is if you're far enough downstream where the chemicals are degraded back to background so there is no overlap in the mixing zones, they are independent assessments. If, in fact, those mixing zones are going to overlap and in fact, they are adding to the amount of chemical in the water itself, if you add that fifth individual, the other four have to back off first to make room for it or you don't license to go on-line. That's an alternative strategy.

Senator CHAFEE. This is the thing that absolutely drives those companies crazy. You've got a moving target, they say to us. We

came here, we built our plant on this lovely stream, you said it was OK. We could have invested money at a far lower rate at lower cost at the time to take care of this and you said no problem. Now, five years later, you're coming along and harassing us. I'm talking Company A now.

Mr. COOPER. In the real case, since Midland, Michigan and Dow Chemical wanted that nuclear plant because they were sharing the steam, there was cogeneration, it was in their best interest to cooperate. If they don't, then that plant doesn't go on-line, period. It goes to some other stream. You can't just assume that economic development can locate anywhere it wants irrespective of the density that's already there.

Senator CHAFEE. It seems to me that what you've set up under your suggestion—I'm not dropping this on you—but you're saying to a plant that might locate in Pawtucket, Rhode Island on the Blackstone River, you've got to meet all kinds of technology-based standards; you've got to have the very best equipment, but if you go down to Alabama where there is a perfectly lovely, clean stream, go to it, pollute all you want until you get up to that threshold where the stream is being ruined.

Mr. COOPER. But see, it depends on the State. In my particular State, we have four numbers. We have best available technology, which is technology-driven; we have a human health standard in terms of drinking water; we have a human quality contact standard if you swim in it; and we have an ecological standard we get from fish and zooplankton. Whichever the lower number is drives the permit, the lower of the four numbers is the one that drives the permit.

If the technology is there, it's economically viable, it's used by your competitors, it's not way out in left field, you're going to put that on just because it's available and it's cost effective.

Senator CHAFEE. I think that there is a lot in what you say, and this has been stimulating. Maybe the solution is that you would continue with our waste treatment grants, shave them down some and give the States some money for totally discretionary expenditures. The case you used, Dr. Huggett, of the barge where instead of spending \$41 million, if somebody spent \$7 million, you'd do a lot more for the cleanliness of the lakes and the waters.

I just want to ask you one question, Dr. Karr. I don't know what biological monitoring means. I perhaps would use it sometime because it's a wonderful sounding word and I ought to incorporate it in some of the speeches I give, but what exactly do you mean by biological monitoring?

Mr. KARR. Ambient biological monitoring involves examining the biota (fish, invertebrates, plants, and so on) of a water body. The species composition, relative abundance, and health of individual organisms measure local biological conditions and, thus human-induced degradation of streams, lakes, and estuaries.

Biological monitoring is an essential supplement to chemical monitoring because it provides a more direct and accurate evaluation of resource condition. Biological monitoring is going into the field and asking about the quality of the environment that the organisms live in, the quality of the water resource system. Does it support a high quality, biological community, say salmon in the

rivers of the Northwest or does it support nothing but sludge worms and carp? Society would like to have biological communities, I submit, that are of high quality that produce harvestable sport and commercial fish for clams, oysters and so forth.

We must monitor the biology of the river, like we sample blood from humans. It tells the health of the human or it tells the health of the watershed. The only direct way to determine the health of the watershed in an integrated fashion is to ask the biology that lives out there whether it is the way it ought to be or not. That's what I mean by biological monitoring. It reflects a broad range of biological conditions and attributes. It's a direct assessment of the end point, the societal goal, that we have in terms of quality of water resources.

You can do this with fish, you can do it with invertebrates, you can do it with algae. It's better to do it with all of them. Let me give you an example. I was just involved in a case in an eastern State where there were small package wastewater treatment plants around a suburban environment. These were put in rather than major sewage treatment systems because they are cheaper for small, local housing areas.

They discovered that the outflow of some of these package treatment plants violated chemical criteria. The city then proposed to spend \$13 million to put in a sewer collector system and a major wastewater treatment plant. In doing that, they would have destroyed all of the water resources in that area. They would have completely destroyed the channels and the biology of the river.

By the use of biological monitoring, the State showed that this activity would degrade the resource rather than improve it and they stopped that project.

Senator CHAFEE. I think that's interesting.

Mr. Huggett, in the last part of your statement, you made the following quote, which I hope you're right. You say, "Our ability to manage wastewater in coastal areas has improved greatly over the past decade because of advances in science and engineering."

I've been on this committee for 17 years and I'm not so sure that I've seen the management of waste water greatly improved because of advances in engineering.

Mr. HUGGETT. I would agree with you. I haven't seen it either. I said the capability is there.

Senator CHAFEE. You're saying that we can do it but we don't?

Mr. HUGGETT. Yes, sir.

Senator CHAFEE. Which is kind of an indictment of our system. I appreciate all of you coming. You've been very helpful and stimulative. You're nice to help us out.

The hearing is adjourned.

[Whereupon, at 1:00 p.m., the subcommittee was recessed, to reconvene at the call of the Chair.]

[Statements submitted for the record and the bill, S. 1114, follow:]

TESTIMONY OF CAROL M. BROWNER, ADMINISTRATOR, ENVIRONMENTAL PROTECTION AGENCY

Good morning, Mr. Chairman and Members of the Subcommittee. I am Carol Browner, Administrator of the Environmental Protection Agency (EPA). Accompa-

nying me this morning is Martha Prothro, Acting Assistant Administrator for Water. Thank you for inviting me to testify before you today. I look forward to outlining for you my vision for Clean Water Act reauthorization.

First, however, I would like to applaud the leadership demonstrated already by this Subcommittee and the full Committee as it undertakes to draft Clean Water Act (Act or CWA) reauthorization legislation that I hope will be focused, effective and realistic. The task before us is a very difficult one, because although the Act is fundamentally sound, today's new challenges are more subtle and perhaps less readily amenable to traditional legislative and regulatory solutions than those of the 1970s and 1980s. The CWA gives us broad and flexible authorities and is considered by many experts to be one of the best federal environmental statutes. Nevertheless, we need new and innovative approaches to complement the existing array of successful tools and programs we already have to protect human health and the environment, and we need ways to promote the concept of pollution prevention through the Act.

Although I have not had the opportunity to review in detail the bill introduced by Senators Baucus and Chafee, I believe it generally focuses upon the themes that must be addressed. For example, I am very pleased to be advised by my staff that the bill does acknowledge in part the importance of developing effective controls on polluted runoff, which is the leading problem facing our Nation's waters today. In my view, if we accomplish nothing more than this through reauthorization, we can credit the legislation a success.

I also want to thank the Subcommittee and the full Committee for involving EPA staff in your deliberations on the technical aspects of the development of this bill. That spirit of cooperation shows that you not only value the expertise of EPA staff and the support of the Administration in this legislative endeavor, but also that we share the view that reauthorizing legislation must be focused, realistic and implementable.

The new Clean Water Act must focus effectively on the most important water pollution problems to the extent they cannot be adequately addressed under current law. Its mandates must also be realistic in light of the resources we can reasonably expect to be available to federal, State and local governments and the private sector. I am concerned that an attempt to enact comprehensive changes to the Act may distract us from these paramount objectives and may divert scarce resources away from our true priorities. I hope we share the goal of developing and ultimately enacting legislation that strikes an appropriate balance between continuing to emphasize traditional water pollution controls and addressing the broader ecological risks threatening the integrity of our waters. We pledge to you that a realistic law will be fully and enthusiastically implemented by EPA. We continue to be willing to help you embody these principles into law. I look forward to studying the Baucus/Chafee bill in detail with these principles in mind. In the coming weeks, we will work with you to help determine whether the provisions proposed will accomplish their goals effectively and to help estimate the costs to government and society to implement their specific mandates.

I would like to begin by commenting on the role of the federal government in regulating and funding to protect and enhance water quality. The federal Clean Water Act, roughly in its current form, was deemed necessary in the early 1970s in part to assure that individual States would not be economically disadvantaged by their efforts to protect public health and ecological resources. It provided a level "playing field" by setting minimum technology-based requirements for publicly owned wastewater treatment plants and industrial dischargers across the nation. It provided for scientific research and technical guidance on water quality to be developed at a national level because individual States could not acquire or maintain the expertise and abilities to do all this on their own. It recognized that States and localities should continue to be the primary implementers of water quality programs but that there is also a strong national interest in public health and ecosystem protection and, therefore, a need for federal support of these State programs. Because the benefits of pollution control often accrue mainly to those downstream, it also provided for federal financial assistance to local communities facing significant costs for municipal sewage treatment.

Out of this vision grew a partnership among local wastewater treatment authorities, State water pollution control agencies, and the federal EPA. That partnership remains strong and viable today. Over the coming weeks, you will undoubtedly hear a lot about the areas of tension and friction among the partners. A full airing of any problems among partners is appropriate in the development of new legislation. After all, you may be able to address some of the sources of these problems during reauthorization of the Act. But the partnership is still strong, still essential. The

partners have achieved a great deal together. By some estimates, we have reduced water quality impairments by over 50%, even though economic growth has continued in the same period. The partners continue to work towards a common vision of clean water for all our people's health, recreations and economic well-being. We need to foster the partnership because without it we will surely fail.

One issue for all of us, of course, is how to measure our progress. The water quality program has been struggling with this issue from its earliest days. Our people want clean water and healthy ecosystems, but what does this mean? How clean is clean? We have counted the numbers of permits issued, the pounds of pollutants removed from effluents through treatment, the numbers of enforcement actions, the number of fish kills, shellfish bed closures, recorded exceedances of water quality standards, dollars spent on pollution control, and on and on. All of this information is helpful and meaningful at some level in judging our progress. But the overall success of the national program, State programs and local programs must be judged more wisely, more comprehensively than in the past. We need to develop indicators of success based to the extent possible on environmental results, not just administrative actions. EPA is now working to achieve this for the water program and we have reduced the administrative "beancounting" requirements previously imposed on States in order to move towards a more meaningful measurement of progress in achieving health and environmental goals. We will continue to work with States and other federal agencies to improve our ability to judge success in a way that fosters innovation on site-specific solutions.

FUNDING

As we work to address the remaining threats to our Nation's waters, we must also recognize that new initiatives place a significant increased burden on State and federal water quality protection programs. Without adequate funding, State and local water and wastewater programs will not be able to fulfill the mandates of the CWA or meet the expectations of the public. Therefore, we need to be sure that adequate resources are available—and available for the right purposes—in order to ensure continued progress in protecting water quality.

In 1981, the federal government committed to a ten-year program of \$2.4 billion per year for financing the construction of municipal wastewater treatment facilities under the CWA's Title II Construction Grants Program. This level of funding was considered adequate to meet the estimated remaining highest priority needs for interceptor sewers, wastewater treatment plants, and sewer rehabilitation projects to correct infiltration and inflow problems. Other major infrastructure needs, such as correction of combined sewer overflow (CSO) pollution problems, were not fully considered in the 1981 plan. In 1987, Congress established the State Revolving Fund (SRF) program to provide long-term financial assistance for municipal wastewater infrastructure needs, and phased out the Title II construction grant program. A total of \$18 billion was authorized for these two programs through fiscal year 1994, principally to assist municipalities with their remaining municipal sewerage needs and to start to address the more recently identified needs such as CSO correction. The SRF program also provides support for nonpoint source and estuary management activities.

The transition from the Title II construction grant program to the Title VI SRF program has gone well. All States now have approved programs and are receiving capitalization grants. Over \$7 billion dollars of federal capitalization funds and \$6 billion of State matching funds and bond proceeds have been made available for needed wastewater projects. More than 1300 municipalities have received low interest loans through the SRF. Approximately 70% of the loan assistance provided to date has been for financing the construction of secondary and advanced wastewater treatment plants. Another 25% has been used for sewer construction, with the remaining 5% available for storm water and nonpoint source management and other projects.

Although EPA has not yet published data from the 1992 survey of the States regarding needs for municipal wastewater treatment, preliminary estimates confirm that needs continue to grow. Total documented needs have increased in constant dollars from \$90 billion in 1988 to \$108 billion in 1992. In general, this increase is caused by one or more of four factors: (1) continued population growth and redistribution; (2) deterioration of older sewers and other facilities; (3) new requirements to protect water quality; and (4) newly eligible activities. For example, advanced treatment needs have grown by \$10 billion in constant dollars because secondary treatment controls have proved insufficient to meet water quality standards. Documented needs for CSOs have increased by \$5 billion largely because the costs of CSO con-

trols are better understood today. The \$3 billion increase for new collectors is attributable to population growth and redistribution since the last survey.

As daunting as these figures are, there is reason to believe that some needs are seriously underestimated. EPA, States, and localities are still determining how to meet CWA requirements for CSOs and storm water management; therefore, the documented needs may not yet fully reflect the costs of correcting these problems. In addition to sewer and wastewater treatment construction needs, States reported information on two new significant categories of needs prompted by new mandates of the 1987 amendments: storm water pollution management and nonpoint source pollution control. The estimates reported for these two categories in the 1992 survey are at least \$10 billion in constant dollars. And, we have no precise estimate regarding the funding needed for aquatic ecosystem protection and restoration.

In general, States and local communities cannot afford these activities without continued federal support. Because of its revolving fund characteristic, over a twenty year period the SRF can fund three times the value of projects that could be funded by outright grants. Consequently, while \$18 billion was authorized in 1987 to end federal wastewater assistance, the President is seeking a new authorization for clean water State revolving funds to help communities address these new storm water needs, as well as traditional wastewater needs. The President's investment proposal would provide \$7.2 billion in capitalization grants between fiscal year 1994 and fiscal year 1997 to capitalize these State revolving funds.

WATERSHED PLANNING

The principal goal of the CWA is to protect and restore waterbody uses by ensuring their biological, chemical and physical integrity. As the water program matures, we are expanding our focus beyond a simplistic emphasis on chemical pollution to one that provides a greater understanding of ecosystems. Therefore, EPA strongly supports what we call the "watershed protection approach," which is a way of promoting a more holistic, targeted approach to the complex and often persistent problems in watersheds around the Nation. By focusing on the important stressors within each unique watershed rather than trying to apply the same remedies to all watersheds, we believe that we can address the watershed's problems more comprehensively, efficiently and effectively, and at the same time take better advantage of the energy and resources of our public and private partners.

We can no longer assume that "national" solutions will solve all local problems. By adding a stronger geographically-based approach to protecting our aquatic resources, we can ensure that solutions—shaped by the local community as well as by State and federal participants—are carefully tailored to address the highest priorities and unique circumstances facing each locality. This local tailoring can help ensure that we achieve the dual goals of adequately protecting our water resources and doing it in the most cost-effective fashion. We plan to continue working with USDA's Soil Conservation Service in delivering the watershed approach where watersheds are predominantly agricultural. And, we will work with the Forest Service and the Bureau of Land Management to deal with pollution emanating from federal lands. As we build partnerships, we concentrate our resources on locally targeted problems, foster new, innovative approaches and solutions, and promote implementation of these solutions through the empowerment of local stakeholders.

The watershed approach is not new to EPA and components of the approach have been used effectively in several geographically-targeted programs, including the National Estuary Program (NEP) and initiatives focusing on the Great Lakes, the Gulf of Mexico, and the Chesapeake Bay, and the Near Coastal Waters Program. For example, the Great Lakes Program establishes a partnership of the federal government and appropriate State, tribal, and international agencies to work together in remedying the problems facing the lakes, which together comprise 20% of the world's supply of fresh surface water. The Chesapeake Bay Program calls for EPA and other federal agencies, in concert with the Bay States, to implement programs to abate pollution for the protection and restoration of living resources in this wonderfully vigorous estuary—the largest in the U.S. Under the NEP, States nominate and EPA selects nationally significant estuaries threatened by pollution, development, or overuse. EPA, other federal agencies, the States, local governments, interest groups, and the public jointly identify problems, and develop and carry out comprehensive management plans to protect these recognized estuaries. In addition, by adopting State water quality standards, States tailor water uses and criteria to meet unique, local requirements. Yet these are only a start. We must evaluate the watersheds individually and let the people who depend on them have a principal role in deciding what solutions may be appropriate.

In order to promote integrated planning and watershed protection, I believe we need to provide incentives to the States to develop plans, on a watershed basis, for all impaired and threatened waters, as well as waters that the State determines need special protection or restoration, such as outstanding national resource waters, wetlands, estuaries and drinking water supplies. We are currently examining options for appropriate incentives.

We must also apply a similar approach for the Nation's ground waters. We are increasingly finding that in certain watersheds ground water recharge to surface waters can be a critical factor in determining the ecological health of aquatic systems. We need to ensure that ground water is incorporated into our watershed approach when it significantly influences surface water quality, and we need to guard against the possibility of transferring a pollution problem from surface water to underground sources of drinking water.

I believe the CWA generally provides EPA and the States with the authority we need to look holistically at the entire aquatic ecosystem. By focusing our attention on watershed management in the context of reauthorization, however, I would like to encourage Congress to promote this approach by: harmonizing, and where necessary, improving our ability to address the physical and biological, as well as chemical, integrity of our Nation's waters; emphasizing watershed-level ecological risk management; coordinating water quality standard reviews; consolidating planning and priority setting requirements under the Act; and modifying the timing of biennial water quality assessments and reporting under 1305(b).

The watershed approach I have sketched focuses on carefully-tailored, cost-effective solutions to address important sources of risk to the watershed, including nonpoint source pollution, habitat degradation, wetlands loss, and threats to ground water. I believe that by focusing on watersheds as a whole, we can better identify causes and effects of high-priority problems and develop effective, practical solutions while at the same time maintaining strong national programs to protect the gains of the past. The watershed approach is essential to ensure that we succeed in restoring and protecting the Nation's aquatic resources. I would also like to point out that the application of the watershed approach does not imply a backsliding of current requirements. For example, national secondary treatment requirements would remain, and the focus would be on eliminating threats that are not addressed through such requirements.

POLLUTED RUNOFF (NONPOINT SOURCE POLLUTION)

Polluted runoff, which is the contaminated runoff from agricultural lands, grazing and forestry operations, and those urban areas and commercial activities not regulated by NPDES permits, is one of our most vexing water quality problems. Siltation, nutrients, and pathogens are the most common pollutants causing the degradation, which is also known as nonpoint source pollution. In addition, polluted runoff stemming from increased population growth in sensitive ecosystems, such as in coastal areas and wetlands, also poses a serious threat to waterbody integrity. Much of the most serious pollution comes from agricultural runoff, including crops, grazing, and animal waste.

Polluted runoff most commonly results in damage to natural ecosystems, including alteration and destruction of habitats. Fertilizer use, and other activities such as faulty septic systems, inadequate waste water treatment facilities, industry, feedlots, and pesticide use have also been linked to contamination of ground water. These problems are particularly acute in rural areas of intense agricultural activity where ground water is used as the primary source of drinking water for 95% of the population.

We already possess some tools to help. Section 319 of the CWA, enacted in 1987, required States to assess their nonpoint source problems and to develop programs for managing nonpoint source pollution, backed by federal grants. The Coastal Zone Act Reauthorization Amendments of 1990 provided a somewhat stronger approach for coastal areas in 29 States and territories, centering on new State programs to implement the best available management measures economically achievable for categories of nonpoint sources, i.e., agriculture, silviculture, urban activities, marinas, hydromodification, and loss of vegetated ecosystems. The new State programs will also provide for the implementation of additional management measures as necessary to achieve and maintain water quality standards and protect designated uses. We believe that these coastal nonpoint programs will represent an important tool in the restoration and protection of our Nation's impaired and threatened coastal waters. The 1990 Farm Bill also helps, especially through its Conservation Reserve and Conservation Compliance, and Wetlands Reserve programs.

The CWA recognizes that States and local governments should play major roles in addressing polluted runoff because of its diffuse nature and because of the need for broad-based teamwork to identify and implement the solutions. Over the last four years, we have provided both technical assistance and over \$190 million in financial assistance to help States with approved nonpoint management programs provide technical assistance, education, and implementation of best management practices, both State-wide and in priority watersheds. In addition to the \$50 million per year currently being appropriated for nonpoint source grants, the President is proposing to invest an additional \$180 million in nonpoint source grants between fiscal years 1994 and 1997. These investments would help restore watersheds currently being degraded by polluted runoff.

We believe that we and our many partners are making progress with these and other tools. Based on my experience in Florida, however, I believe that State and federal programs alone will not work. Local initiatives, commitments and incentives are crucial to creating the sense of volunteerism and long-lasting change that will be necessary for success.

At this stage, I believe there are several basic principles that should guide our discussions of the problem of polluted runoff. Specifically:

- While § 319 nonpoint management programs provide a good starting point, stronger measures are needed.
- A stronger watershed focus should be brought to bear so that farmers, foresters, and other stakeholders can better understand the connection between what they do on the land and the benefits they can help to bring to water quality.
- Where feasible, pollution prevention should be the approach of first choice for addressing polluted runoff.
- Voluntary, targeted approaches should remain the primary focus, but backup enforcement requirements at the State and federal levels are needed when voluntary approaches fail to produce adequate incentives and necessary environmental improvements.
- EPA should help to set clearer performance expectations and technical baselines for nonpoint source controls and management practices. We must improve our scientific understanding of the transport, impacts, and means to control problems such as nutrient and siltation pollution, and improve the tools to address them. In the effort, we will need to work closely with other federal agencies, such as the National Oceanic and Atmospheric Administration, the U.S. Department of Agriculture and the Departments of Interior and Transportation.
- We should encourage innovation where appropriate, including public-private partnerships and greater use of market-based incentives. Federal funding should support State and local actions but should not be a prerequisite to accelerating progress.
- We should also work closely with other federal agencies to provide for the implementation of similar programs on large tracts under the stewardship of Federal land management agencies.
- We should set clear expectations that water quality programs will be focused on aquatic ecosystem protection, not just on the water column.

OTHER WET WEATHER FLOW ISSUES

Storm Water

Storm water is a major program area in which EPA and the States together have made some important progress. As you know, the 1987 amendments to the CWA required the Agency to establish a two-phased regulatory program to address the discharge of contaminated storm water to our Nation's waters. States have reported that storm water discharges from diffuse sources are responsible for approximately one third of remaining assessed surface water impairments in lakes and estuaries.

With the promulgation of the Agency's Phase I storm water regulations in November 1990, implementation of the program is well underway. Over 100,000 industrial activities and more than 250 municipalities and counties are covered under Phase I. To date, tens of thousands of facilities and storm water activities are covered under general NPDES storm water permits (although many more remain to be permitted). EPA and the States are now beginning the more difficult process of assuring that necessary controls are implemented as required by those permits. We are in the process of developing individual NPDES permits for municipalities and counties covered under Phase I. Both EPA and the States have placed a very heavy

emphasis on pollution prevention and implementation of best management practices as the first step in implementing storm water programs.

While Phase I is a major challenge and much more work remains, Phase II of the storm water program represents an even larger undertaking with as many as one million additional commercial, retail, and light industrial activities potentially affected. Also potentially included in this Phase II group are municipalities under 100,000, as well as emerging growth and new development areas around existing urban centers that are not covered under Phase I. A number of issues must be addressed in connection with the implementation of Phase II, notably whether certain dischargers should be targeted for permitting before others, the possible menu of regulatory and nonregulatory mechanisms that could be used to address high priority sources, and appropriate deadlines.

We are presently developing different options for a Phase II strategy that will provide for the most effective targeting of high risk sources, identify appropriate roles for federal, State and local government, and strike the right balance between pollution control under the nonpoint source program and the issuance of permits under the NPDES program. We think potential Phase II sources outside urbanized areas may best be addressed under an expanded and strengthened nonpoint source program.

Combined Sewer Overflows

Another remaining point source problem is combined sewer overflows (CSOs). More than 1100 cities (85 percent of which are located in the Northeast and Great Lakes areas) which serve a total population of 43,000,000 have antiquated combined sewer systems. During wet weather events, uncontrolled combined sewer systems discharge raw sewage, commercial and industrial wastes and storm water. States' water quality assessments have shown CSOs to contribute to water quality impairments, beach closures, fish kills and shellfish bed closures.

In 1989, EPA took steps to address the CSO problem by issuing a CSO Strategy calling for States and municipalities to focus greater attention on controlling CSO discharges such that waters impaired by CSOs would attain water quality standards. EPA has recently circulated a new draft Combined Sewer Overflow Control Policy that provides additional guidance on meeting the 1989 CSO Strategy. Through negotiated dialogue with State, environmental, and municipal representatives, the draft policy developed a framework for future action. Public comment has been supportive of the draft policy. The draft policy contains provisions for developing appropriate, site-specific NPDES permit requirements for all combined sewer systems that overflow as a result of wet weather, including requirements to ensure attainment of water quality standards. The policy also announces an enforcement initiative to require immediate elimination of overflows that occur during dry weather. The existing statute appears to provide sufficient legal authority to implement the draft policy and to bring CSOs into compliance with statutory requirements, including the attainment of State water quality standards.

POLLUTION PREVENTION

We must also focus on pollution prevention. In the water program, as in other environmental programs, traditional end-of-the-pipe approaches have yielded significant gains in environmental quality. However, we now realize that treatment and disposal will not be sufficient to ensure continued progress and that end-of-pipe approaches can raise costs. A more comprehensive, cost-effective prevention-oriented approach within our base regulatory program will allow us to move even more effectively toward meeting the overall goals of the CWA.

There are numerous other benefits offered by implementing a pollution prevention philosophy. By reducing reliance on end-of-pipe or permit-by-permit controls, prevention also reduces the likelihood that a "solution" to one pollution problem will simply transfer significant risks from the residual pollutants to different media. In particular, we have seen the transfer of surface water contamination to ground water contamination. Pollution prevention approaches, such as switching to different process solvents and reducing water use, have the potential to produce permanent solutions to environmental problems—solutions that require less investment in expensive pollution control and greater emphasis on good planning and strategic designs. Pollution prevention includes conservation techniques and changes in management practices to reduce significant adverse effects to sensitive ecosystems and resources such as wetlands, ground water and estuaries. In addition, prevention may be the most cost-effective way to address many of the remaining sources of water pollution such as agriculture and urban runoff, the cumulative effects of in-

cremental habitat loss, or numerous small sources, which can result in significant impairments of our water resources at the local level. Pollution prevention also complements the watershed approach. It offers additional tools that give us greater capability and greater flexibility to address localized problems requiring heightened attention.

TOXICS/WATER QUALITY STANDARDS

The goal of the CWA is to "restore and maintain the chemical, physical, and biological integrity of our Nation's waters." Under this mandate, we have developed sound programs to reduce point source discharges of pollutants entering all surface waters, including lakes, rivers, estuaries, oceans, and wetlands. Under the CWA, EPA develops national uniform effluent limitation guidelines, new source performance standards, and pretreatment standards for categories of industries, such as electroplating, pharmaceutical manufacturing, and textiles. These effluent guidelines and standards generally reflect application of the best available technology that is economically achievable. They also include best management practices. Early guidelines covered roughly 129 toxic pollutants, while our more recent guidelines have covered over 400 toxic pollutants. Sewage treatment plants, in turn, are subject to secondary treatment requirements. Those regulations set end-of-pipe performance standards, based on the treatment technology available at the time, allowing dischargers flexibility in choosing the method of compliance.

The Clean Water Act gives States the primary responsibility to develop water quality standards for waters within their jurisdiction. State water quality standards provide the basis for many federal and State water quality management decisions. In developing these standards, States designate specific uses for their waters—such as fishing, swimming, or drinking—and, adopt criteria to protect these uses. Traditionally, criteria are pollutant-specific and define levels of pollutants that will not interfere with the designated use. States typically use both national criteria guidance issued by EPA and other scientific information to develop their standards. Recently, through State and federal rulemaking, numeric water quality criteria for "priority" toxic pollutants, are now in place for waters impaired or threatened by those pollutants. However, as States' own water quality assessments point out, chemical-specific standards alone are inadequate to protect waters from the greatest threats to their full use. EPA is therefore developing criteria guidance for States to use in adopting standards to address physical and biological parameters. In addition to uses and criteria, State water quality standards programs must include an antidegradation policy to ensure that existing uses and high quality water resources are maintained and protected. States must review their standards every three years to ensure that they remain adequate to address emerging problems, reflect new scientific and technical information, such as additional criteria that may need to be adopted to fully protect designated uses, and are updated to account for improvements gained.

Historically, EPA has emphasized chemical-specific pollutant criteria to address impairments in our Nation's waters. Not only the goals of the Act, but also the condition of our waters have convinced us that EPA needs to focus not only on the chemical, but also the physical and biological components of the aquatic ecosystem. We need to set priorities—and to involve the public, States and federal resources management agencies in setting priorities—so that we focus our criteria development resources on the highest priority problems where we can get the greatest reduction in risk. As a result, we would have a sounder basis for devising solutions to the problems causing the greatest impairment of our waterbodies, including habitat destruction and species loss and reduced diversity.

ENFORCEMENT

Essential to the success of the CWA is the presence of a vigorous enforcement program. Enforcement and the manner in which we exercise the discretion to use enforcement tools remain an integral component of a successful environmental program. One successful example of EPA's enforcement effort is the National Municipal Policy, under which States and EPA assured municipal facilities met the CWA July 1, 1988 statutory deadline for wastewater treatment. Largely as a consequence of the National Municipal Policy, of the 4,000 major municipal NPDES permittees, the number in significant non-compliance has decreased from an average of 150A in fiscal year 1986 to 90A for the first quarter of 1993. In 1987, 74% of the municipal facilities had installed treatment necessary to meet basic technology-based requirements. In 1993, that number has increased to 97%.

EPA has also implemented an aggressive administrative and judicial enforcement program. In fiscal year 1992, EPA took approximately 1450 formal enforcement actions under the CWA. Of these, 272 involved the assessment of penalties totalling \$23,066,200. Further, over the period of time from 1989 through 1992, the average judicial penalty has increased from about \$ 143,800 to about \$414,500. The average administrative penalty has also increased over the same time period from \$17,080 to \$22,895. Since 1975, the Agency, along with the assistance of the Department of Justice, has concluded 904 judicial cases and, since 1987, 802 administrative penalty cases, for a total of over \$125 million in penalties.

CONCLUSION

Reauthorization of the CWA provides us with a valuable opportunity to focus on the most important problems facing our Nation's waters and to address them in a realistic, implementable way. We believe that controlling of polluted runoff can and should be the single greatest achievement of an amended Clean Water Act. We also believe that adopting a watershed protection approach to protect the biological and physical, as well as the chemical, integrity of our Nation's waters is very important. Similarly, we recognize that we must increase our emphasis on pollution prevention as the most practical and cost-effective means of meeting the goals of the Act. In addition, in concert with a strong point source program, we must focus considerably more attention on the sources of polluted runoff and wet weather flows; we cannot forget that these pollution sources contribute heavily to the persisting impairments our waters experience. We must undertake to streamline the process of administering and enforcing the CWA. We must consider how to better address ground water protection.

I recognize that I have described a large task, but our Nation's waters issue us a stark challenge that we cannot ignore, except at our own cost. I believe you share with me a respect for the purity of our streams, the diversity of life in our estuaries, the high productivity of our wetlands, the dynamic interplay of forces in our watersheds, and the safety of our drinking water. Therefore, I look forward to working with you, Mr. Chairman, this Subcommittee, the Members of Congress and their staff, our sister federal agencies, State and local governments, and industry and environmental groups to meet this challenge.

SUBMISSION BY WILLIAM COOPER, INSTITUTE FOR ENVIRONMENTAL TOXICOLOGY, MICHIGAN STATE UNIVERSITY

REPORT FROM THE FORUM OF SCIENTISTS: REAUTHORIZATION OF THE CLEAN WATER ACT

[NOTE: The following has been excerpted from the above named report. The report, in its entirety, has been retained in committee files.]

Introduction

The SAB report entitled *Reducing Risk* submitted to the USEPA in November 1990, identified several ecological risks that deserved equal attention to those dealing with public health. As a follow up, I was asked to assemble a group of scientists to explore how the reauthorization of the 1972 Clean Water Act could be used to address these remaining environmental problems that are critical to the long-term economic, ecological and human health components of our quality of life. In particular, we were asked to identify and rank the most important environmental risks associated with our aquatic ecosystems. Furthermore, specific suggestions were made as to how these scientists would address these problems. The analyses and recommendations of our group will now be reviewed by comparable groups of economists and lawyers. These deliberations will then be used by the USEPA as they develop their strategy for the reauthorization in 1992.

The members of the Forum are given in Table I. We met for 1 and 1/2 days at Michigan State University in late February 1991. The report is organized in four sections:

- I. General Comments: Generic issues that are not pollutant or program specific.
- II. Nutrients and Hazardous Chemicals: Specific pollutants and institutional responses.
- III. Habitat Loss and Species: Basic concepts and priority problems.
- IV. Infrastructure and Institutions: Generic problems associated with federal institutions.

We only had time to focus on those residual risks that we thought to be high-high, medium-high and low-high. There are many risks that we considered low similar to those in the SAB report. These were not discussed in detail.

Generally, the feeling was the Clean Water Act of 1972 has done a very good job of protecting our water resources for those issues that were of primary interest in the 1970s. Combined sewer overflows and many persistent toxics remain priority problems. Nutrient loading of nitrate, phosphate and organic matter of marine estuaries are potentially a very big problem. Other significant risks still exist because the source of the stress was not addressed or was explicitly exempted from the initial act. Agricultural policies and practices, habitat destruction and the introduction of exotic species are the most important new issues that must be incorporated into the reauthorization. The detailed rankings, the logic for the rankings, and the recommendations for reducing risk are all included in the individual sections.

I. General Comments:

The Clean Water Act (CWA) must recognize the dependency of *sustainable* economic development and public health on self sustaining aquatic ecosystems. The CWA must be broadened to incorporate ecological as well as public health dimensions.

Also, the preamble to the CWA should provide the reader with the clear understanding that "human health related to drinking water quality must be protected under the CWA. The CWA must provide the same status for drinking water protection as it does for protection and propagation of fish, shellfish, wildlife, and recreation. The risks to public health from failing to deal with drainage and human pathogen loading resulting from agriculture, inadequately treated sewage and, in some cases, stormwater runoff are significant, documented, and thus deserves equal ranking with the above issues.

It should also be stated in the CWA that the Safe Drinking Water Act emphasizes source water protection and encourages water purveyors to use supplies from the highest quality source. The CWA must recognize the human health benefits associated with procuring such high quality supplies and that such procurement may result in impacts to wildlife habitat. There must be a mechanism to mitigate those impacts that is clear, consistent and enforceable, and allows for the rational protection of drinking water supplies.

Issue: Act title and goals do not encompass critical problem areas.

Problems and Risks: The perspective and orientation of those administering the Clean Water Act is established in large measure by the Act's title and goals. At present, the Act doesn't encompass physical alteration of habitat and other significant ecological issues.

Solutions: Retitle the Act along the lines of "Aquatic Resources Protection Act" or "Clean and Habitable Water resources Act" or "Watersheds, Oceans, and Wetlands" Act.

Establishment of an Advisory Committee, perhaps under the EPA Science Advisory Board, would provide a mechanism to introduce state-of-the-art concepts and technologies that can guide future amendments to the CWA. The group could consist of twenty scientists, engineers, economists, lawyers, and sociologists, all of whom have contributions to the maintenance and improvement of water quality.

An annual report on the state of water quality should be prepared and published for the public. If introduced to the public initially through the communications media, such a report could initiate and maintain an awareness of concerns about the most important commodity regulated by EPA.

Issue: Scientific review of toxic pollutants and hazardous substances.

Problems and Risks: presently a list of Toxic ("priority") Pollutants (Section 307) forms the basis for setting effluent limitations and levels of Best Available Treatment Technology Economically Achievable (BACTEA). Originally developed by the House Committee on Public Works and Transportation (Committee Print No. 95-30), the list has never been subject to scientific peer review and has remained imperfect and unprioritized. Similarly, the list of Hazardous Substances (Section 311) that designates discharge limitations has never received adequate review. The background data that were used to justify listing have been criticized for inconsistencies but have not been revised. Neither list has been substantially refined since their creation. This causes a misapplication of the Nation's resources for monitoring and treatment inasmuch as resources that could be applied to high-risk problems are now applied to many problems that pose negligible risk. Also, no provision exists for adding new, scientific identified pollutants that are judged to have a reasonable chance of causing problems.

Solutions: Reauthorization of the Clean Water Act offers an opportunity to rectify the shortcomings of ambiguous and scientifically unjustified listings. Although the EPA Administrator has always had authority to revise the Toxic Pollutant list upon reviewing toxicity, persistence, degradability, and effect, revisions have only rarely been made. Some present listings are either environmentally insignificant, analytically ambiguous, or have never been commercially produced or quantitatively detected.

Sections 307 and 311 listings should be opened to public review, comment, and change; deletions or additions should be based on consensus scientific peer review. Environmental issues should address multimedia concerns, but avoid indiscriminate transfers of lists that were developed for other purposes and lack scientific review.

Issue: Adequate Federal Funding

Problems and Risks: Vital water quality protection programs mandated by the CWA will not be achieved without adequate federal funding to finance resultant increases in state program costs.

The 1987 amendments to the CWA established several new federal mandates for water quality protection. Examples include (1) identification of waters that are impacted by toxics and establishing clean-up strategies; (2) issuing storm water discharge permits for many different discharges; (3) establishing enforceable numerical water quality criteria for state waters; and (4) addressing non-point sources of pollution. EPA has focused increased attention on combined sewer overflows. These amendments have greatly increased permit requirements to include sludge, storm water, and toxic controls and have increased the monetary costs of implementation.

These new federal mandates are important initiatives and must be pursued if the surface waters in the U.S. are to be protected. Federal funding to assist states in this effort, however, is decreasing. For example, the 1987 amendments terminated the construction grants program and replaced it with the State Revolving Fund (SRF) program that provides low-interest loans to municipalities. But, the federal support for the loan program is short term, and starting in 1992, it will decline to zero federal involvement after 1994.

Federal program support has also decreased. For example, a 4% set-aside of the \$100 million/year construction grant allotment was previously authorized for state water program support. These funds are no longer available.

Although federal support for state programs under Section 106 increased slightly in 1991, it is still seriously inadequate to address increasing program demands.

Solutions: The federal government must increase its participation in funding the new water quality protection programs that are mandated by federal law.

1. The new Act should maintain the federal participation in the SRF at the 1991 level (authorized at \$2.4 billion nationwide).
2. The state program grants under Section 106 of the Act must be enhanced to provide necessary federal support for major new federal programs such as the storm water permitting, sludge management programs, and modernized waste water discharge criteria to the marine environment.
3. Non-point sources of pollution remain as a persistent problem that impacts surface waters. Section 319 of the Act provides federal funding for non-point source demonstration projects (\$70 million for FY 88, \$100 million per year for both FY 89 and FY 90, and \$130 million for FY 91). Federal appropriations, however, were not made during the first two years of this authorization. Continued funding for a true four-year period, as envisioned in the 1987 amendments, is needed to adequately demonstrate available and effective non-point source management practices.
4. Consideration should be given to creation of a Federal Aquafund similar to Superfund. The Aquafund would provide federal funds targeted for cleanup of critical, high-risk areas of contamination in the nation's surface waters systems. It is appropriate for corporations that produce the materials that create these in-place pollutant problems to bear the cost of long-term remediation and scientific research.

Issue: Long-term Research Investment

Problems and Risks: As our ability to detect toxic, persistent chemicals at very low levels continues to improve, we are beginning to find chemicals almost everywhere in the aquatic environment. Understandably, this heightens public concern and can lead to the perception that all trace contaminants pose serious health threats. However, any such threats must be evaluated scientifically, not emotionally. The mere presence of toxic chemicals, or even evidence of their uptake by organisms, does not automatically signify that biological impact is occurring. Conversely, neither does the absence of obvious problems constitute proof that the chemicals are harmless. They could be exerting small, cumulative effects which may take a long

time to become manifest yet are profound. Confounding this problem is the large discrepancy between our technical ability to analyze chemicals, which is quite sophisticated, and our scientific understanding of their impacts, which is rather naive. What is needed is the ability to link the presence of contaminants in the environment and their bioaccumulation in organisms (or their conversion products) to the resulting biological effects. state-of-the-art research, which is now addressing this critically important area must be encouraged and used by decision makers if sound judgments are to be made on the relative dangers of different complex mixtures of chemicals in our environment.

Cases of pollution caused biological effects have only been documented in highly contaminated areas. Highly contaminated sites are relatively rare, and represent worst-case situations that are largely beyond repair. Of equal concern should be the greater number of sites that exhibit low-to-moderate levels of contamination where remediation or restoration would be feasible. Such conditions might be causing adverse effects that are too subtle to detect and yet they represent the majority of sites. Such subtle effects, which have so far been overlooked, may lead to devastating consequences.

Finally, the present version of the CWA is based, in part, on outdated science and includes inadequately reviewed information. For example the Act's list of Toxic "priority" Pollutants (Section 307) was neither subjected to scientific peer review initially, nor has it been substantially refined since then. Yet, in the intervening years, published research studies have indicated changes in the status of many chemicals of concern (e.g., concern has increased for organometals and coplanar PCBs, while concern has diminished for ODT). Similarly, even though important new findings or techniques have been developed over the last few years, they have often not been adopted by those enforcing the CWA. Biochemical studies, for example, have revealed that it is not useful to measure certain contaminants (e.g., aromatic hydrocarbons) in certain tissues of some species because they have been bioconverted into other compounds. Rather than continuing to expend resources looking for something that won't be found, emphasis should be placed on developing ways of measuring the conversion products (metabolites). In other cases, a new methodology may be available, such as a rapid way to screen fish bile for exposure to aromatic hydrocarbons, yet those enforcing the law are resistant to change and persist in using more time-consuming, costly, and outdated techniques.

Solutions: Prior to taking remediation or restoration steps, we need to develop a scientifically sound information base that relates the extent and duration of chemical exposure in various key species to significant biological effects. A suite of indices needs to be developed for assessing small alterations in biological processes, such as reproduction or growth. Actions taken without adequate information will lead only to stop-gap measures and can result in multi million dollar mistakes.

A significant portion of federal funds in the reauthorization act should be targeted for development of a better understanding of chemically-induced alterations in vital biological processes in aquatic species, particularly development of indices to measure contaminant exposure and effects.

The reauthorized CWA should establish a strong, long-term commitment in development of the necessary scientific information base.

Present regulatory and monitoring efforts do not allow flexibility for adoption of newly developed indices. A concerted effort must be directed toward scientific evaluation of newly developed tests and implementation, where appropriate, into existing programs.

The CWA should be amended to include the impacts of contaminant and nutrient loadings on habitat. Regulations must be added to try to prevent such toxic inputs.

Issue: Ecosystem Quality of the North American Great Lakes (Section 118, Great Lakes)

Problems and Risks: Nutrient inputs to the Great Lakes from non-point sources cause increased primary productivity and eutrophication. Toxic chemical input to the Great Lakes, primarily from non-point sources (atmospheric deposition, in-place pollutants) degrades water quality, impacts the food web, affects the biological functioning of higher organisms, presents increased risk to consumers of chemical-laden fish (e.g. birds; humans) and adversely impacts the commercial and recreational economy. In place contaminants in sediments can degrade the benthic food web and remain as sources of contaminants to the water column for decades and even centuries. Short range and long range atmospheric transport and deposition of toxic chemicals remains a significant hazard to the water quality.

The Great Lakes are a valuable national resource that need to be protected for future generations. With the availability of high quality water decreasing and with

pressures from climate change, ozone depletion, urbanization, and wetland alteration increasing, proper stewardship of the ecosystem is demanded.

Solutions: The US should actively pursue the goals and objectives of the Great Lakes Water Quality Agreement of 1978 as amended in 1987. The EPA, through its Great Lakes National Program Office (GLNPO), should vigorously lead the monitoring, surveillance, research, and development of solutions to the problems of in-place pollutants, release of exotic organisms (e.g., sea lamprey; Zebra mussel; alewife), eutrophication, and toxic chemicals. This must be done in collaboration with relevant Canadian agencies, and all the relevant states. The EPA and the GLNPO must be held to increased accountability for mandated programs through the 1990 Clean Air Act, the 1987 Clean Water Act, and the Great Lakes Water Quality Agreement and Amendments of 1987. Although monitoring and surveillance of toxic substances is mandated, little has been accomplished. Research in support of the Clean Water Act and Clean Air Act goals has been minuscule. The GLNPO/EPA should work in concert with the Great Lakes Environmental Research Laboratory of NOAA and with sponsored research programs to university researchers to answer important questions.

Issue: Determination of the impact of man-induced environmental changes on living resources (Section 117, Chesapeake Bay)

Problems and Risks: The coastal zone receives hazardous chemicals from numerous point and non-point sources. Many of these substances sorb to sediments and are either transported or stored where sediments accumulate. Since materials from many sources may settle at the same location, sediments are usually contaminated with a wide variety of chemicals. Flora and fauna that reside near to the "contaminated sinks" may be exposed to a complex mixture of hazardous materials.

Existing regulations controlling aquatic chemical pollution usually focus on single chemicals, e.g. water quality criteria or sediment quality, and do not consider the biological response to combined chemical insult. Moreover, biological surveys usually employ methods that are insensitive to subtle changes and fail to detect injury until major changes in abundance or species composition have occurred. Therefore, the impact of anthropogenic chemicals on the Nation's marine and estuarine biota is not being adequately addressed.

Solution: A directed research program should be initiated to determine and utilize new and novel monitoring techniques and endpoints in order to assess the impacts of chemical pollution on the biota of the coastal ocean. These should include, but not be limited to, biomarkers (biochemical, physiological or histological markers of stress), sediment bioassays and detailed analytical chemistry designed to quantify and track as many anthropogenic substances as technically feasible.

Issue: Lack of coordination between monitoring and modeling (Section 320, National Estuarine Program).

Problems and Risks: Monitoring is an inherently expensive activity in terms of time, personnel and equipment. The uses of monitoring data are frequently not well defined and much of it is simply filed away and disappears.

When modelers try to parametrize or validate models using monitoring data, frequently such data cannot, for various reasons, be adjusted to the requirements of the model. There is often a fundamental mismatch between how modelers view a system (conceptionally, analytically, integratively, etc.) and how the designers of monitoring programs perceive it (standard variables, off-the-shelf methods, inadequate spatial and temporal sampling design, inattention to issues of scale and resolution).

Solutions: Appropriations should be identified to support interactive modeling and monitoring programs. Monitoring and modeling efforts should be designed in concert. Modeling should precede monitoring and then the monitoring defined relative to the models. *The modeling-monitoring feedback linkages should be forged interactively.* The models can then be used to aid assessments that monitoring programs were established to perform. As the programs proceed, both models and monitoring should be adjusted to optimize responsiveness to the requirements of the problem.

Issue: Insufficient technical support and regulatory mandate for water quality standards adoption (Section 320, National Estuarine Program).

Problems and Risks: Although the CWA emphasized the use of water quality criteria, issues of inconsistency between states and an overall deficiency of criteria prevails. Chemical-specific regulation of toxics, nutrients and other conventional pollutants is entirely dependent on water quality standards. Without these numerical limits being specified in discharge permits, many substances that can impact the aquatic environment continue to be released.

Solutions: Through the CWA, specific resources should be authorized to support EPA ORD activities designed to develop or obtain from the academic community the

toxicity data necessary for water quality criteria development. EPA should be required to expand water quality criteria development for compounds beyond those on the present priority pollutant list.

Issue: Definition of "real" risks of toxic chemicals.

Problems and Risks: As our ability to detect toxic, persistent chemicals at very low levels (PPB, PPT, PPQ, etc.) increases, chemicals are being detected almost everywhere in the aquatic environment. This heightens the public's anxiety about environmental protection. However, at the present we are able to measure only a few so-called "eleventh hour" effects that seem to occur only in highly contaminated areas. This results in controversy about the potential impact of contaminant loading in the aquatic environment. The unfortunate outcomes are confusion and loss of credibility. At present, therefore, most regulatory, remedial and environmental restoration efforts are initiated primarily because of public pressure and are not based on appropriate scientific information; consequently they are often open to criticism and controversy. In short, the mere presence of toxic chemicals or even documented uptake of organics does not signify that biological impact is occurring. Currently information is urgently needed to relate the extent and duration of exposure to significant biological effects.

Solutions: Prior to any implementation of remedial action program, a series of indices need to be developed that measure alteration in normal biological processes necessary for proper functioning of important components (critical individual organisms) of the ecosystem. These indices (bioindicators or biomarkers) should be chosen so their alterations can be clearly linked to contaminant exposure or body burdens in key organisms and to vital biological processes (reproduction, disease resistance, health). A suite of such bioindicators (exposure, sublethal responses, effects) must be developed to provide better management decisions. Such methods are being developed in many laboratories; however, the efforts are often fragmentary, because of limited funding and long-term direction. Certain federal funds in the reauthorization act should be devoted to a concerted and holistic effort to develop such an information base. Actions taken without a proper information base will lead only to stop-gap measures and often result in multimillion dollar errors.

The language of the CWA should be modified to provide a strong and long-term commitment in support of research on how and at what level complex mixtures of contaminants produce sublethal effects that may be harbingers of long-term deleterious impact. This effort will probably take several decades to complete.

Issue: Insufficient funding for research related to integrated ecosystem assessment.

Problems and Risks: A jurisdictional gap exists in the support for basic research related to environmentally relevant problems. Most state agencies and the EPA fund only work that is directly related to specific (usually monitoring) questions. Government institutions (e.g., NSF, NIH, NIEHS), on the other hand, are only able to fund extremely basic work directly related to human health. This funding gap has severely hampered acquisition of the information needed for integrated ecosystem risk assessment.

Solutions: Additional (new) sources of funding probably within EPA should be devoted to exploratory research. This work should be conducted by federal research laboratories (e.g., NOAA, EPA, DOE) as well as the academic research community, since diversity of scientists brings in different and valuable perspectives to the issues.

Issue: Development of appropriate data to assess ecosystem health.

Problems and Risks: The 1987 amendments to the CWA and the SAB reports stress the need for integrated ecosystem risk assessment to protect the health of our aquatic resources. Although some of the techniques needed for this process are already available, others need to be developed. Such measures should at a minimum assess: 1) the fate, persistence and availability of contaminants; 2) contaminant exposure in target organisms; 3) mechanisms of action of toxics; 4) reproduction and population fitness; and 5) ecosystem structure and functioning.

Solutions: Funding should be devoted to developing new approaches to assessing ecosystem health and risk, and the ecological risk community should reach consensus regarding the best approach.

Issue: Regulation of metals by the water quality standards program.

Problems and Risks: The EPA develops water quality criteria which, if not exceeded, will be protective of beneficial uses of the aquatic environment. The criteria for metals are expressed in terms of the dissolved, or "acid soluble", form of the metal. EPA interprets existing regulations as requiring NPDES permit limits on metals to be expressed as total or total recoverable metal. The use of the total measurement for a metal does not recognize that insoluble, complex metals are probably not bio-

logically available and, therefore, not capable of exerting a toxic effect in an exposed organism. This limits the utility of conducting site-specific re-calculations of water quality criteria to account for water quality effects on bioavailability. Significant amounts of any particular metal can occur in the non-dissolved form in an effluent discharge, and regulating by the total form will result in over-conservative control and the misuse of wastewater treatment resources. Long range availability through in-situ volatility, however, must also be considered.

Solutions: Clarify existing language in the CWA to direct that regulatory controls (i.e. effluent limits) be expressed in a form consistent with the underlying water quality criteria. The EPA must also complete and promulgate analytical protocols for the routine determination of acid-soluble metals, and revise existing regulations to allow the acid-soluble expression in permit limits.

Issue: Site specific water quality criteria/standards

Problems and Risks: Water quality criteria and standards must continue to accommodate site-specific conditions which may render a substance less toxic. Examples include complexation or chelation of trace metals which render that fraction relatively non-biologically available or toxic. A case in point may be "complexed" copper and cadmium in marine waters being less "toxic" than the free ion activity.

Recommendations: EPA should encourage and support development of protocols to establish site specific water quality criteria or standards. Regulations for domestic wastewater effluents should be based on the assimilation capacity of the receiving waters. Permits should limit mass loadings per unit time and not specify effluent concentrations or treatment technologies. In the absence of scientifically derived assimilation capacities, BAT limitations should be used.

COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS
 WASHINGTON, DC 20510-6175

October 12, 1993

Dr. William Cooper
 Institute for Environmental Toxicology
 Michigan State University
 C 231 Holden Hall
 East Lansing, Michigan 48824

Dear Dr. Cooper:

The Subcommittee appreciates your participation in the hearings of the Subcommittee on Clean Water, Fisheries and Wildlife in its review of the Clean Water Act. In furtherance of our review, we have a few follow-up questions for the record. Please provide your answers to Bill Leary at 505 Hart Senate Office Building, Washington, D.C. 20510 by October 29, 1993.

- ✓ 1. Can you expand on your comments about the need for peer review? What has been the affect, if any, of not providing peer review under the Clean Water Act? Could you describe what, in your opinion, would be an appropriate and adequate peer review process and the kind of contribution that it would make?
2. A 1988 Agricultural Department study questioned the current ability to identify a direct link between agricultural "discharge" and the water quality of receiving streams. For example, it says: "Offsite damage associated with water pollution cannot be measured directly and links between farming and affected water uses are not well defined. Many assumptions are made to estimate offsite damage, and both methods and data for estimating damage need to be improved." Bradley M. Crowder, Marc O. Ribaudo, and Edwin Young, "Agriculture and Water Quality," Washington: USDA, August 1988, p. 2.

For example, I understand that in one research study of phosphorus loading and nonpoint source pollution in Estonia, the authors concluded that phosphorus stream loadings from intense agricultural operations are quite low, in spite of the fact that phosphorus loadings are high in the fields. The field-generated phosphorus combines with the sediment to prevent stream damage. whereas phosphorus loadings from industrial and municipal sources are highly interactive. E. Loigu, "Evolution of the Impact of Non-point Source Pollution on the Chemical Composition of Water in Small Streams and Measures for the Enhancement of Water Quality," Advances in Water Pollution Control, H. Laikari, ed., 1989, pp. 213-217.

Have we made any progress in establishing a direct link between what happens in a farmer's field and what occurs to the water quality of streams and waters?

- ✓ 3. In looking at pollution prevention as a toll for improving water quality, it is conceivable that in our zeal for pollution prevention, we can and will identify ways to place controls on the front end without necessarily improving water quality, or being able to document scientifically a relationship between the pollution prevention effort and an improvement in stream quality. What recommendations would you make to this committee about the construction of a pollution prevention program to assure that pollution prevention does not become the end itself, but rather that those pollution prevention efforts undertaken will have a measurable and protective effect on water quality?
- ✓ 4. In your report to EPA, you state that restrictions on agricultural and silvicultural practices should be included in any federal program for nonpoint source pollution control. What restrictions did your team have in mind?

Sincerely,

Bob Graham
Chairman
Subcommittee on Clean Water,
Fisheries and Wildlife

November 2, 1993

Mr. Bill Leary
505 Hart Senate Office Building
Washington, DC 20510

Dear Bill:

I was amazed that someone would use a 1988 phosphorus study from Estonia to claim there is no measurable linkage between farming and water quality. I have enclosed three folders of material that I pulled together in just a few days.* The first contains photographs and enforcement actions on agricultural activities in Michigan. These are just a small sample of the more recent enforcement actions. The pictures speak for themselves.

The second folder addresses question two in Senator Bob Graham's letter of October 12, 1993. It contains a collection of articles on agricultural and forestry impacts on aquatic ecosystems. I can produce several hundred more if you need them. In particular, the GAO 1990 (not included) and the NRC 1992 summary reports are very credible.

The third folder contains materials related to question four. Senator Graham asked specifically about recommendations for non-point source pollution control. The specific recommendations are supported by the remaining articles in the folder.

I will attempt to answer questions one and three. The issue of peer review involves the scientific credibility of the regulatory procedures and standards. The water quality standards are often set during times of crisis (Agent Orange, dioxin) and we are forced to use whatever data we have at the time. Generally, the scientific understanding of the toxicant and the mechanism of action comes at some later time. These standards are supposed to undergo a peer review every five years. They almost never do. The "anti-backsliding" provision in the G.L.I. actually prohibits one from relaxing the standard even when new data indicates that it is unnecessarily restrictive.

*The folders referred to have been retained in committee files.

EPA is currently developing new risk assessment models based on mechanisms of transport, fate and effects. These models are being reviewed by the U.S. EPA Science Advisory Board. This process is currently working and should be included in the new Clean Water Act.

The pollution prevention program is justifiable in two ways. Significant pollution is always less expensive to prevent than to remediate after the fact. Case studies have shown that residuals (wastes) that are recycled, reprocessed or reused become resources (inputs) that also save money in the long run.

The characteristics of toxicants (materials) that need to be proactively prevented from being discharged are those that are persistent, are mobile in the environment, bioaccumulate in the ecological food chains, and are chronically toxic in effects. These include the heavy metals and some industrial and agricultural organic compounds. Radionuclides will also fall into those categories. We can demonstrate "bang-for-your-buck" risk reduction with these types of residuals.

I hope these materials are helpful. If you need anymore assistance, please give me a call.

Respectfully yours,

William E. Cooper, Ph.D.
Professor

STATEMENT OF ROBERT J. HUGGETT, PROFESSOR OF MARINE SCIENCE,
COLLEGE OF WILLIAM AND MARY

My name is Robert Huggett and I am a Professor of Marine Science in the School of Marine Science at The College of William and Mary. I am also Chairman of the Department of Environmental Science of the Colleges' Virginia Institute of Marine Science. I have recently been involved with a committee of The Water Science and Technology Board of the National Research Council (NRC) that has been studying ways to more efficiently manage wastewater entering our coastal environment. The result of that effort, **MANAGING WASTEWATER IN COASTAL URBAN AREAS**, has just been released. I would like to take this opportunity to present some of the findings and recommendations contained in the report.

More than a third of all Americans live along a coast, usually in urban areas. Every day, more than 1,400 wastewater treatment plants in U.S. coastal cities discharge 10 billion gallons of treated effluent. Annual treatment costs are between \$1.1 billion and \$1.8 billion. Another 11.3 billion gallons of treated industrial wastewater and spent cooling water is discharged by approximately 1,300 industrial facilities.

In addition, non-point sources of pollution, including urban and agricultural runoff, are a growing problem. Pollution can also come from outside the coastal region—from towns, farms and factories adjacent to rivers flowing to the coast. There are other human activities that can effect coastal marine systems. For example, increased irrigation by farmers can reduce the amount of freshwater flowing into estuaries and over fishing can alter the ecological balance in marine waters.

Current wastewater and stormwater management policies are rooted in the 1972 amendments to the Federal Water Pollution Control Act, reauthorized in 1977 and 1987 as the Clean Water Act. The 1972 legislation asserted authority over the quality of navigable waters such as rivers, lakes and coastal waters. It required establishment of uniform minimum standards for municipal and industrial wastewater treatment, set strict deadlines for compliance, and provided federal funds to help pay for newly required projects.

Under the statute, efforts to protect coastal water quality have focused mainly on regulating city sewer systems and other single-point sources of pollution such as industrial plants. This approach has produced rapid and effective improvements in water quality in many areas, particularly lakes and rivers. However, the law's uniform requirements have not allowed a process that adequately addresses regional variations in environmental systems around the country, or that respond well to changing needs, improved science and more complete information.

To more effectively protect coastal waters from pollution, the nation must begin moving towards a more flexible integrated management approach that takes into account the full range of factors that affect coastal pollution and efforts to control it. The recently released NRC report recommended a more comprehensive approach to managing coastal waters called, "Integrated Coastal Management" (ICM). Broadly speaking, ICM aims to protect by coastal ecosystems while recognizing the importance of human activities, the report says, ". . . the federal role in integrated coastal management shifts from that of prescriptive mandates to a partnership with regional authorities in developing a management system that meets coastal-quality objectives.

The authors of ICM suggest several modifications to the Clean Water Act and the Coastal Zone Management Act, including establishing a "National Coastal Quality Program" as a supplement to the National Estuaries Program. The coastal program should include an integrated planning and permitting process, as well as an "Integrative Action Plan" to supplant Comprehensive Conservation and Management Plans.

The study identifies several key issues that both planner and legislators must consider when thinking about wastewater management. Many of these issues are not effectively addressed by current clean water strategies and point to the need for an integration of functions among many agencies including storm and wastewater agencies, water supply agencies and agricultural agencies.

Treatment Levels. The cost and complexity of treatment are major factors that can vary greatly from area to area. Regional environmental and health concerns also vary. Wastewater treatment levels and related management concerns need to be guided by water quality needs rather than by technology-based regulations.

Excess Nutrient Enrichment. Nitrogen and phosphorus, from both point and non-point sources can deplete dissolved oxygen, resulting in fish kills, algal blooms, and other environmental problems. Secondary treatment of wastewater does not remove significant amounts of nitrogen.

Source Control. These efforts can supplement treatment, avoiding problems before they occur. Source control of pollutants, which is an effective tool for managing both point and diffuse pollution sources, should be strongly encouraged by incentives and regulation. In some cases, for example, tactics such as erosion control may be more effective and cheaper than wastewater treatment of reducing the particulate level of waters flowing into a coastal region.

Stormwater and Combined Sewer Overflows. In many cities, combined collection systems that carry both stormwater and city sewage may overflow. Building new facilities, however, is expensive, and conclusive scientific data on the overflow problem is lacking. Without more research, proposals to legislate technology-based requirements for systems are likely to fail.

Evaluation and Feedback. Management plans must be flexible enough to allow for changes and improvements.

Our ability to manage wastewater in coastal areas has improved greatly over the past decade because of advances in science and engineering. The authors of *Managing Wastewater in Coastal Urban Areas* believe that the concepts set forth in "Integrated Coastal Management" take advantage of our more advanced and creative technical capabilities and offer a better way to both use and protect our coastal environment.

WRITTEN TESTIMONY OF RICHARD A. CONWAY, SENIOR CORPORATE
FELLOW, UNION CARBIDE CORPORATION

Mr. Chairman and members of the Subcommittee:

Good morning. My name is Richard Conway. I am a Senior Corporate Fellow for Union Carbide Corporation. I am appearing today to discuss some issues I feel are important in the context of Clean Water Act reauthorization. These views reflect my technical experience both at Union Carbide and in professional service largely on EPA's Science Advisory Board and on several National Academy of Sciences committees, boards, and commissions. My role at Union Carbide is one of a skill center manager and technical consultant. I speak from that perspective, rather than as a regulatory specialist.

Union Carbide is a worldwide producer and marketer of commodity and specialty chemicals and plastics, employing twelve thousand people in the U.S. Its principal domestic manufacturing facilities are in Louisiana, New Jersey, Texas and West Virginia. More than 25 percent of Union Carbide's revenues are from product exports and licensing of technology in foreign countries.

I. INTRODUCTION

As part of its environmental vision, Union Carbide has publicly committed to reductions in emissions, releases and generation of wastes. Our commitments include the elimination of releases of known and suspect human carcinogens, and the control of the discharge of potentially harmful chemicals to surface water so that concentrations in the receiving stream are substantially lower than any level known to cause adverse health or environmental effects. These serve as important incentives to achieve continuous improvement in our overall environmental performance.

In pursuit of this vision Union Carbide has made significant progress in reducing emissions, discharges and releases to all media, including water. Following is a summary of our accomplishments in reducing water pollution:

SINCE 1987, UNION CARBIDE HAS REDUCED THE RELEASE OF SARA SECTION 313 CHEMICALS TO ALL MEDIA BY 41 PERCENT.

This figure includes a 65 percent reduction in discharges to publicly owned treatment works (POTW's). Union Carbide is committed to achieving a 57 percent reduction in SARA 313 releases to surface waters from 1987 levels by 1996.

FROM 1987 THROUGH 1991, UNION CARBIDE HAS REDUCED ITS EMISSIONS AND RELEASES OF KNOWN AND SUSPECT CARCINOGENS TO SURFACE WATER AND POTW'S BY 90 PERCENT.

An active pollution prevention program relies on an Environmental Management hierarchy of source reduction, recycling, energy recovery, treatment and as a last resort, land disposal to achieve its waste and risk reduction objectives. Goals are set by senior management, are made public, and the corporation reports its progress periodically to the public. Pollution prevention methods employed by Union Carbide

often include raw material substitution, recycling, leak detection and repair, energy recovery, and improved housekeeping.

REDUCTION OF WASTEWATER IS AN IMPORTANT ATTRIBUTE OF OUR KEY PROCESS TECHNOLOGIES, PROVIDING SIGNIFICANT ADVANTAGES TO OUR CUSTOMERS AND THE ENVIRONMENT.

Here are a few examples of Union Carbide products and technologies that help us and others protect water quality:

UNIPOL® Polyethylene and Polypropylene: Products such as plastic milk jugs, food wraps, construction materials, landfill and irrigation liners, and wire and cable insulation are made with this proprietary plastics technology. The UNIPOL® process uses one-third of the energy of conventional high pressure processes, and produces virtually no solid or liquid waste. Both attributes, coupled with superior product performance, are responsible for UNIPOL® technology being licensed around the world, accounting for about 25 percent of world polyethylene production capacity. Compared to conventional high pressure, solvent-based technology, UNIPOL® reduces the discharges to air and water over 97 percent.

Low Pressure Oxo (LPO) Process for Manufacturing Oxo Chemicals (butyraldehyde, propionaldehyde, and valeraldehyde—intermediates for butanol, 2-ethyl hexanol, n-propanol, and valeric acid)

Union Carbide's (LPO) process greatly reduces discharges to wastewater when compared to high pressure processes—LPO discharges to wastewater have over 90% less organics and no heavy metals. High pressure processes, which Union Carbide stopped using in 1983, discharge cobalt as well as organics.

LPO is benefiting the environment world-wide. In part because of its superior environmental attributes, LPO technology licensed by Union Carbide is used for approximately 50% of world-wide oxo chemical production. The latest generation oxo process facility, being built at our Taft, LA plant, is designed to exceed the environmental performance of its predecessors.

CANSOLV® FLUE GAS DESULFURIZATION PROCESS: This innovative technology recovers sulfur dioxide from power plants and industrial processes and can produce sulfuric acid, a marketable commodity. This process consumes about one-third of the energy of a conventional scrubber, and cuts solid waste generation requiring landfilling by over 90 percent. By use of a regenerable solvent in-lieu of a water/calcium hydroxide solution, there is less use of water and therefore less water discharge as a result of scrubbing the SO₂.

INDUSTRY HAS MADE SIGNIFICANT PROGRESS IN REDUCING RELEASES OF TOXICS TO SURFACE WATERS

Industry has made remarkable progress in reducing releases of toxics to our nation's surface waters. According to data reported under EPA's Toxic Release Inventory, member companies of the Chemical Manufacturers Association reduced direct releases to surface waters by 77 percent between 1987 and 1991. Transfers to publicly owned treatment works were reduced by 31 percent.

Further evidence of the progress made by industry in reducing discharges of toxics is found in EPA's National Water Quality Inventory, which is reported to Congress every 2 years. In the 1988 inventory, EPA found that less than 15 percent of the remaining water quality problems were attributed to industrial discharges. Two years later EPA reported that less than 10 percent of the remaining water quality problems were attributed to industrial discharges.

Progress to date indicates that the Clean Water Act has been very effective in reducing industrial discharges. The trend revealed by these data suggest that existing requirements are effecting continuing improvements and that more controls on industrial discharges are not needed.

Congress should focus its reauthorization efforts on the significant remaining water quality problems. We believe that additional regulatory controls on industrial point source discharges at this time would produce little if any significant environmental benefit.

WE ARE COED TO A PROCESS OF CONTINUOUS IMPROVEMENT IN SURFACE WATER AND GROUNDWATER QUALITY.

Union Carbide is committed to a process of continuous improvement in environmental performance. Living up to Union Carbide's corporate value of safety and environmental excellence, and working with the Chemical Manufacturers Association to

implement its Responsible Care® initiative, remain top priorities involving costs and commitments that must be factored into all plans and strategies.

Safety and environmental excellence is one of the company's five core values. A comprehensive and efficient management system embodying the traditional management principles of planning, organizing, leading and controlling assures the success of this corporate value. This management system includes plans or standards for surface water and ground water which have as a basic requirement "*Programs must exist and provide reasonable assurance that Union Carbide locations do not have an adverse effect on space waters and ground water.*"

The management systems control element is an independent environmental audit function headed by a Corporate Vice President who reports directly to the Chief Executive Officer. Over the past six years, over 1000 environmental, health, safety and product responsibility audits have been conducted in more than 500 facilities in 31 countries. Historical performance is quantified and monitored, and results are analyzed and reported periodically to top management and the Health, Safety and Environmental Affairs Committee of the Board of Directors of the Corporation.

We are committed to a process of continuous improvement of environmental performance including surface water and ground water issues which are systematically evaluated and monitored. Corrective action plans are prepared for identified deficiencies and the plans are tracked and implementation assured. Subsequent audits confirm the implementation of the plans and assure the deficiency is corrected.

II. THE STATE OF THE NATION'S WATER

THE EXISTING CLEAN WATER ACT HAS SUCCEEDED IN IMPROVING WATER QUALITY. RECENT AND IMMINENT REGULATIONS PROMULGATED UNDER THE EXISTING ACT WILL REQUIRE FURTHER REDUCTIONS IN POINT SOURCE DISCHARGES. ADDITIONAL CONTROLS ON POINT SOURCE DISCHARGES ARE NOT WARRANTED.

The Kanawha River in West Virginia was once considered one of the most polluted rivers in the nation. The lower Kanawha River Basin receives discharges from municipalities, organic chemical, and pesticide manufacturing plants. Union Carbide process wastewater is treated and discharged from two outfalls on the Kanawha River.

The Clean Water Act instituted the NPDES permit program. In the 1970's and early 1980's the industrial permits were written on the basis of best professional judgment, since comprehensive effluent guidelines were unavailable. Industries and municipalities have steadily upgraded their treatment systems to meet these NPDES permit requirements.

The NPDES program has greatly benefited the Kanawha River. In 1985, The West Virginia Department of Natural Resources (DNR) and the United States Department of Agriculture issued a "Comprehensive Survey of the Lower Kanawha River Basin" which noted "a significant decline in organic pollution in the Kanawha River," and cited DNR fishery population studies that showed "both increased fish species diversity as well as greater total populations". The study concluded that "the existing toxic waste control system appears to be adequate at this time."

Although the Kanawha is greatly improved, regulations required by the existing Clean Water Act will require further reductions in discharges. In 1987, effluent guidelines for the Organic Chemicals, Plastics, and Synthetic Fibers (OCPSF) Point Source Category were promulgated, and pesticides effluent guidelines will be promulgated in the near future. The OCPSF and pesticide guidelines will result in further reductions of toxic chemicals discharges. No further legislation restricting point source discharges of toxic pollutants is warranted at present. Until we observe the effects of implementing this next range of regulations. We need to assess our priorities on a risk/rational basis using a full multimedia/societal assessment.

Union Carbide also discharges treated process wastewater to the Mississippi River. As shown in the Louisiana Chemical Association's 1990-1991 "Chemical Industry Emissions Report," discharges of SARA 313 organic chemicals declined by over 50% from 1987 to 1991.

III. HOW THE ACT HAS WORKED AND NOT WORKED

EFFLUENT GUIDELINES AND WATER QUALITY STANDARDS HAVE ACHIEVED SUBSTANTIAL REDUCTIONS

As indicated above, in 1987, EPA promulgated technology-based effluent limitations for the organic chemicals, plastics and synthetic fibers industrial point source

category (OCPSF—40 C.F.R. Part 414). These include discharge limits for conventional and non conventional pollutants, Best Available Technology (BAT) limits for more than 60 individual toxic pollutants for direct dischargers, and BAT equivalent limits for more than 40 toxic pollutants for indirect dischargers.

The impact of these standards on total releases to surface waters has been clearly demonstrated by data reported under EPA's Toxic Release Inventory. According to the TRI data, member companies of the Chemical Manufacturers Association reduced their direct discharges to surface waters by 77 percent between 1987 and 1991. Indirect discharges to publicly owned treatment works were reduced by 31 percent during this same period.

Additional reductions in surface water discharges are also occurring as a result of discharge limits based on water quality standards. These standards are established to protect aquatic life and human health and are incorporated into permit limits where needed to meet the designated Uses of waters. These water quality-based requirements are typically more stringent than the technology-based requirements and are playing an increasingly important role in driving discharges even further down.

The development of discharge limits based on both technology-based and water quality-based requirements is an evolutionary, ongoing process that will continue without any further action from Congress. Under the Act, EPA must review and revise as appropriate existing effluent limitations. EPA must also review new industries to determine the appropriateness of national limitations. In addition to water quality standards protective of aquatic life and human health, EPA is currently developing additional criteria for protection of wildlife, ecosystems and sediment quality. Added to these requirements are tools to protect the aquatic environment from adverse effect and to address the impacts of complex effluents. These tools include bioconcentration evaluations, biomonitoring requirements and where necessary numerical toxicity limits in NPDES permits. Further, there are a multitude of new programs authorized by the 1987 amendments to the Act (including new stormwater permitting requirements, new requirements to address the problems of toxic hot-spots, new pretreatment requirements and additional enforcement authority) as well as new requirements from legislation that was enacted after the 1987 amendments. These include the Great Lakes Critical Programs Act of 1990, the Coastal Zone Management Act Amendments of 1990 and the Oil Pollution Act of 1990. Implementation of some of these programs has just begun; implementation of others is underway. The full impact of all the programs added in either the 1987 amendments to the Act or in these other statutes, therefore, cannot be fully assessed. There's no question, however, that they will work to reduce industrial discharges still further.

THE ACT LACKS SUFFICIENT FLEXIBILITY TO TAKE INTO ACCOUNT MULTI-MEDIA RISK REDUCTION.

Both the goals of clean water and multi-media risk reduction can be achieved with more flexibility in the Act, in the associated regulations, and in application of regulations. Such flexibility may need to be legislatively directed, because variances such as the those based on Fundamentally Different Factors (FDF) are seldom obtainable and require extraordinary amounts of time and effort.

One example of this need is described in Appendix A for Union Carbide's petrochemical plant in Seadrift, Texas. Its large pond-type wastewater treatment system reduces toxic discharges well below OCPSF effluent guidelines. Concurrently, it removes nitrogen and phosphorous nutrients, produces no sludge, has negligible air stripping (secondary emissions) of volatile organics, and involves little added energy or chemicals. The dispersed algae in the effluent have been demonstrated to be beneficial to the particular receiving water. However, the same algae cause the OCPSF total suspended solids limit to be exceeded and the plant may be forced to construct a high-rate activated-sludge system to handle the algae.

A high-rate activated sludge system at Seadrift would be less effective in toxics reduction, would produce sludge to be landfilled, would air strip volatile organics, and would not remove nitrogen and phosphorous. In addition, such a system would be subject to upset due to flow and organic surges, and use more energy with its associated pollutants. Furthermore, tens of millions of dollars in capital and operating costs are diverted from projects which would make the plant sustainably competitive. Investment in new or retrofitted chemical facilities would result in increased reliance on source reduction and other pollution prevention techniques. More flexibility in dealing with certain requirements, like effluent suspended solids, is needed when an alternative is shown to provide a greater degree of risk reduction and environmental benefit.

A second example is at Union Carbide's petrochemical plant in Taft, Louisiana. As described in Appendix B, this situation illustrates that exercising available, but rarely used, flexibility could lead to a good at-source waste reduction solution which benefits both the environment and industry. However, the situation also shows that if the specific OCPSF Guidelines are inflexibly applied, then a poor end-of-pipe solution could be necessitated, which would have limited benefit. Contrary to popular perception, this source reduction option is the more costly approach in terms of up-front cost, however, it has a 3 to 6 year payback. Again, more flexibility to allow facilities to achieve greater net risk reduction on a multimedia basis is needed.

PHYSICAL ALTERATION OF AQUATIC HABITAT HIGHER THAN CHEMICAL ALTERATION AS A REMAINING RISK BUT HAS RECEIVED LITTLE ATTENTION TO DATE.

The above issue is a quote from the consensus *Report from the Forum of Scientists: Reauthorization of the Clean Water Act*, April 1991; the Forum was convened by EPA's Office of Water and attended by its Assistant Administrator. This particular finding confirmed a similar conclusion of an EPA's Science Advisory Board study resulting in the bench-mark report *Reducing Risk: Setting Priorities and Strategies for Environmental Protection*, September 1990.

Physical habitat alterations include reservoirs, dams, channelization, siltation due to land-use practices, and development adjacent to waterways and waterbodies and in wetlands. Water courses cannot be viewed as pipes or tubs, but rather in the context of the adjacent ecosystem that affects it. These adjacent ecosystems need to be protected if the water course is to be in its best condition.

The Clean Water Act must address the highest remaining risks. Physical alteration is one of them. "Strong provisions (for addressing physical alteration) should be included in (any) CWA reauthorization such as the provisions in the original Act and its amendments that have been successful in controlling chemical alterations toward a de minimis level" (April 1991 Forum). Incidentally, as was noted by EPA's Science Advisory Board, the Great Lakes Initiative also seems to address de minimis levels of chemicals much more rigorously than the high risk matter of physical alteration of habitat.

A very recent National Academy of Sciences study concluded that "Chronic industrial and wastewater point sources of toxic chemicals such as chlorinated dioxins, polynuclear aromatic hydrocarbons (PAHs), and solvents have been identified and controlled or are readily subject to control with existing technology." (*Managing Wastewater in Urban Areas*, National Research Council, April 1993).

I was fortunate to participate in all four studies cited above; each was a consensus of 10-40 of the best of the Nation's scientists and engineers that the organizers could muster. My conclusion is that addressing physical alteration of the aquatic habitat should not be deterred by once again focusing on the lower remaining risk from point-source industrial discharges. Such a focus was appropriate in earlier Acts; however, major improvements have been made, considerable progress is ongoing, and the minimal additional risk reduction achieved by further controls on industrial effluent parameters does not justify the tremendous costs. We need to put our resources where the real risks are.

The Clean Water Act's technology-based and water quality-based controls are designed to ensure continual improvements to water quality. As permit limits become increasingly more stringent, however, at some point the question must be asked whether additional controls on already regulated point sources will significantly reduce risks to water quality, and thereby to human health and the environment. Although the goal of the Clean Water Act is zero discharge, requiring all point source dischargers to achieve zero discharge is technically impossible absent closing down all manufacturing operations in the United States. While a laudable goal requiring zero discharge also means aiming at a moving target as analytical techniques constantly improve. Pursuit of zero discharge ignores the profound need to better understand the real risks. It also ignores the principle of diminishing returns, and the need to weigh the costs of additional regulation of industrial point sources against the benefits to the environment.

As Congress looks to reauthorize the Clean Water Act, therefore, it should take a risk-based approach to determining the appropriate focus of CWA reauthorization issues. Adding more controls on industrial point source discharges will produce little if any significant benefit to the environment. Congress should focus its reauthorization efforts instead on the most significant remaining causes of water quality impairment.

THE COMBINED TREATMENT OF DOMESTIC, COMMERCIAL, AND INDUSTRIAL WASTEWATER IS A TECHNICALLY SOUND, COST-EFFECTIVE APPROACH THAT SHOULD NOT BE CURTAILED.

The Domestic Sewage Exclusion (DSE) under RCRA should be preserved and not eliminated by amendment of the CWA. It makes good technical and economic sense to combine industrial, commercial and domestic wastewater for treatment. Advantages of maintaining the DSE include increased treatability, economies of scale, and encouragement of remediation. Existing and imminent regulations under the Clean Water Act which regulate industrial discharges should be allowed to progress. Still pending are:

- Further Effluent Guidelines for OCPSF (40 CFR 414)
- Effluent Guidelines for the Pesticide Industry (40 CFR 455)
- Effluent Guidelines for Waste Treatment (40 CFR 437)
- Effluent Guidelines for Pulp, Paper & Paperboard (40 CFR 430)
- Effluent Guidelines for Pharmaceuticals (40 CFR 439)
- Effluent Guidelines for Transportation Equipment Cleaning (40 CFR 442)
- Effluent Guidelines for Industrial Laundries (40 CFR 441)
- Sludge Regulations (40 CFR 257)

Biological treatment used by most POTW'S is extremely effective for most industrial waste constituents, including most hazardous organic wastes. This is due to continued inoculation of microorganisms in the domestic sewage, abundance of nutrients, and concentrations below inhibitory levels. Constituents which are non-degradable should be regulated by an appropriate pretreatment limit when justified by riskbased considerations, and not on the basis of classification under RCRA. POTW's have a vast array of tools, including EPA's "Fate and Treatability Estimator" (FATE) software to predict the treatability of specific constituents.

There are economies of scale in collection and treatment systems. For example, South Charleston (WV) POTW plant can treat peak domestic sewage flows because of large capacity for industrial wastewater. Typical municipal systems are bypassed during peak flows.

If the DSE were eliminated, one Union Carbide location would need to add additional, redundant treatment systems at a cost probably in the range of \$5-\$40 million for separate treatment of a wastewater stream that originates from the POTW sludge. No net reduction of discharges to the environment would occur due to separate treatment versus combined treatment, and capital needed for other projects would be lost.

The elimination of the DSE would also delay remediation of wastes, which contain hazardous constituents. Groundwater remediation can be significantly delayed if a separate wastewater treatment system must be built and permitted rather than using installed, available POTW capacity to treat contaminated groundwater. Arbitrary requirements for new wastewater treatment construction and permitting delayed a Union Carbide groundwater remedial action for years at one location. Similarly, elimination of the DSE would add unnecessary costs and delays to new production facilities.

Critics of the DSE charge that it allows indiscriminate dumping of hazardous waste into POTW's. This has certainly not been the case in Union Carbide's experience. Two large Union Carbide manufacturing locations which discharge to POTW's are subject to the stringent OCPSF pretreatment standards as well as general pretreatment requirements and local ordinances. Our smaller manufacturing and research locations are subject to local limits, which we have found to be as stringent as the OCPSF pretreatment standards.

The most sensible approach to managing the risks to POTW's from discharges of all wastes—hazardous or non-hazardous—is via the current regulatory program. This program will be enhanced as new effluent guidelines and sludge regulations are implemented. The current program is effective, technically justified, and encourages pollution prevention.

Continued implementation of two ongoing Clean Water Act programs—the effluent guidelines program and the sludge regulations program—will be far more beneficial than an absolute or partial prohibition on hazardous waste treatment in POTW's. Hazardous waste classification does not reflect risk or treatability. For example, a substance, which in its pure form is a U-listed hazardous waste, is often classified as a nonhazardous waste when it is contained in a process waste. Applying additional restrictions to ultra-low hazard "mixture rule/derived-from rule" hazardous wastes adds cost but does not reduce risk.

The pretreatment program's concentration-based limits encourage pollution prevention by at-source reduction. On the other hand, elimination of the domestic

sewage exclusion would require investment in redundant treatment and disposal systems. Union Carbide believes the most sound, long term approach is investment in pollution prevention rather than redundant treatment.

Incidentally, the Clean Air Act is already addressing secondary emissions from industrial wastes sent to sewer systems. These regulations will result in source reduction of some volatile organic compounds and in additional pretreatment of some industrial wastes.

IV. CONCLUSION

In conclusion, we believe that the Clean Water Act has made clear improvements in water quality across the United States. Existing CWA programs have succeeded in making major reductions in pollutant discharges. These programs promise more success in the future.

Any new Clean Water Act legislation should focus on remaining significant causes of water quality impairment. Further, if multi-media pollution prevention is viewed as the most promising environmental strategy of the future, Congress should promote it by making existing command and control statutes like the Clean Water Act more flexible. Without added flexibility, facilities will not always be able to address their most significant remaining risks through pollution prevention practices. Command and control was the basis of the first twenty years of environmental law, but shouldn't be the basis of the next twenty years. Pollution prevention is not a one-size-fits all proposition. Therefore flexibility will be the key to its success.

APPENDIX A

SEADRIFT (TX) PLANT OF UNION CARBIDE CORPORATION

IMPROVED RELATIVE RISK REDUCTION
AS REASON FOR FLEXIBILITY
IN OCPSF EFFLUENT GUIDELINES FOR
TOTAL SUSPENDED SOLIDS

The 400-acre pond system at Union Carbide's Sadrift Plant in Texas as presently constituted reduces more risk than would alternatives. The apparent excess effluent total suspended solids (TSS) should not be deemed an effluent discharge exceedance, as it is a natural byproduct of this more effective system and enhances local ecological systems. It is important to note that both scientifically-based "real" risk reduction and habitat preservation are EPA goals.

Risk Reduction

- Toxics removal by bacteria in this long-retention pond system exceeds that of activated sludge and levels are well below OCPSF effluent guidelines; in addition, nitrogen and phosphorous nutrients are removed by the algae.
- The liquid effluent exhibits no acute or chronic toxicity even at 100% dosage.
- Storm water and organic surges can be accommodated without system perturbation.
- With a multimedia view, no sludges need to be landfilled or incinerated and volatile organics are not air stripped.
- Pollution from production of involved energy, construction materials, and chemicals is virtually nil as little are used.

Effluent Total Suspended Solids

- The bulk (80-85%) of the 100 mg/L TSS are finely dispersed algae.
- The algae show no buildup in petrochemicals based on carbon dating.
- The receiving Victoria Barge Canal benefits from the algae in terms of biodiversity and population of fish and lower forms.
- The algae are consumed by the food chain and do not form sediment, exert a net oxygen demand, or form nuisance surface accumulation.
- The San Antonio Bay into which the Canal flows has shown no deterioration over the roughly 30 years the Plant has operated.
- The Texas Water Commission supports the positive effects of the algal discharge.

Ecology

- The large pond system provides habitat for waterfowl, fish, alligators, snakes, nutria, and micro-invertebrates.
- The biodiversity and productivity of the receiving water is enhanced by the algae in the pond effluent.

APPENDIX B**REGULATORY FLEXIBILITY AND THE BENEFITS OF
AT-SOURCE WASTE REDUCTION VS. END-OF-PIPE
TREATMENT****UNION CARBIDE'S TAFT, LA PLANT**

The following case study will show that exercising available flexibility can lead to a better solution than that mandated by current media-specific regulations; that the result is a "win-win" situation for both the environment and for industry.

DEFINITION OF ISSUE

Regulatory inflexibility in water-specific regulations may force Union Carbide to use "end-of-pipe" technology to meet the OCPSF Effluent Guidelines at its Taft, La. plant in lieu of using at-source waste reduction technology.

These alternative at-source reduction projects would not only provide a return on investment over time and reduce overall waste to all media, but would recover valuable products and reduce the need for non-renewable raw materials (petroleum feed stocks).

ABOUT THE PLANT

The Union Carbide Taft Plant is near Hahnville, Louisiana, which is approximately 30 miles up the Mississippi River from New Orleans. It employs 1200 full time and 200 contract employees with an annual payroll of \$67 million. It is the largest tax payer in St. Charles Parish (County in La).

The Taft Plant is a large integrated manufacturing facility shipping three billion pounds per year of olefins (ethylene and propylene) and olefin derivatives (ethylene oxide, ethylene amines, acrolein/acrylics, and peracetic/peracetic acids). The basic chemicals manufactured at the Taft plant are used to produce many common consumer items such as: polyethylene plastic garbage bags, brake fluids, acrylic paints, antifreeze, polyester films and fabrics,

shampoos, detergents, perfumes, pharmaceuticals, animal feed supplements, and others.

ISSUE BACKGROUND

The Taft Plant is in the Organic Chemical, Plastics and Synthetic Fiber (OCPSF) Effluent Guideline Category in the 2869 Standard Industrial Code classification. Taft's NPDES Permit expired in October, 1992, and is currently operating under the limitations of that permit, having submitted an application for renewal six months prior to expiration. Re-issuance of the permit is anticipated in mid to late 1993.

The current Wastewater Treatment Facility (WWTF) is an activated sludge system providing secondary treatment. It is extremely efficient and exceeds 99% soluble organic removal efficiency.

This current system not only meets the "toxics" limitations at current permitted levels, but for future OCPSF Effluent Guideline levels for toxics as well. However, it does not meet the OCPSF Effluent Guidelines for Total Suspended Solids (TSS) and the associated Biochemical Oxygen Demand (BOD) exerted largely by the TSS.

SOLUTION

With an end-of-pipe mind set in order to comply with water regulations, five years and \$2.5 million of Research and Development (R&D) and piloting work were expended to find a system which will meet Effluent Guidelines. The work concentrated on TSS/BOD removal and examined and piloted a variety of systems including filtration, filtration with polymer addition, carbon adsorption, pre-treatment, system re-configuration, and upgrading of secondary clarifiers. The solution was found to be an additional activated sludge polishing system with a preliminary estimated cost of \$7.5 million in 1992 dollars. This does not include ongoing operating costs. Assuming a 12% discount rate, the project has a Net Present Value (NPV) of a negative \$7.1 million dollars, which does include operating costs. This was "money down the drain". Even if this money were spent, the net impact on the environment would have been zero. It would have shifted the reductions in discharge of non-hazardous suspended solids from water to a corresponding increase in discharge to land.

After project definition, Union Carbide recognized that more "end-of-pipe" treatment was not only very costly, but was clearly not the most desirable solution.

A team was formed to explore "at-source solutions". The results showed that there is an "at-source" solution, but with qualifiers. The solution is depicted in the attached Figure. The qualifiers are:

- a) it is more expensive in terms of initial investment (about \$16.3 million).
- b) based on bench-scale testing, OCPSF Effluent Guidelines limitations for biological oxygen demand and total suspended solids will be approached but may not be completely met all the time.
- c) the solution results in a net gain for the environment.

The cost qualifier is not a major obstacle because this "at-source" solution has a 3-6 year paypack. This is due primarily to the recovery of product, but also reflects some reductions in WWTF operating costs associated with the decreased waste load.

The advantages of the at-source solution are many and include:

POLLUTION PREVENTION ADVANTAGES	DESCRIPTIVE
a) Avoidance of "end-of-pipe" investment	Once you build it, you must feed it: Creating additional infrastructure that can be used over time increases reliance on this fixed capital investment. These dollars have also been removed from consideration for other projects.
b) Reduced secondary sludge generation and subsequent land disposal	A net decrease of ~4,000 lb/day with at-source waste reduction versus "no net change" with end-of-pipe treatment.
c) Reduced secondary emissions	Less influent loading means less secondary emissions from the WWTF.
d) Product recovery	Up to 40 thousand pounds per day of products, such as ethylene glycol and acrylic acid.
e) Reduced use of raw materials used as feed stocks	Each pound of recovered product results in an equivalent reduction in need for the "up-front" raw material feed stock.
f) Influent organic load reduction	WWTF runs better and uses less energy.

The second qualifier of "not completely meeting Effluent Guidelines all the time" is the major obstacle. Union Carbide cannot afford to spend dollars on "at-source" waste reduction projects where risk exists that the resulting system may be incapable of operating in full compliance with applicable regulations. This clearly points to the need for greater flexibility in the development of legislation and administration of ensuing regulations.

In this case, because the Effluent Guidelines are "brightline" values that must be met, there is little allowance for Best Professional Judgment (BPJ) by a permit writer. This effectively prohibits alternative solutions such as at-source waste reduction.

The obvious extrapolation is to increase the number of projects in the "at-source" solution. However, there is an optimum point in the at-source/end-of-pipe trade-off beyond which solutions become impossible economically.

In this example there is flexibility available in the form of a Fundamentally Different Factors (FDF) variance. Approval of a FDF variance by the EPA can facilitate the use of a Best Practicable Judgment (BPJ) permit. Union Carbide has applied for an FDF variance for the Taft WWTF. However, this flexibility has not been exercised to-date by the EPA. As of December 31, 1992 a total of 249 FDF applications has been submitted to the EPA. Of that total, 156 were denied or withdrawn. Of the remaining 93, 86 are still pending. Of the 7 which have been approved only 1 was for an OCPSF discharger and it was only for partial relief on one OCPSF parameter while all other OCPSF parameters remained in force. Some FDF application withdrawals (such as 9 in 1992 dealing with OCPSF cyanide limits) were due to changes in the regulations made by EPA which eliminated the need for variances. The overall situation is that the FDF variance has been practically impossible to obtain. Such inflexibility effectively eliminates alternative solutions, as illustrated by Union Carbide's examples provided in this testimony, to environmental protection which are better for both environment and industry." Exercising this flexibility will facilitate the implementation of the "at-source" waste reduction solution at Taft.

Flexibility should be construed as the latitude to seek an optimum solution which best meets the requirements of sound technology, viable economics, and environmental protection. Technical, economic, and regulatory constraints must all be considered simultaneously to arrive at a workable solution. Without flexibility, this optimization process cannot occur and poor, or less-than-optimum, solutions, as illustrated by this example, will result.

SUMMARY

Union Carbide strongly urges the greater use of statutory/regulatory flexibility. The Taft Plant example illustrates that regulatory inflexibility can be an obstacle to "doing the right thing". It can lead easily to a less desirable solution. Greater future flexibility and exercising of existing flexibility can be directed to accomplish positive results which benefit the environment and industry at the same time.

Senator Bob Graham
Committee on Environment and Public Works
United States Senate
505 Hart Senate Office Building
Washington DC 20510-6175

Dear Senator Graham:

In response to your letter of October 12, I have prepared the attached answers to the four questions you posed as follow-up to my testimony on June 16 concerning reauthorization of the Clean Water Act.

Thank you for the opportunity to contribute again to this important matter.

Very truly yours,

A handwritten signature in cursive script that reads "Richard A. Conway".

CLEAN WATER ACT REAUTHORIZATION

Comments by Richard A. Conway in
Response to Questions Posed by Senator Bob Graham, 12 October 1993

1. For any additional chemicals to be regulated, the proposed requirements should be subject to peer review by qualified scientists and be subject to public comment.

I base my peer-review comments on ten years of experience on EPA's Science Advisory Board, as well as seven years on National Research Council committees, boards, and commissions.

The persons who develop any scientific document, such as a risk analysis for a specific chemical or class of chemicals under consideration for regulatory action, do so based on the specific data of which they are aware as interpreted according to their protocol and value system. Several flaws are apparent: 1) they likely are not aware of all the data in existence, 2) the validity of the protocol selected and value system used for interpretation usually diminishes as the number of people involved becomes small, and 3) the developers of the document have a stake in the outcome so are prone to overlook errors in their zeal to publish. If proper peer review is not practiced, inevitably less than best starting data bases are used, interpretation procedures are not fine tuned, and/or outright errors creep into scientific documents.

There are numerous instances in current environmental statutes where lists used for regulatory programs have never been subject to appropriate peer review. The SARA Section 313 list of chemicals, which continues to be used for purposes beyond the original intent of public emissions reporting, was derived from a series of state lists which themselves had not been reviewed. In fact, the Clean Water Act priority pollutants list has never been peer reviewed.

An adequate peer review procedure has the following elements which were developed through long experience by the National Academy of Sciences complex ("Report Review: Guidelines for Committees and Staff," NAS-NAE-IOM-NRC, July, 1989).

- Selection of a set of reviewers by a body other than the authors, based on scientific qualifications and coverage of key elements of the subject material.
- Collection of comments from the reviewers.

- A documented response (to the comments) by the writers of the subject material.
- A documented evaluation (of the response) by qualified "non-stakeholders." (Note: A "stakeholder" is any person who is affected by the subject material or even cares if it is issued or not. If the reviewers' comments were not adequately addressed by the original authors, i.e., if either all changes were not made or valid technical arguments were not presented that certain changes were inappropriate, the non-stakeholders make the final decisions on such unresolved points.)

The best scientific basis for regulating or not regulating the material thus can be assured using these peer review procedures. All then will be done to avoid both over-regulation with associated economic threats and under regulation with environmental threats. Regulating more chemicals through incorporation of lists from other sources that have not received adequate peer review is a particular problem to be avoided in new legislation.

Finally, since there are aspects of regulating given chemicals or chemical classes that are not based on science, an opportunity for public comment should be provided. The reauthorization of the CWA should include a provision that proposed regulation of any chemical undergo scientific peer review and be subject to public comment.

2. Progress has been made in establishing direct links between agricultural practices and water quality of streams and waters.

Up to about 1989, the matter of direct links between what happened in the farmer's field and diminished quality of streams in associated drainage areas was controversial, much like tobacco smoke and lung cancer were at one time. Much investigation in this area has taken place over the past four years, in part due to progressive efforts by the Department of Agriculture. Agriculture took the lead in the President's Water Quality Initiative. One example is the establishment of connections between ground water and rivers that resulted in pollution of streams by degraded atrazine; this was determined in a mid-west initiative done cooperatively by USDA, EPA, and others. An expert on this topic is Dr. Suresh Rao of the University of Florida (904/392-2302).

As I advised in my testimony, the Senate should avoid the trap of viewing water courses as a conduit subject to only chemical contamination problems. Of at least equal importance is their ecological condition. Sedimentation is one major

problem directly linked to agricultural practices; stream-bed ecology can be largely wiped out this way. The Nature Conservancy finds that sedimentation is the major threat to a nature preserve, Big Darby Creek in Ohio, and is developing programs to plant high-quality hay along the borders of farmers' fields adjacent to the Creek to prevent erosion. Banks of streams with their essential ecological niches also can be rendered barren by livestock and/or agricultural development without adequate buffer zones. I understand that Bill Cooper, another hearing witness, plans to address this question in more detail.

3. Pollution prevention programs can be constructed so that they have a measurable and protective effect on water quality parameters of significant risk.

I strongly agree that pollution prevention is not an end in itself. The principal objective should be risk reduction, and pollution prevention is an important tool to reducing risk. The value of pollution prevention should be assessed on the basis of multi-media risk reduction. It is appropriate that multi-media pollution prevention should not compromise our water quality goals. It is important to note that decreasing releases to air and land improve surface water quality due to less atmospheric deposition, surface runoff, and groundwater /surface water interactions. Thus such efforts should not necessarily be viewed as a net negative for water quality.

Some options that would specifically and measurably relate pollution prevention efforts with water quality are:

- As documented in my written submittal to the 12 June hearing (excerpt attached) pollution prevention projects exist that can reduce much more significant risks via air and land media with insignificant increases in risk to surface water. The permit writers should be empowered with sufficient flexibility to make such evaluations and implement alternative compliance strategies.
- When alternative measures bring multi-media improvements, but don't quite meet BAT standards, consideration should be given to still meeting water quality criteria or standards.
- Where water quality standards are not quite met by the source implementing multi-media programs, attainment of water quality standards could be achieved through the watershed management process in Title III of S. 1114. It may be far more cost-effective to make up the

difference from elsewhere in the watershed, recognizing that the facility's reductions in other media will still be of some benefit to water quality.

- It may be desirable in some cases to allow pollutant reductions achieved by other dischargers in a watershed to supplement an alternative compliance strategy of a facility that is pursuing a multi-media pollution prevention project, as long as overall water quality benefits are achieved. More information on the relative water quality impacts of different pollutants is needed to enable watershed management entities to evaluate the overall net water quality impact of different pollution reduction scenarios and water quality impacts caused by different substances in a watershed.
- Implementation of BAT could be deferred if a planned pollution-prevention project to be completed within two to three years would reduce effluent quality below the predicted BAT level.

In addition, voluntary pollution prevention efforts can often begin earlier in areas where water quality based permits have not been issued. Early reductions, though not necessarily equivalent with a water quality standards, can have a cumulatively beneficial effect. Incidentally, in addition to usually having a measurable effect on reducing risk to human health and ecological systems, pollution prevention has several other benefits. Regulatory compliance aside, reduction of pollution generation prevents release of unregulated material not now thought to present health/ecological problems but could be later so identified; pollution prevention also reduces consumption of non-renewable resources, enhances the aesthetic quality of life by not generating waste that are nuisances, and increases the environmental ethic of workers involved.

The above elements should be considered when a pollution prevention and non-pollution prevention solution are being weighed and the regulatory results are close. Considering the safety margins or uncertainty factors of 100 to 1000 percent imbedded in regulatory limits, I would define "close" as within a safety factor of no less than 70 percent for conventional pollutants with a larger, as their embedded safety factor is much larger.

4. Best management practices need to be developed, implemented, and enforced for agriculture and silviculture as BAT has been for industry.

Reauthorization of the Clean Water Act should address the remaining higher-risk areas like non-point-source pollution. "Teeth" should be put into the

①

Act to enforce states to develop, adopt, and implement best management practices (BMP) for agriculture and silviculture. Funds to do this could be provided to the states; a default could be that USDA/EPA would do it if states do not. BMP should be developed in conjunction with that state's appropriate academic institutions and be reviewed by the affected regulated community for economic feasibility. The environmental risks being addressed should be ranked high, medium, and low and a targeted priority established.

TESTIMONY OF JAMES R. KARR, DIRECTOR, INSTITUTE FOR ENVIRONMENTAL STUDIES, UNIVERSITY OF WASHINGTON

Thank you, Mr. Chairman, for inviting me to appear before this committee to comment on the chemical, physical, and biological health of the waters in the United States and whether and to what extent the Clean Water Act has achieved its goals.

OVERVIEW

Societal perceptions of water resources have evolved rapidly in the past decade thanks to the widespread recognition that humans depend on fresh water and the resources associated with fresh water. Abundant evidence indicates that the quality of water resources is being degraded and the supply of fresh water is being depleted. **DEGRADATION CONTINUES BECAUSE WE HAVE IMPLEMENTED THE CWA AS IF CRYSTAL CLEAR DISTILLED WATER RUNNING DOWN CONCRETE CONDUITS WERE THE GOAL OF THE ACT.**

The gap between the mandate and accomplishments of the CWA widens despite accomplishments such as reduction in the volume of chemical contaminants released to water bodies. The gap widens because a narrow perspective has dominated implementation of the CWA. We waste money and degrade resources because decisions based on chemical criteria do not protect the condition of the resource; priority lists of chemicals do not accurately reflect ecological risks; and point-source approaches do not effectively control the influence of nonpoint sources or the cumulative effects of numerous contaminants. Finally, the chemical contaminant approach fails to diagnose water resource problems caused by other human influences.

We can be proud of our success in regulating contamination from some point sources, but we should not allow those accomplishments to permit us to overlook continuing degradation in resource condition. Rather, we should focus our energies to protect water resources from all forms of degradation.

Continuing degradation of aquatic systems is obvious, even to the untrained eye, because government agencies have been weak, inappropriately focused, and therefore largely ineffective at reversing resource declines. Underfunding—the chronic complaint from all bureaucracies and scientists—is not, however, the most important problem. The most important problem is that we do not see water resources as integrated and complex natural resource systems. Failure to adopt such an integrative perspective in reauthorizing the CWA is unacceptable on legal, scientific, economic, and ethical grounds.

THE CWA MANDATE

Although the mandate of the Clean Water Act was to “restore and maintain the physical, chemical, and biological integrity of the nation’s waters,” its implementation has concentrated on two issues: effectiveness of wastewater treatment technology to control point sources of pollution and human cancer risk. The dominance of these two issues has prevented program managers, political leaders, and the public at large from tracking the actual condition of the resources. Growing recognition of the downward trend is stimulating many to call for change in the vision and mandate of the CWA. In drafting a solution, we must keep in mind the admonition from Albert Einstein that goes something like: **“YOU CANNOT SOLVE A PROBLEM BY APPLYING THE CONCEPTUAL FRAMEWORK THAT CREATED IT.”** We need a new conceptual framework to protect our water resources.

Volumes can and no doubt will be written to convey the details of change that should be considered. To shift the conceptual framework, as called for by Einstein, we need to **SHIFT THE SOCIETAL FOCUS FROM WATER QUALITY TO A BROADER CONCEPT: THE ECOLOGICAL HEALTH OF THE WATER RESOURCE SYSTEM.**

Another shift will have to come in our use of the word pollution. We waste large sums of money, and degrade water resources, because of our narrow conceptual focus on chemical contamination and its prevention. In conventional usage and in the technical jargon that permeates the CWA and its implementing regulations, pollution is usually assumed to mean chemical contamination. But human influences on water resources are broader than chemical contamination. A more appropriate definition, present in the 1987 CWA but little used, states that pollution is any “[hu]manmade or [hu]man-induced alteration of the physical, chemical, biological, or radiological integrity of water.” Under this definition, humans may degrade or pollute by withdrawing water for irrigation, by overharvesting fish populations, or by introducing exotic species or chemical contaminants. Just as one needs to assess risks carefully to protect human health, one needs to assess risks carefully in formulating policies to protect the ecological health of water resource systems. Such

risk assessment requires a framework broader than control of toxics, or even chemical contamination—a framework that goes beyond faith in chemical criteria and technological solutions to address all these influences.

WATER RESOURCE TRENDS

Using chemical criteria, USEPA acknowledges that water resources throughout the United States are significantly degraded. In 1990, the states reported to USEPA that 998 water bodies had fish advisories in effect, and 50 water bodies had fishing bans imposed. More than one-third of river miles assessed do not fully support designated uses as defined under the CWA. More than half of assessed lakes, 98% of the assessed Great Lakes shore miles, and 44% of assessed estuary area did not fully support designated uses. To make matters worse, EPA UNDERESTIMATES THE MAGNITUDE OF THE PROBLEM BECAUSE ITS ANALYSES ARE BASED ON CHEMICAL RATHER THAN BIOLOGICAL CRITERIA.

Under section 305(b) of the CWA, states are required to report the status of water resources within their boundaries. In one state, the proportion of the state's waters assessed as degraded doubled as a result of the more comprehensive, sensitive, and objective assessment provided by using biological criteria. IN OTHER WORDS, WHEN THOSE STATUS REPORTS INCLUDE BIOLOGICAL EVALUATIONS, THEY SHOW THAT CONVENTIONAL CHEMICAL CRITERIA FAILED TO DETECT 50% OF THE IMPAIRMENT OF SURFACE WATERS.

That conclusion is reinforced when one examines the biota of America's fresh waters. Aquatic organisms are seriously threatened. Only 11 to 14% of North American terrestrial vertebrates (birds, mammals, and reptiles) are classed as rare to extinct, but from 34 to 73% of major aquatic taxa are classed as rare to extinct. One-third of the native fishes of the Colorado River are endangered, threatened, or extinct. Twenty percent of the mussels and their relatives of the Tennessee River have been lost, and 45% of the remaining species are endangered or seriously depleted.

Sport and commercial fisheries of the United States have also been decimated by human actions during this century. Since 1910, wild salmon runs on the Columbia River have declined by more than 96%. The Illinois River (Illinois), second in commercial catch to the Columbia early in this century, declined to a near zero commercial catch over a decade ago. Commercial fish harvests in the Missouri and Delaware rivers have declined by more than 80% this century. How would we respond as a society if our agricultural productivity declined by more than 80%? How can we continue to ignore declines of that magnitude in water resources, which are just as essential to the economic and ecological health of human society?

On top of the loss of species and the massive decline in commercial and sport harvest, consumption of what fish remains often threatens the health of humans. Fish consumption advisories, sport fishing restrictions, or sport fishing closures occur in more than 40 states each year, and women who consume contaminated fish bear children with significant mental impairment, which persists at least to age 4. This intergenerational effect is now emerging as a hidden, and previously unsuspected, cost of the status quo.

THESE AND OTHER EXAMPLES OF DEGRADATION OF WATER RESOURCE SYSTEMS DEMONSTRATE THAT OUR DEPENDENCE ON TECHNOLOGY-BASED STANDARDS AND CHEMICAL CRITERIA TO PROTECT THE QUALITY OF OUR WATER RESOURCES HAS FAILED.

WHERE DO WE GO FROM HERE?

The technology-based approaches of the past 20 years concentrated on a narrow range of human actions while equally serious threats were ignored. But humans degrade streams and other water bodies in one or more of five major ways (Table 1). Efforts to protect the quality of water resources are doomed unless they explicitly incorporate this range of factors into a comprehensive planning and assessment process.

Table 1.—Degradations in Resource Characteristics Typical of Problems in Northwest Watersheds

Factor	Typical degradation in northwest watersheds
Food (energy) source	Altered supply of organic material from riparian corridor. Reduced or unavailable nutrients from the carcasses of adult salmon after spawning.
Water quality	Increased temperatures. Oxygen depletion. Chemical contaminants.
Habitat structure	Sedimentation and loss of spawning gravel. Obstructions that interfere with movement of adult or juvenile salmonids. Lack of coarse woody debris. Destruction of riparian vegetation and overhanging banks. Lack of deep pools. Altered abundance and distribution of constrained and unconstrained channel reaches.
Flow regime	Altered flows that limit survival rates during any phase of the salmon life cycle.
Biotic interactions	Increased predation on young by native or exotic species. Overharvest by sport or commercial fishers.

Two important advances in the past decade are key to protection of water resources: (1) development of a broader conceptual perspective to protect the health of the entire resource system from an array of human influences, not only chemical contamination, and (2) use of biological monitoring and biocriteria to protect the quality of water resources. Biocriteria provide cost effective and sensitive tracking of resource condition. Biological monitoring is especially critical because impairment of waters is predominantly caused by nontoxic and nonchemical factors. Additional strengths of biological monitoring include the ability to assess and characterize resource status; diagnose and identify chemical, physical, and biological impacts as well as their cumulative effect; serve a broad range of environmental and regulatory programs when integrated with chemical and toxicity assessments; and provide a cost-effective approach to resource protection. Ambient biological monitoring is less likely to under protect the water resource than the current chemical approach. Finally, ample evidence exists to show that chemical approaches can waste economic and environmental resources.

IMPEDIMENTS TO BIOLOGICAL MONITORING HAVE BEEN LARGELY OVERCOME

Recent studies by state and federal agencies and by university-based scientists have shown that the classic arguments against biological monitoring carry little weight relative to the resource protection benefits that result. Recent studies show that biological monitoring is cost-effective, broadly based ecologically, flexible for special needs, sensitive to a broad range of degradation, and easy to explain to the general public. Moreover, biological monitoring provides direct and meaningful evaluations of resource condition because it integrates cumulative effects, such as point and nonpoint pollution, habitat degradation, and flow alteration.

Technological or engineering approaches typically deny or ignore common signs of biological impairment, a problem that biological monitoring overcomes. Limited legal and regulatory programs foster dependence on technology-based controls of pollution and dominance of a narrow chemical-contaminant definition of pollution.

Ever-expanding human influences on water resources produce a shifting array of problems. Biological monitoring increases the likelihood that unanticipated problems will be detected earlier rather than later. Criteria developed for many chemi-

cal contaminants were (now obviously incorrectly) applied uniformly for all water resources, and the lack of uniformity in biological expectations was considered a weakness. We now recognize that lack of uniformity reflects the true water resource situation. In retrospect, the idea that the same criteria should apply to all waters is ludicrous.

CHANGING THE CLEAN WATER ACT

1. THE PHRASE WATER QUALITY WITH A BROADER CONCEPT, SUCH AS PROTECTING THE ECOLOGICAL HEALTH OF THE WATER RESOURCE SYSTEM. Society no longer tolerates dilution as the solution to pollution. That approach has compromised resource quality on too many miles of rivers and acres of surface water. Not only should we see water resources in this broader context, we should see human influences on water in a broader context. Humans degrade water resources in numerous ways, and we must become more effective at distinguishing degradation by humans from variation caused by natural events. Efforts to protect resources, or to halt and even reverse degradation, are unlikely to succeed without careful analysis of the nature and consequences of diverse local and regional impacts.

2. AMBIENT BIOLOGICAL MONITORING CENTRAL TO ASSESSING THE QUALITY OF THE NATION'S WATER RESOURCES. Ambient biological monitoring involves examining the biota (fish, invertebrates, plants, and so on) of a water body. The species composition, relative abundance, and health of individual organisms measure local biological conditions and, thus, human-induced degradation of streams, lakes, and estuaries. Biological monitoring is an essential supplement to chemical monitoring because it provides a more direct and accurate evaluation of resource condition. All environmental legislation is grounded in biology—not chemistry, physics or mathematics. The objective of ecological health is a biological objective, and, thus, biological evaluations are critical to all water resource assessments.

3. EVALUATE THE ACTUAL RESULTS OF MANAGEMENT AND PROTECTION PROGRAMS. We remain blissfully ignorant of the actual benefits and costs of regulatory actions ostensibly designed to protect water quality but with unknown influence on the health of water resources. For decades, we have operated water quality programs as if the relationships between societal action and resource condition were known. In fact, our policies are untested hypotheses that continue to permit resource degradation. We can—indeed should—use management programs as experiments to test our hypotheses about system responses to human actions. Only then can we modify management programs to benefit society, both economically and environmentally.

SUMMARY

Reduction in ecological risk should be a central component of the reauthorization of the Clean Water Act because healthy ecological systems are the foundation of a healthy economy and society. To protect ecological health, we should focus decisions in ways that will protect the inherent potential of natural systems—potential that includes their capacity for self-repair and requires little management intervention.

SOCIETY WOULD NOT TOLERATE AN APPROACH THAT DEFINED THE MEDICAL TECHNOLOGY TO BE USED RATHER THAN AN APPROPRIATE HUMAN HEALTH ENDPOINT. THE TIME IS RIPE FOR USING THE SAME WISDOM TO EXPLICITLY DEFINE AND PROTECT BIOLOGICAL ENDPOINTS AND THUS PROTECT THE ECOLOGICAL HEALTH OF WATER RESOURCES.

COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS
 WASHINGTON, DC 20510-8175

October 12, 1993

Dr. James Karr
 Institute for Environmental Studies
 Engineering Annex
 FM 12
 University of Washington
 Seattle, Washington 98195

Dear Dr. Karr:

The Subcommittee appreciates your participation in the hearings of the Subcommittee on Clean Water, Fisheries and Wildlife in its review of the Clean Water Act. In furtherance of our review, we have a few follow-up questions for the record. Please provide your answers to Bill Leary at 505 Hart Senate Office Building, Washington, D.C. 20510 by October 29, 1993.

1. Can you expand on your comments about the need for peer review? What has been the affect, if any, of not providing peer review under the Clean Water Act? Could you describe what, in your opinion, would be an appropriate and adequate peer review process and the kind of contribution that it would make?
2. A 1988 Agricultural Department study questioned the current ability to identify a direct link between agricultural "discharge" and the water quality of receiving streams. For example, it says: "Offsite damage associated with water pollution cannot be measured directly and links between farming and affected water uses are not well defined. Many assumptions are made to estimate offsite damage, and both methods and data for estimating damage need to be improved." Bradley M. Crowder, Marc O. Ribaldo, and Edwin Young, "Agriculture and Water Quality," Washington: USDA, August 1988, p. 2.

For example, I understand that in one research study of phosphorus loading and nonpoint source pollution in Estonia, the authors concluded that phosphorus stream loadings from intense agricultural operations are quite low, in spite of the fact that phosphorus loadings are high in the fields. The field-generated phosphorus combines with the sediment to prevent stream damage. whereas phosphorus loadings from industrial and municipal sources are highly interactive. E. Loigu, "Evolution of the Impact of Non-point Source Pollution on the Chemical Composition of Water in Small Streams and Measures for the Enhancement of Water Quality," Advances in Water Pollution Control, H. Laikari, ed., 1989, pp. 213-217.

Have we made any progress in establishing a direct link between what happens in a farmer's field and what occurs to the water quality of streams and waters?

3. In looking at pollution prevention as a toll for improving water quality, it is conceivable that in our zeal for pollution prevention, we can and will identify ways to place controls on the front end without necessarily improving water quality, or being able to document scientifically a relationship between the pollution prevention effort and an improvement in stream quality. What recommendations would you make to this committee about the construction of a pollution prevention program to assure that pollution prevention does not become the end itself, but rather that those pollution prevention efforts undertaken will have a measurable and protective effect on water quality?
4. In your report to EPA, you state that restrictions on agricultural and silvicultural practices should be included in any federal program for nonpoint source pollution control. What restrictions did your team have in mind?

Sincerely,

Bob Graham
Chairman
Subcommittee on Clean Water,
Fisheries and Wildlife

Senator Bob Graham, Chairman
Subcommittee on Clean Water, Fisheries, and Wildlife
Committee on Environment and Public Works
United States Senate
Washington, DC 20510-6175

Dear Senator Graham:

Your letter of several weeks ago asks me to provide answers to follow-up questions for the record on my testimony June 16, 1993. Many of the questions in that letter seem to be directed to others that have appeared before your committee. Thus, I will pass on those questions; however, it seems appropriate for me to address several other issues at this time.

I want to raise concerns about the language used to address protection of the biological components of water resource systems. As you know, a very powerful goal statement was included in the 1972 Clean Water Act (PL 92-500) and that phrase ("restore and maintain the physical, chemical and biological integrity of the Nation's waters") has been maintained in subsequent reauthorizations. The time is ripe to reinforce the message of that phrase throughout the legislation before your committee.

I suggest you adopt language that makes the following issues explicit.

1. *Retain language that explicitly calls for protection of indigenous species.*

Exotic and introduced species threaten valued native populations of fish, shellfish, and other aquatic organisms. If the CWA fails to specify maintenance of indigenous species, we risk the loss of native species. Who would prefer a shift from populations of salmon to carp, for example, a shift that might be defended without explicit language addressing protection of indigenous species as a CWA goal? Why not protect against management allowing intentional or accidental introduction of exotic species such as the zebra mussel, sea lamprey, or purple loosestrife (an invasive weed of wetlands). In many cases, we can demonstrate that the introduction of these exotics has more ominous and long-lasting influences than chemical contaminants on water resources of importance to human society. Finally, virtually all of the leading scientific methods proposed to evaluate biological integrity explicitly recognize exotic species as indicators of water resource degradation.

Even if we could achieve zero discharge of chemical pollution, the quality of our water resources will continue to decline if we ignore other causes of resource degradation. Chemical pollution and toxicants are not the only threat to aquatic resources. Channel modification, flow alteration, and introduction of non-native species all represent important threats to the physical, chemical, and biological integrity of our water resources.

2. *Adopt language that goes beyond the protection of fish, shellfish, and wildlife to protect the entire biota of the nation's waters.*

Although certain taxa have obvious importance to humans because of their value as commodities, those species do not exist in isolation. Often we cannot predict which other organisms are critical to the persistence of commercially valuable (fish or shellfish) or charismatic (wildlife) species. Exclusion of insects, zooplankton, phytoplankton, higher plants, bacteria, and fungi from protection under the act ignores the important contribution of these taxa to the structure and function of an ecologically healthy biotic community, a community that is essential to maintenance of valuable aquatic resources. No matter how important a particular species is to human society, it cannot persist outside the biological context that supports and maintains it.

Reauthorization of the act provides an opportunity to reinforce the importance of these concepts by extending the language to include all major taxa (species). The relative importance of all those groups may shift under different circumstances and in different locations. Finally, we should not presume that we know today which species are important, a fact that is clearly demonstrated by recent recognition of the unexpected value to society of the Pacific yew. Because it is prudent to cast our net widely to protect the interests of future generations, reauthorization language should go beyond "fish, shellfish, and wildlife."

3. *Broaden the language to protect biological integrity in its broadest sense, including not only populations but the structural and functional organization of that biota.*

Water resources are not simply water; their quality and value as resources depend on underlying biological processes. USEPA recognizes that an assessment of species richness, species composition, populations, and trophic composition of the resident biota is "the most direct measure possible of support of a Clean Water Act goal, because maintaining biological integrity is one of the legislative mandates" (USEPA, Feasibility Report on Environmental Indicators). Biological integrity as defined by the EPA does not emphasize certain taxa to the exclusion of others as current language in the CWA does. Biological integrity is defined by the EPA as "the condition of the aquatic community inhabiting unimpaired waterbodies of a specified habitat as measured by community structure and function" (USEPA, 1990. Biological Criteria: National Program Guidance for Surface Waters. EPA-440/5-90-004.) An aquatic community, as defined in the Biological Criteria document just cited, is "an association of interacting populations of aquatic organisms in a given waterbody or habitat". The emphasis is on the interaction and association of species and the structure and function of resident aquatic communities (see pages viii, 5, 13 of that document).

In short, references to the maintenance of populations or abundances should be broadened to refer to structure and function in the biotic community. Many states already assess water resource condition in this broader context, and USEPA encourages this view (see EPA-440/5-90-004 again). Population abundance is a notoriously difficult attribute to measure because of its inherent variability, a fact that was recognized as early as 1919 by the pioneering biologist S. A. Forbes in his papers on degradation in the Illinois River. Thus, the broader view is scientifically defensible. Its explicit inclusion in the CWA reauthorization will ensure adoption of that leading edge approach to resource protection throughout the nation.

Senator Bob Graham

-3-

November 3, 1993

Finally, structural and functional aspects of the biotic community--such as trophic composition, species richness, and species composition--measure higher-order, community-level processes and therefore provide a more meaningful characterization of aquatic resource condition.

Making these three changes explicit will strengthen the Clean Water Act as it improves and clarifies its mandate. These suggestions are based in published EPA documents or in advances in science over the past decade. I hope these hurried comments will prove useful in your deliberations. Please feel free to call on me if I can be of further assistance.

Sincerely,

James R. Karr
Director

103D CONGRESS
1ST SESSION

S. 1114

To amend and reauthorize the Federal Water Pollution Control Act, and
for other purposes.

IN THE SENATE OF THE UNITED STATES

JUNE 15, 1993

Mr. BAUCUS (for himself and Mr. CHAFEE) introduced the following bill;
which was read twice and referred to the Committee on Environment and
Public Works

A BILL

To amend and reauthorize the Federal Water Pollution
Control Act, and for other purposes.

1 *Be it enacted by the Senate and House of Representa-*
2 *tives of the United States of America in Congress assembled,*

3 **SECTION 1. SHORT TITLE; TABLE OF CONTENTS; REF-**
4 **ERENCES.**

5 (a) **SHORT TITLE.**—This Act may be cited as the
6 “Water Pollution Prevention and Control Act of 1993”.

7 (b) **TABLE OF CONTENTS.**—The table of contents of
8 this Act is as follows:

Sec. 1. Short title; table of contents; references.

Sec. 2. Findings and purpose.

TITLE I—WATER PROGRAM FUNDING

- Sec. 101. State revolving loan funds.
- Sec. 102. State program grants.
- Sec. 103. General program authorizations.

TITLE II—TOXIC POLLUTION PREVENTION AND CONTROL

- Sec. 201. Point source technology based controls.
- Sec. 202. Water quality criteria and standards.
- Sec. 203. Toxic pollutant phase-out.
- Sec. 204. Pretreatment program.
- Sec. 205. Pollution prevention planning.

TITLE III—WATERSHED PLANNING AND NONPOINT POLLUTION CONTROL

- Sec. 301. Water quality monitoring.
- Sec. 302. Comprehensive watershed management.
- Sec. 303. Impaired waters identification.
- Sec. 304. Nonpoint pollution control.

TITLE IV—MUNICIPAL POLLUTION CONTROL

- Sec. 401. Combined sewer overflows.
- Sec. 402. Stormwater management.
- Sec. 403. Water conservation.

TITLE V—PERMIT PROGRAM AND ENFORCEMENT

- Sec. 501. Permit fees.
- Sec. 502. Permit program modifications.
- Sec. 503. Enforcement.

TITLE VI—PROGRAM MANAGEMENT

- Sec. 601. Technology development.
- Sec. 602. State certification.
- Sec. 603. Reports to Congress.
- Sec. 604. Definitions.
- Sec. 605. Indian programs.
- Sec. 606. Clean water education.
- Sec. 607. National estuary program.

1 (c) REFERENCES TO THE FEDERAL WATER POLLU-
 2 TION CONTROL ACT.—Whenever in this Act an amend-
 3 ment or repeal is expressed in terms of an amendment
 4 to, or repeal of, a section or other provision, the reference
 5 shall be considered to be made to a section or other provi-
 6 sion of the Federal Water Pollution Control Act (33

1 U.S.C. 1251 et seq.), except to the extent otherwise spe-
2 cifically provided.

3 **SEC. 2. FINDINGS AND PURPOSE.**

4 (a) **FINDINGS.**—Congress finds the following:

5 (1) Over the past 20 years, the Federal Water
6 Pollution Control Act has resulted in great progress
7 towards achieving the goal Congress established
8 when Congress enacted such Act in 1972: “to re-
9 store and maintain the chemical, physical, and bio-
10 logical integrity of the Nation’s waters”.

11 (2) Despite this progress, significant water pol-
12 lution problems remain. Thirty percent of the waters
13 of the United States suffer varying degrees of water
14 quality impairments, toxic pollutants remain a sig-
15 nificant threat to aquatic systems and to human
16 health, and pollution from nonpoint sources accounts
17 for significant impairments.

18 (3) There is a substantial need for water qual-
19 ity projects throughout the country. The cost of sew-
20 age treatment projects is estimated to be
21 \$80,000,000,000.

22 (4) In order to achieve further progress, addi-
23 tional resources must be made available to State and
24 municipal governments, including increased financial

1 assistance for water quality projects and increased
2 program support through permit fees.

3 (5) Substantial opportunities exist to improve
4 water pollution control by using new water pollution
5 control strategies, such as pollution prevention plan-
6 ning, water conservation, the development of innova-
7 tive pollution control technology, comprehensive wa-
8 tershed planning, and programs that protect the
9 physical and biological properties of aquatic systems.

10 (6) Substantial opportunities exist to improve
11 water pollution control by improving the operation of
12 existing programs that apply to toxic pollutants, in-
13 cluding pollutant criteria and standards, effluent
14 guidelines, pretreatment standards, and the author-
15 ity to phase out certain toxic pollutants.

16 (7) Substantial opportunities exist to improve
17 water pollution control by addressing pollution from
18 nonpoint sources, such as construction, forestry, and
19 agriculture, particularly through the use of water-
20 shed planning, targeted control measures, and finan-
21 cial assistance.

22 (8) Pollution from overflows from combined
23 storm and sanitary sewers and from stormwater dis-
24 charges continues to cause significant water quality
25 impairments. A long-range strategy for control of

1 these discharges, which recognizes financial con-
2 straints, is necessary.

3 (9) All dischargers to the waters of the United
4 States, including Federal agencies, have an obliga-
5 tion to comply with water quality laws. More can be
6 done to ensure that enforcement by Federal and
7 State governments and citizen groups is prompt and
8 effective.

9 (b) PURPOSE.—The purpose of this Act is to reau-
10 thorize the Federal Water Pollution Control Act in order
11 to provide expanded assistance to State governments, ad-
12 dress remaining water pollution control problems, employ
13 new pollution control strategies, and improve overall water
14 program implementation.

15 **TITLE I—WATER PROGRAM** 16 **FUNDING**

17 **SEC. 101. STATE REVOLVING LOAN FUNDS.**

18 (a) GRANTS TO STATES FOR ESTABLISHMENT OF
19 REVOLVING FUNDS.—

20 (1) IN GENERAL.—Subsection (a) of section
21 601 (33 U.S.C. 1381(a)) is amended to read as fol-
22 lows:

23 “(a) GENERAL AUTHORITY.—Subject to this title,
24 the Administrator shall make capitalization grants to each

1 State for the purpose of establishing a water pollution con-
2 trol revolving fund.”.

3 (2) PROJECTS ELIGIBLE FOR ASSISTANCE.—

4 Subsection (c) of section 603 (33 U.S.C. 1383(c)) is
5 amended to read as follows:

6 “(c) PROJECTS ELIGIBLE FOR ASSISTANCE.—

7 “(1) IN GENERAL.—The funds available to each
8 State water pollution control revolving fund (re-
9 ferred to in this section as the ‘fund’) may be used
10 only for providing assistance, for projects with re-
11 spect to which the principal purpose is protecting
12 and improving water quality, to a municipality,
13 intermunicipal agency, interstate agency, State agen-
14 cy, or individual, to carry out 1 or more of the fol-
15 lowing activities:

16 “(A) The construction of a publicly owned
17 treatment works, as defined in section 212.

18 “(B) Implementing an approved manage-
19 ment program under section 319.

20 “(C) Implementing an approved conserva-
21 tion and management plan under section 320.

22 “(D) Implementing a combined stormwater
23 and sanitary sewer overflow elimination pro-
24 gram.

1 “(E) Providing assistance to a subsurface
2 sewage disposal management organization ap-
3 proved by the Administrator pursuant to sec-
4 tion 319.

5 “(F) Carrying out projects identified in a
6 watershed plan prepared pursuant to section
7 321.

8 “(G) Implementing a Lakewide Manage-
9 ment Plan or Remedial Action Plan developed
10 pursuant to section 118.

11 “(H) Implementing a lake protection
12 project developed pursuant to section 314.

13 “(I) Constructing an animal waste man-
14 agement facility approved pursuant to section
15 319.

16 “(2) LIMITATION OF ASSISTANCE.—

17 “(A) DISCHARGE ACTIVITIES.—Assistance
18 provided under this subsection to an individual
19 for an activity related to a discharge shall be
20 limited to an activity not otherwise required by
21 this or other Federal law.

22 “(B) OTHER ACTIVITIES.—Assistance pro-
23 vided under this subsection for projects eligible
24 pursuant to subparagraphs (F) through (I) of
25 paragraph (1) shall be limited to projects that

1 are consistent with a watershed plan prepared
2 under section 321.

3 “(3) REVOLVING FUND.—The fund shall be es-
4 tablished, maintained, and credited with repayments,
5 and the fund shall be available in perpetuity for as-
6 sisting eligible projects.

7 “(4) ASSISTANCE FOR CONSTRUCTING PUB-
8 LICLY OWNED TREATMENT WORKS.—Assistance pro-
9 vided pursuant to subparagraphs (A) and (D) of
10 paragraph (1) may include the cost of obtaining any
11 necessary land, easement, or right-of-way with re-
12 spect to which the recipient of assistance is not the
13 owner (at the time of receipt of assistance) that is
14 directly related to the treatment plant or outfall of
15 a publicly owned treatment works, except that the
16 amount provided as assistance may not exceed the
17 assessed value of the land, easement, or right-of-
18 way.”.

19 (b) CAPITALIZATION GRANTS.—

20 (1) SPECIFIC REQUIREMENTS FOR CAPITALIZA-
21 TION GRANT AGREEMENTS.—

22 (A) CAPITALIZATION GRANT AGREE-
23 MENTS.—Section 602(b)(6) (33 U.S.C.
24 1382(b)(6)) is amended—

1 (i) by striking “1995” and inserting
2 “2001”;

3 (ii) by striking “201(g)(1),
4 201(g)(2),”; and

5 (iii) by striking “201(g)(6)”.

6 (B) GRANTS FOR CONSTRUCTION OF
7 TREATMENT WORKS.—Section 201 (33 U.S.C.
8 1281) is amended—

9 (i) in subsection (g)(5), by adding at
10 the end the following new sentence: “Not-
11 withstanding any other provision of this
12 paragraph, the Administrator may deem
13 that the requirements of this paragraph
14 have been met by a treatment works that
15 serves 10,000 or fewer individuals if the
16 treatment works has considered a group of
17 alternatives described by the Administrator
18 in guidance documents.”; and

19 (ii) in subsection (o), in the matter
20 preceding paragraph (1), by inserting after
21 “assist applicants for grant assistance
22 under this title” the following: “(except for
23 any applicant for grant assistance for a
24 publicly owned treatment works that serves
25 10,000 or fewer individuals)”.

1 (C) STATE SHARE.—The first sentence of
2 section 204(b)(1)(A) (33 U.S.C. 1284(b)(1)(A))
3 is amended by striking “proportionate”.

4 (2) DEDICATED SOURCE.—Section
5 603(d)(1)(C) (33 U.S.C. 1383(d)(1)(C)) is amended
6 by inserting “for a project eligible under subpara-
7 graph (A), (D), or (E) of subsection (c)(1)” after “a
8 loan”.

9 (3) CONSISTENCY WITH PLANNING REQUIRE-
10 MENTS.—Section 603(f) (33 U.S.C. 1383(f)) is
11 amended—

12 (A) by striking “is consistent with” and in-
13 serting “is not inconsistent with”; and

14 (B) by striking “and 320” and inserting
15 “320, and 321”.

16 (c) TECHNICAL ASSISTANCE FOR SMALL SYSTEMS.—
17 Section 602 (33 U.S.C. 1382) is amended—

18 (1) in subsection (b)—

19 (A) in paragraph (2), by inserting “except
20 as provided in subsection (c),” before “the
21 State will deposit”; and

22 (B) in paragraph (3), by inserting “except
23 as provided in subsection (c),” before “the
24 State will enter”; and

1 (2) by adding at the end the following new sub-
2 section:

3 “(c) TECHNICAL ASSISTANCE FOR SMALL SYS-
4 TEMS.—

5 “(1) DEFINITIONS.—As used in this subsection:

6 “(A) SMALL SYSTEM.—The term ‘small
7 system’ means a publicly owned treatment
8 works or a subsurface sewage disposal system
9 that serves 10,000 or fewer individuals.

10 “(B) TECHNICAL ASSISTANCE.—The term
11 ‘technical assistance’ includes technical and fi-
12 nancial management assistance provided by a
13 State to a small system. The term includes as-
14 sistance provided by a State for the planning
15 and design of a small system (referred to in
16 this subsection as ‘facility planning and de-
17 sign’).

18 “(2) VALUE OF PLANNING AND DESIGN ASSIST-
19 ANCE.—The value of planning and design assistance
20 provided to a small system shall be repaid as part
21 of any loan provided to the small system pursuant
22 to this title.

23 “(3) TECHNICAL ASSISTANCE.—

24 “(A) IN GENERAL.—

1 “(i) OFFSET.—Subject to subpara-
2 graphs (B) and (C), each State may re-
3 duce the amount that would otherwise be
4 required to be deposited by the State as
5 State matching funds under subsection
6 (b)(2) by the amount equal to the value of
7 technical assistance provided by the State,
8 from funds made available by the State.

9 “(ii) TREATMENT OF OFFSET WITH
10 RESPECT TO BINDING COMMITMENTS.—
11 Each State may reduce the amount of as-
12 sistance provided in accordance with bind-
13 ing commitments that would otherwise be
14 required under subsection (b)(3) by an
15 amount equal to the value of the offset of
16 State matching funds made pursuant to
17 this paragraph.

18 “(B) MAXIMUM OFFSET.—For each State,
19 the total amount of the offset of State matching
20 funds made pursuant to this paragraph for a
21 fiscal year may not exceed the greater of—

22 “(i) an amount equal to 2 percent of
23 the amount of the capitalization grant re-
24 ceived by the State pursuant to this sec-
25 tion; or

1 “(ii) \$100,000.

2 “(C) ASSISTANCE FOR PLANNING AND DE-
3 SIGN.—To provide assistance for a small system
4 that does not receive a loan under this title, the
5 State may use a portion of the amount referred
6 to in subparagraph (B) to provide a grant for
7 facility planning and design. The amount of the
8 grant award may not exceed 50 percent of the
9 cost of the facility planning and design.”.

10 (d) ASSISTANCE FOR DISADVANTAGED COMMU-
11 NITIES.—Subsection (h) of section 603 (33 U.S.C.
12 1383(h)) is amended to read as follows:

13 “(h) ASSISTANCE FOR DISADVANTAGED COMMU-
14 NITIES.—

15 “(1) DISADVANTAGED COMMUNITY DEFINED.
16 As used in this subsection, the term ‘disadvantaged
17 community’ means the service area of a publicly
18 owned treatment works with respect to which the av-
19 erage annual residential sewage treatment charges
20 for a user of the treatment works (referred to in this
21 subsection as ‘average annual residential user
22 charges’) is an amount greater than 1.5 percent of
23 the median household income for the service area.

24 “(2) LOAN FORGIVENESS.—In any case in
25 which the State makes a loan pursuant to subsection

1 (d)(1) to a disadvantaged community or to a com-
2 munity that the State expects to become a disadvan-
3 taged community, the State may forgive an amount
4 of the principal of the loan not to exceed the amount
5 of forgiveness required to ensure that the average
6 annual residential user charges for the service area
7 of the publicly owned treatment works that is the
8 subject of the loan does not exceed 1.5 percent of
9 the median household income for the service area.

10 “(3) GRANT OR LOAN AMOUNT.—The total
11 amount of loan forgiveness made by a State pursu-
12 ant to paragraph (2) to a disadvantaged community
13 or to a community that the State expects to become
14 a disadvantaged community may not exceed
15 \$20,000,000.

16 “(4) TOTAL AMOUNT OF LOAN FORGIVENESS.—
17 For each fiscal year, the total amount of loan for-
18 giveness made by a State pursuant to paragraph (2)
19 may not exceed 20 percent of the amount of the cap-
20 italization grant received by the State for the year.”.

21 (e) WATER POLLUTION CONTROL REVOLVING LOAN
22 FUNDS.—

23 (1) GRANTS TO CERTAIN STATES.—Section 603
24 (42 U.S.C. 1383) is amended by adding at the end
25 the following new subsection:

1 “(i) ASSISTANCE TO CERTAIN STATES.—

2 “(1) IN GENERAL.—The sums authorized to be
3 appropriated for capitalization grants under this
4 title to American Samoa, Guam, the Commonwealth
5 of the Northern Mariana Islands, the Republic of
6 Palau (pending ratification of the Compact of Free
7 Association), the United States Virgin Islands, and
8 the District of Columbia may be used for construc-
9 tion grants under title II at the request of the chief
10 executive of the entity.

11 “(2) REQUIREMENTS FOR PUBLICLY OWNED
12 TREATMENT WORKS.—

13 “(A) IN GENERAL.—Except as provided in
14 subparagraph (B), each publicly owned treat-
15 ment works that receives assistance under this
16 subsection shall be required to meet the re-
17 quirements of this Act in the same manner as
18 is required for each publicly owned treatment
19 works that receives assistance under title II.

20 “(B) EXCEPTION.—In the case of a pub-
21 licly owned treatment works in the District of
22 Columbia, the matching percentage required
23 under title II shall be 20 percent.”.

24 (2) ADMINISTRATIVE COSTS.—Section
25 603(d)(7) (33 U.S.C. 1383(d)(7)) is amended by in-

1 serting before the period at the end the following: “,
2 or, at the request of the State and with the approval
3 of the Administrator, ½ percent of the sum of the
4 total amount of the capitalization grants made to
5 the State under this title and funds deposited by the
6 State from sums made available by the State by ap-
7 propriations”.

8 (3) RESERVATION OF FUNDS.—The first sen-
9 tence of section 205(g)(1) (33 U.S.C. 1285(g)(1)) is
10 amended by striking “ending before October 1,
11 1994” and inserting “ending before October 1,
12 1997”.

13 (f) ALLOTMENT OF FUNDS.—

14 (1) IN GENERAL.—Subsection (a) of section
15 604 (33 U.S.C. 1384(a)) is amended to read as fol-
16 lows:

17 “(a) ALLOTMENT.—

18 “(1) AMOUNT ALLOTTED IN ACCORDANCE WITH
19 SECTION 205(c).—

20 “(A) IN GENERAL.—The applicable per-
21 centage of the amounts made available by ap-
22 propriation to carry out this section for each of
23 fiscal years 1995 through 2000 shall be allotted
24 by the Administrator in accordance with section
25 205(c).

1 “(B) APPLICABLE PERCENTAGE.—The ap-
 2 plicable percentage referred to in subparagraph
 3 (A) shall be—

4 “(i) 60 percent for fiscal year 1995;

5 “(ii) 40 percent for fiscal year 1996;

6 “(iii) 20 percent for fiscal year 1997;

7 and

8 “(iv) 0 percent for each of fiscal years
 9 1998 through 2000.

10 “(2) AMOUNT ALLOTTED IN ACCORDANCE WITH
 11 NEW FORMULAS.—

12 “(A) GENERAL ALLOTMENT.—

13 “(i) IN GENERAL.—The applicable
 14 percentage of the amounts made available
 15 by appropriation to carry out this section
 16 for each of fiscal years 1995 through 2000
 17 shall be allotted by the Administrator in
 18 accordance with a formula that the Admin-
 19 istrator shall establish pursuant to this
 20 subparagraph.

21 “(ii) APPLICABLE PERCENTAGE.—The
 22 applicable percentage referred to in clause
 23 (i) shall be—

24 “(I) 40 percent for fiscal year
 25 1995;

18

1 “(II) 55 percent for fiscal year
2 1996;

3 “(III) 70 percent for fiscal year
4 1997;

5 “(IV) 85 percent for fiscal year
6 1998;

7 “(V) 80 percent for fiscal year
8 1999; and

9 “(VI) 75 percent for fiscal year
10 2000.

11 “(iii) FORMULA.—

12 “(I) IN GENERAL.—Not later
13 than October 1, 1994, and every 2
14 years thereafter through October 1,
15 2000, the Administrator shall, by reg-
16 ulation, establish a formula for allot-
17 ting the amounts referred to in clause
18 (i).

19 “(II) CRITERIA FOR FORMULA.—
20 Each formula referred to in clause (i)
21 shall provide for—

22 “(aa) the allotment to each
23 State of an amount that bears
24 the same ratio to the amounts
25 made available for allotment

19

1 under this subparagraph as the
2 total amount of costs of projects
3 eligible for assistance under sec-
4 tion 603(c)(1) for the State bears
5 to the total amount of costs of
6 projects eligible for assistance
7 under section 603(c)(1) for all
8 States; and

9 “(bb) the adjustment of the
10 amounts allotted pursuant to
11 item (aa) to meet the require-
12 ments of paragraph (3).

13 “(B) ALLOTMENT FOR WATERSHED MAN-
14 AGEMENT AND PLANNING.—

15 “(i) IN GENERAL.—The applicable
16 percentage of the amounts made available
17 by appropriation to carry out this section
18 for each of fiscal years 1995 through 2000
19 shall be allotted by the Administrator for
20 watershed planning and management
21 under section 321 in accordance with a
22 formula that the Administrator shall estab-
23 lish pursuant to this subparagraph.

20

1 “(ii) APPLICABLE PERCENTAGE.—The
2 applicable percentage referred to in clause
3 (i) shall be—

4 “(I) 5 percent for fiscal year
5 1996;

6 “(II) 10 percent for fiscal year
7 1997;

8 “(III) 15 percent for fiscal year
9 1998;

10 “(IV) 20 percent for fiscal year
11 1999; and

12 “(V) 25 percent for fiscal year
13 2000.

14 “(iii) FORMULA.—

15 “(I) IN GENERAL.—Not later
16 than October 1, 1994, and every 2
17 years thereafter through October 1,
18 2000, the Administrator shall, by reg-
19 ulation, establish a formula for allot-
20 ting the amounts referred to in clause
21 (i).

22 “(II) CRITERIA FOR FORMULA.—
23 Each formula referred to in clause (i)
24 shall provide for—

21

1 “(aa) the allotment to each
2 State of an amount that bears
3 the same ratio to the amounts
4 made available for allotment
5 under this subparagraph as the
6 total amount of costs of projects
7 eligible for assistance under sec-
8 tion 603(c)(1)(F) for the State
9 bears to the total amount of
10 costs of projects eligible for as-
11 sistance under section
12 603(c)(1)(F) for all States; and

13 “(bb) the adjustment of the
14 amounts allotted pursuant to
15 item (aa) to meet the require-
16 ments of paragraph (3).

17 “(3) MINIMUM ALLOTMENT.—

18 “(A) IN GENERAL.—Except as provided in
19 subparagraph (B), the minimum percentage
20 amount of the amounts made available by ap-
21 propriation to carry out this section for each of
22 fiscal years 1995 through 2000 allotted to each
23 of the 50 States shall be ½ percent.

24 “(B) CERTAIN TERRITORIES.—

1 “(i) IN GENERAL.—A total amount
2 equal to the amount specified in clause (ii)
3 shall be allotted among the following:

4 “(I) American Samoa.

5 “(II) Guam.

6 “(III) The Commonwealth of the
7 Northern Mariana Islands.

8 “(IV) The Republic of Palau
9 (pending ratification of the Compact
10 of Free Association).

11 “(V) The United States Virgin
12 Islands.

13 “(ii) AMOUNT SPECIFIED.—The total
14 amount allotted pursuant to clause (i) shall
15 be not less than $\frac{1}{3}$ percent of the amounts
16 made available by appropriation to carry
17 out this section for each of fiscal years
18 1995 through 2000.”.

19 (2) PLANNING FUNDS.—Subsection (b) of sec-
20 tion 604 (33 U.S.C. 1384(b)) is amended to read as
21 follows:

22 “(b) RESERVATION OF FUNDS FOR PLANNING.—To
23 carry out planning under sections 205(j)(2), 303(e), and
24 321, each State shall reserve for each fiscal year the
25 greater of—

1 “(1) an amount not to exceed 3 percent of the
2 funds allotted to the State under this section for the
3 fiscal year; or

4 “(2) \$250,000.”.

5 (3) USE OF UNOBLIGATED FUNDS.—Section
6 604(c) (33 U.S.C. 1384(c)) is amended by striking
7 paragraph (2) and inserting the following new para-
8 graph:

9 “(2) USE OF UNOBLIGATED FUNDS.—

10 “(A) IN GENERAL.—Any unobligated
11 amount of any allotment to a State on the last
12 day of the 2-year period of availability estab-
13 lished under paragraph (1), shall be deposited
14 in an unobligated funds account in the Treas-
15 ury of the United States.

16 “(B) GRANTS.—Amounts in the account
17 referred to in subparagraph (A) shall be avail-
18 able to the Administrator to award grants to
19 fund 100 percent of the cost of a modification
20 or replacement of any innovative process or
21 technology funded under title II.

22 “(C) CRITERIA FOR GRANT AWARDS.—The
23 Administrator may award a grant under this
24 paragraph on the basis of a finding that the
25 process or technology has not met design per-

1 formance specifications and has significantly in-
 2 creased capitalization or operation maintenance
 3 costs, unless the failure of the process or tech-
 4 nology to meet the specifications is attributable
 5 to negligence on the part of a person.”.

6 (g) ALTERNATIVE USE OF FUNDS.—Section
 7 602(b)(3) (33 U.S.C. 1382(b)(3)) is amended by striking
 8 “120” and inserting “200”.

9 (h) AUTHORIZATION OF APPROPRIATIONS.—Section
 10 607 (33 U.S.C. 1387) is amended—

11 (1) by striking “There is authorized” and in-
 12 serting “(a) IN GENERAL.—Except as provided in
 13 subsection (b), there are authorized”;

14 (2) in subsection (a) (as so designated)—

15 (A) in paragraph (4), by striking “and” at
 16 the end;

17 (B) in paragraph (5), by striking the pe-
 18 riod at the end and inserting “; and”; and

19 (C) by adding at the end the following new
 20 paragraph:

21 “(6) \$2,500,000,000 for each of fiscal years
 22 1995 through 2000.”; and

23 (3) by adding at the end the following new sub-
 24 section:

25 “(b) DEFICIT REDUCTION.—

1 “(1) FISCAL YEARS 1996 THROUGH 1998.—If,
2 with respect to any of fiscal years 1996 through
3 1998, the estimate of the on-budget deficit contained
4 in the most recent mid-session review of the budget
5 prepared pursuant to section 1106 of title 31, United
6 States Code, does not exceed the on-budget defi-
7 cit specified for the fiscal year in section 2 of the
8 conference report to accompany House Concurrent
9 Resolution 64, setting forth the congressional budget
10 of the United States Government for fiscal years
11 1994 through 1998, as passed by the Senate on
12 April 1, 1993, the amount authorized to be appro-
13 priated under subsection (a) for the fiscal year shall
14 be increased by—

15 “(A) for fiscal year 1996, \$500,000,000;

16 “(B) for fiscal year 1997, \$1,000,000,000;

17 and

18 “(C) for fiscal year 1998, \$1,500,000,000.

19 “(2) FISCAL YEARS 1999 AND 2000.—If, with re-
20 spect to fiscal year 1999 or 2000, the estimate of
21 the on-budget deficit contained in the most recent
22 mid-session review of the budget prepared pursuant
23 to section 1106 of title 31, United States Code, does
24 not exceed the estimate for the preceding fiscal year,
25 the amount authorized to be appropriated under

1 subsection (a) for the fiscal year shall be increased
2 by—

3 “(A) for fiscal year 1999, \$2,000,000,000;

4 and

5 “(B) for fiscal year 2000,
6 \$2,500,000,000.”.

7 (i) CONSTRUCTION GRANTS.—

8 (1) AMENDMENTS TO TITLE II.—Title II (33
9 U.S.C. 1281 et seq.) is amended—

10 (A) in section 205(c)(3) (33 U.S.C.
11 1285(c)(3))—

12 (i) in the paragraph heading, by strik-
13 ing “1987–1990” and inserting “1987–2000”;

14 and

15 (ii) by striking “1987, 1988, 1989,
16 and 1990” and inserting “1987 through
17 2000”; and

18 (B) in section 218(c) (33 U.S.C. 1298(e)),
19 by striking “\$10,000,000” and inserting
20 “\$20,000,000”.

21 (2) CONSTRUCTION GRANTS.—The matter
22 under the heading “CONSTRUCTION GRANTS” under
23 the heading “ENVIRONMENTAL PROTECTION AGEN-
24 CY” in title III of the Departments of Veterans Af-
25 fairs and Housing and Urban Development, and

1 Independent Agencies Appropriations Act, 1990
 2 (Public Law 101-144; 103 Stat. 858) is amended by
 3 striking all after “Ware Shoals, South Carolina” and
 4 inserting a period.

5 **SEC. 102. STATE PROGRAM GRANTS.**

6 (a) **AUTHORIZATION OF APPROPRIATIONS.**—Section
 7 106(a) (33 U.S.C. 1256(a)) is amended—

8 (1) by inserting after “(a)” the following new
 9 subsection heading: “AUTHORIZATION OF APPRO-
 10 PRIATIONS.—”;

11 (2) in paragraph (1), by striking “and” at the
 12 end;

13 (3) in paragraph (2)—

14 (A) by inserting “and” after “1990;”;

15 (B) by striking “for grants to States” and
 16 all that follows through the end of the para-
 17 graph; and

18 (4) by adding at the end the following new
 19 paragraphs:

20 “(3) such sums as may be necessary for each
 21 of fiscal years 1991 through 1994; and

22 “(4) \$150,000,000 for each of fiscal years 1995
 23 through 2000.”.

24 (b) **STATE PROGRAM.**—Subsection (b) of section 106
 25 (33 U.S.C. 1256(b)) is amended to read as follows:

1 “(b) STATE PROGRAM.—From the sums made avail-
2 able pursuant to subsection (a), the Administrator shall
3 make grants to the States and to interstate agencies to
4 support the administration of comprehensive State water
5 pollution control programs for the prevention, reduction,
6 and elimination of water pollution, including enforcement
7 directly or through appropriate State law enforcement of-
8 ficers or agencies.”.

9 (c) ALLOTMENTS.—Subsection (c) of section 106 (33
10 U.S.C. 1256(c)) is amended to read as follows:

11 “(c) ALLOTMENTS.—

12 “(1) IN GENERAL.—Sums made available by
13 appropriation pursuant to subsection (a) for any fis-
14 cal year, other than sums reserved pursuant to para-
15 graph (2), shall be allotted to States and interstate
16 agencies on the basis of the extent of water pollution
17 problems in the respective States and the other re-
18 quirements of this section.

19 “(2) INNOVATIVE PROGRAMS.—Of the sums
20 made available by appropriation pursuant to sub-
21 section (a) for any fiscal year, an amount equal to
22 25 percent of the amount in excess of \$80,000,000
23 shall be available to the Administrator for making
24 grants to States for the support of innovative pro-
25 grams for the control and prevention of water pollu-

1 tion that have potential application to other
2 States.”.

3 (d) STATE SHARE.—Subsection (d) of section 106
4 (33 U.S.C. 1256(d)) is amended to read as follows:

5 “(d) STATE SHARE.—

6 “(1) GRANT CONDITION.—A grant made to a
7 State or interstate agency pursuant to this section
8 shall be made on the condition that the State or
9 interstate agency provide from non-Federal funds an
10 amount determined by multiplying the amount allot-
11 ted to the State or interstate agency pursuant to
12 subsection (c) by the applicable percentage specified
13 in paragraph (2).

14 “(2) APPLICABLE PERCENTAGE.—The applica-
15 ble percentage referred to in paragraph (1) shall
16 be—

17 “(A) 30 percent for fiscal year 1995;

18 “(B) 40 percent for fiscal year 1996; and

19 “(C) 50 percent for each fiscal year there-
20 after.”.

21 (e) EMERGENCY POWERS.—Section 106(e) (33
22 U.S.C. 1256(e)) is amended—

23 (1) by inserting after “(e)” the following new
24 subsection heading: “EMERGENCY POWERS.—”; and

1 (2) by striking “program—” and all that fol-
2 lows through “(2)” and inserting “program”.

3 (f) OTHER AGENCIES.—Section 106 (33 U.S.C.
4 1256) is amended by adding at the end the following new
5 subsection:

6 “(h) OTHER AGENCIES.—A State that receives a
7 grant under this section may reserve an amount equal to
8 not more than 20 percent of the amount of the grant to
9 support the participation by substate regional comprehen-
10 sive planning agencies in water quality planning activities,
11 including participation by the agencies in the development
12 and periodic revision of a continuing water quality plan-
13 ning process pursuant to section 303(e).”.

14 (g) CONFORMING AMENDMENT.—The section head-
15 ing of section 106 (33 U.S.C. 1256) is amended to read
16 as follows:

17 **“SEC. 106. GRANTS FOR POLLUTION CONTROL PROGRAM.”.**

18 **SEC. 103. GENERAL PROGRAM AUTHORIZATIONS.**

19 Section 517 (33 U.S.C. 1376) is amended—

20 (1) by striking “and” before “\$135,000,000”;
21 and

22 (2) by inserting before the period at the end the
23 following: “, such sums as may be necessary for each
24 of fiscal years 1991 through 1993, \$185,000,000 for
25 each of fiscal years 1994 and 1995, \$190,000,000

1 for each of fiscal years 1996 and 1997,
2 \$195,000,000 for each of fiscal years 1998 and
3 1999, and \$200,000,000 for fiscal year 2000.”.

4 **TITLE II—TOXIC POLLUTION**
5 **PREVENTION AND CONTROL**

6 **SEC. 201. POINT SOURCE TECHNOLOGY BASED CONTROLS.**

7 (a) **EFFLUENT GUIDELINES.**—Subsection (b) of sec-
8 tion 304 (33 U.S.C. 1314(b)) is amended to read as fol-
9 lows:

10 “(b) **EFFLUENT GUIDELINES.**—

11 “(1) **REQUIREMENTS FOR EFFLUENT GUIDE-**
12 **LINES.**—The Administrator shall, after notice and
13 opportunity for public comment, promulgate regula-
14 tions that establish effluent guidelines applicable to
15 point sources (other than publicly owned treatment
16 works) that discharge conventional, nonconventional,
17 toxic, or other pollutants to navigable waters. In
18 terms of the quantities of constituents and the
19 chemical, physical, and biological characteristics of
20 pollutants, the regulations shall—

21 “(A) reflect the application of the best
22 available technology economically achievable for
23 each category or class of sources to which the
24 effluent guideline applies;

1 “(B) for a determination of the best avail-
2 able technology economically achievable under
3 subparagraph (A), rely on, and require, to the
4 maximum extent practicable, source reduction
5 measures and practices, including changes in
6 production processes, products, or raw mate-
7 rials that reduce, avoid, or eliminate the gen-
8 eration of toxic or hazardous byproducts, taking
9 into account any adverse effects on human
10 health (including the health of workers) and the
11 environment;

12 “(C) require the elimination of the dis-
13 charge of pollutants to navigable waters in any
14 case in which the Administrator finds that the
15 elimination is technologically and economically
16 achievable for the category or class of sources
17 to which the effluent guideline applies;

18 “(D) prohibit or limit the release of pollut-
19 ants to other environmental media (including
20 ground water) to the extent that the prohibition
21 or limitation is technologically and economically
22 achievable for the category or class of sources
23 to which the effluent guideline applies; and

24 “(E) prohibit specific control measures or
25 practices that the Administrator determines are

1 likely to have a significant adverse impact on
2 any environmental medium.

3 “(2) FACTORS THAT THE ADMINISTRATOR MAY
4 CONSIDER.—In determining whether any prohibition,
5 limitation, or requirement is technologically or eco-
6 nomicly achievable for a category or class of
7 sources, the Administrator may consider, with re-
8 spect to the category or class—

9 “(A) the age of the equipment and facili-
10 ties involved;

11 “(B) the process employed;

12 “(C) the engineering aspects of the appli-
13 cation of various types of control techniques
14 and process changes (including in-plant source
15 reduction measures, in addition to end-of-pipe
16 controls);

17 “(D) the cost of achieving the limitation,
18 prohibition, or requirement; and

19 “(E) other factors that the Administrator
20 determines appropriate.”.

21 (b) NEW SOURCE PERFORMANCE STANDARDS.—

22 (1) IN GENERAL.—Paragraph (1) of section
23 306(a) (33 U.S.C. 1316(a)(1)) is amended to read
24 as follows:

1 “(1)(A) The term ‘standard of performance’ means
2 a standard for the control of the discharge of pollutants
3 that reflects the greatest degree of effluent reduction that
4 the Administrator determines to be achievable through ap-
5 plication of the best available demonstrated control tech-
6 nology, processes, operating methods, or other alter-
7 natives.

8 “(B) In determining the best available demonstrated
9 control technology, the Administrator shall—

10 “(i) rely upon and require, to the maximum ex-
11 tent practicable, source reduction measures and
12 practices, including changes in production processes,
13 products, or raw materials, that reduce, avoid, or
14 eliminate the generation of toxic or hazardous by-
15 products, taking into account any adverse effects on
16 human health (including the health of workers) and
17 the environment;

18 “(ii) eliminate the discharge of pollutants to
19 navigable waters in any case in which the Adminis-
20 trator determines that the elimination is techno-
21 logically and economically achievable for the cat-
22 egory or class of sources to which the standard
23 applies;

24 “(iii) prohibit or limit the release of pollutants
25 to other environmental media (including ground

1 water) to the extent that the prohibition or limita-
2 tion is technologically and economically achievable
3 for the category or class of sources to which the
4 standard applies; and

5 “(iv) prohibit specific control measures or prac-
6 tices that the Administrator determines are likely to
7 have a significant adverse impact on any environ-
8 mental medium.”.

9 (2) STANDARDS.—Section 306 (33 U.S.C.
10 1316) is amended—

11 (A) in subsection (b)(1)(B), by striking the
12 last 3 sentences; and

13 (B) by adding at the end the following new
14 subsection:

15 “(f) Each standard of performance established pursu-
16 ant to this section (including any revised standard estab-
17 lished pursuant to this section) shall become effective on
18 the date of proposal of the standard and shall apply to
19 all sources for which construction begins after the date
20 of proposal.”.

21 (c) PRETREATMENT STANDARDS.—

22 (1) IN GENERAL.—Subsection (b) of section
23 307 (33 U.S.C. 1317(b)) is amended to read as fol-
24 lows:

25 “(b) PRETREATMENT STANDARDS.—

1 “(1) IN GENERAL.—The Administrator shall,
2 after notice and opportunity for public comment,
3 promulgate regulations establishing pretreatment
4 standards for the introduction of toxic and
5 nonconventional pollutants into any treatment works
6 (as defined in section 212) that is publicly owned.
7 The regulations promulgated under this section
8 shall—

9 “(A) address each pollutant subject to an
10 effluent guideline under section 301 or 304 for
11 sources in the same class or category; and

12 “(B) be established to prevent the dis-
13 charge of any pollutant through the treatment
14 works, including pollutants that interfere with,
15 pass through, or prevent the beneficial reuse of,
16 or cause or contribute to the contamination of,
17 sewage sludge, or are otherwise incompatible
18 with, the treatment works.

19 “(2) REQUIREMENTS FOR PRETREATMENT
20 STANDARDS.—Each pretreatment standard shall—

21 “(A) reflect the application of the best
22 available technology economically achievable for
23 the category or class of sources to which the
24 standard applies;

1 “(B) in determining the best available
2 technology economically achievable under sub-
3 paragraph (A), rely upon and require, to the
4 maximum extent practicable, source reduction
5 measures and practices, including changes in
6 production processes, products, or raw mate-
7 rials that reduce, avoid, or eliminate the gen-
8 eration of toxic or hazardous byproducts, taking
9 into account any adverse effects on human
10 health (including the health of workers) and the
11 environment;

12 “(C) provide for the elimination of the in-
13 troduction of pollutants into any treatment
14 works in any case in which the Administrator
15 determines that the elimination is techno-
16 logically and economically achievable for the
17 category or class of sources to which the stand-
18 ard applies;

19 “(D)(i) prohibit or limit the release of pol-
20 lutants to other environmental media (including
21 ground water) to the extent that the prohibition
22 or limitation is technologically or economically
23 achievable for the category or class of sources
24 to which the standard applies; and

1 “(ii) prohibit specific control measures or
2 practices that the Administrator determines are
3 likely to have a significant adverse impact on
4 any environmental medium; and

5 “(E) be no less stringent than any effluent
6 guideline for the pollutants (other than any
7 conventional pollutant) and the category or
8 class of sources promulgated under section
9 304(b).

10 “(3) DESIGNATION OF CATEGORIES.—When
11 proposing or promulgating any pretreatment stand-
12 ard under this section, the Administrator shall des-
13 ignate the category or class of sources to which the
14 standard shall apply.

15 “(4) STATUTORY CONSTRUCTION.—Nothing in
16 this subsection is intended to affect any
17 pretreatment requirement established by the law (in-
18 cluding any regulation) of a State or a political sub-
19 division of a State, or a policy of a State or a politi-
20 cal subdivision of a State, that is more stringent
21 than any pretreatment standard for a pollutant,
22 other than a conventional pollutant, established
23 under this subsection.

24 “(5) COMPLIANCE DATE.—Each pretreatment
25 standard promulgated under this section shall speci-

1 fy a date for compliance as expeditiously as prac-
2 ticable, but not later than 3 years after the date on
3 which the standard is promulgated.”.

4 (2) SIMULTANEOUS PROMULGATION.—Section
5 307(c) (33 U.S.C. 1317(c)) is amended—

6 (A) by inserting “STANDARDS RE-
7 QUIRED.—” after “(c)”;

8 (B) by striking “In order to ensure” and
9 inserting the following:

10 “(1) NEW SOURCES.—In order to ensure”;

11 (C) by striking the last sentence of the
12 subsection and inserting the following new
13 paragraph:

14 “(2) REQUIREMENTS FOR PRETREATMENT
15 STANDARDS.—A pretreatment standard referred to
16 in paragraph (1) shall—

17 “(A) comply with the requirements of sub-
18 section (b)(1), and may be more stringent than
19 a standard promulgated under such subsection
20 for existing sources; and

21 “(B) be no less stringent than any stand-
22 ard of performance promulgated under section
23 306 for the pollutants (other than conventional
24 pollutants) and category or class of sources to
25 which the pretreatment standard applies.”.

1 (d) CONFORMING AMENDMENTS.—Section 301(b)
2 (33 U.S.C. 1311(b)) is amended—

3 (1) in paragraph (1)—

4 (A) in subparagraph (C), by striking “not
5 later than July 1, 1977” and inserting “as ex-
6 peditiously as practicable, but not later than 3
7 years after the date the limitation is issued”;
8 and

9 (B) by adding after subparagraph (C) the
10 following new sentence:

11 “A permit issued under section 402 may not contain
12 a compliance schedule for a limitation referred to in
13 subparagraph (C) if the compliance schedule is pre-
14 cluded by any State law (including any regulation)
15 or if the permit has previously included a limitation
16 applicable to the pollutant.”;

17 (2) in paragraph (2)—

18 (A) in subparagraph (A), by striking “sec-
19 tion 304(b)(2) of this Act” both places it ap-
20 pears and inserting “section 304(b)”;

21 (B) in subparagraphs (C) through (F), by
22 striking “, and in no case later than March 31,
23 1989” each place it appears; and

1 (C) in subparagraph (E), by striking “sec-
2 tion 304(b)(4) of this Act” and inserting “sec-
3 tion 304(b)”;

4 (3) in paragraph (3)(A), by striking “, and in
5 no case later than March 31, 1989”.

6 (e) SCHEDULE FOR GUIDELINES AND STANDARDS.—

7 (1) IN GENERAL.—Subsection (d) of section
8 301 (33 U.S.C. 1311(d)) is amended to read as fol-
9 lows:

10 “(d) REVISION OF EFFLUENT GUIDELINES.—

11 “(1) IN GENERAL.—Any effluent guideline (and
12 each related requirement, including any limitation)
13 required pursuant to subsection (b)(2) or promul-
14 gated under section 304(b) shall be reviewed in ac-
15 cordance with the schedule established under section
16 304(m).

17 “(2) REVISION OF GUIDELINE.—If, in the judg-
18 ment of the Administrator, there have been signifi-
19 cant changes in factors pertaining to the guidelines,
20 including advances in pollution control technology or
21 source reduction practices, that are likely to achieve
22 a significant reduction in the toxicity of pollutants
23 discharged to navigable waters by sources in the cat-
24 egory or class of sources to which an effluent guide-

1 line applies, the Administrator shall revise the guide-
2 line.

3 “(3) SIMULTANEOUS REVIEW AND REVISION.—
4 At the same time as the Administrator reviews or re-
5 vises an effluent guideline (or related requirement)
6 pursuant to this subsection, the Administrator shall
7 review or revise new source performance standards
8 promulgated pursuant to section 306 and
9 pretreatment standards for existing sources and new
10 sources promulgated pursuant to section 307 for
11 sources in the class or category of sources.”.

12 (2) PLAN FOR REVIEW.—Section 304(m) (33
13 U.S.C. 1314(m)) is amended—

14 (A) in paragraph (1)—

15 (i) by striking “(1)” and all that fol-
16 lows through “biennially” and inserting the
17 following:

18 “(1) PUBLICATION.—Not later than January 1,
19 1998, and every 5 years”;

20 (ii) in subparagraph (A)—

21 (I) by striking “annual”; and

22 (II) by inserting before the semi-
23 colon the following: “, new source per-
24 formance standards promulgated in
25 accordance with section 306, and

43

1 pretreatment standards for existing
 2 sources and new sources promulgated
 3 pursuant to section 307”;

4 (iii) in subparagraph (B)—

5 (I) by striking “discharging toxic
 6 or nonconventional pollutants”;

7 (II) by striking “(b)(2)” and in-
 8 serting “(b)”;

9 (III) by striking “section 306”
 10 and inserting “sections 306 and 307”;
 11 and

12 (iv) in subparagraph (C), by striking
 13 “3 years after the publication of the plan”
 14 and inserting “5 years after the publica-
 15 tion of the plan”;

16 (B) by adding at the end the following new
 17 paragraphs:

18 “(3) REVIEW OF INDIRECT DISCHARGE STAND-
 19 ARDS.—

20 “(A) IN GENERAL.—Except as provided in
 21 subparagraph (B), notwithstanding section
 22 301(d) and any other requirement of this sub-
 23 section, the Administrator shall, as part of the
 24 plan required to be developed by the Adminis-
 25 trator pursuant to this subsection by January

1 1, 1998, assess standards for existing sources
2 and new sources developed pursuant to section
3 307 and identify, with respect to each standard
4 applicable to pollutants that do not biodegrade,
5 any requirements of the standard that are less
6 stringent than the requirements under this sec-
7 tion and sections 301 and 306.

8 “(B) EXCEPTION.—Subparagraph (A) may
9 not apply with respect to a category or sub-
10 category of industrial sources with respect to
11 which no facility would be affected by a stand-
12 ard promulgated pursuant to section 307.

13 “(4) SIMULTANEOUS PUBLICATION.—

14 “(A) IN GENERAL.—Except as provided in
15 subparagraph (B), notwithstanding any other
16 provision of this Act, at the same time as the
17 Administrator promulgates and publishes efflu-
18 ent guidelines pursuant to section 301 and this
19 section, the Administrator shall, for each indus-
20 try that is covered by guidelines promulgated
21 pursuant to such sections, promulgate and
22 publish—

23 “(i) standards for new sources pursu-
24 ant to section 306; and

1 “(ii) pretreatment standards for exist-
2 ing sources and new sources pursuant to
3 section 307.

4 “(B) EXCEPTION.—If, with respect to the
5 pretreatment standards for existing sources re-
6 ferred to in subparagraph (A)(ii), no facility
7 would be affected by the standards, the require-
8 ments of such subparagraph may not apply
9 with respect to the existing sources.”.

10 (3) CONFORMANCE WITH CONSENT DECREE.—
11 Nothing in this Act or the amendments made by this
12 Act is intended to relieve the Administrator of any
13 requirements or obligations of the Administrator
14 under the settlement decree in *Natural Resources*
15 *Defense Council v. Reilly*, Civ. No. 89-2980 (D.D.C.
16 filed January 25, 1991).”.

17 (f) FEES.—Section 308 (33 U.S.C. 1318) is amended
18 by adding at the end the following new subsection:

19 “(e) FEES FOR ISSUANCE OF GUIDELINES AND
20 STANDARDS.—

21 “(1) IN GENERAL.—The Administrator shall,
22 not later than the date of the promulgation or revi-
23 sion of any—

1 “(A) effluent limitation or guideline pro-
2 mulgated under section 301(b) and section
3 304(b);

4 “(B) new source performance standard
5 promulgated under section 306; or

6 “(C) pretreatment standard promulgated
7 under subsections (b) and (c) of section 307,
8 identify the cost incurred by the Administrator in
9 developing the guideline or standard.

10 “(2) FEES.—The Administrator shall assess the
11 owner or operator of any facility with a permit is-
12 sued pursuant to section 402, or an individual con-
13 trol mechanism issued under section 307(b), and
14 regulated by a guideline or standard referred to in
15 paragraph (1) a fee in an amount equal to a propor-
16 tional share of the estimated cost referred to in
17 paragraph (1). The total amount of fees assessed
18 with respect to a guideline or standard shall be suffi-
19 cient to offset the full cost of developing and pub-
20 lishing the guideline or standard.

21 “(3) MODIFICATION OR WAIVER.—The Admin-
22 istrator may modify or waive an assessment de-
23 scribed in paragraph (2) on the basis of a finding
24 that—

1 “(A) a source is a small business, as de-
2 fined in section 3(a) of the Small Business Act
3 (15 U.S.C. 632); or

4 “(B) the assessment would pose an unrea-
5 sonable financial hardship for the source.

6 “(4) OTHER CONDITIONS FOR MODIFICATION.—
7 The Administrator may modify an assessment de-
8 scribed in paragraph (2) if the Administrator deter-
9 mines that the source will demonstrate new or inno-
10 vative technology.

11 “(5) SPECIAL FUND.—An amount equal to the
12 amount of assessments collected pursuant to this
13 subsection shall be placed in a special fund of the
14 United States Treasury and shall be available with-
15 out appropriation only to carry out the activities of
16 the Administrator relating to the development and
17 promulgation of effluent guidelines, new source per-
18 formance standards, and pretreatment standards
19 under this Act.

20 “(6) LIABILITY FOR ASSESSMENT.—

21 “(A) IN GENERAL.—Any discharger that—

22 “(i) applies for a permit to operate
23 pursuant to an effluent guideline for which
24 the Administrator made assessments under
25 this subsection; and

1 “(ii) should have paid an assessment
2 referred to in clause (i),
3 shall be liable for the assessment at the time
4 the permit application is filed and shall be sub-
5 ject to a penalty in an amount equal to not less
6 than 50 percent of the assessment, plus interest
7 computed in the same manner as under section
8 6621(a)(2) of the Internal Revenue Code of
9 1986 (relating to computation of interest on
10 underpayment of Federal taxes).

11 “(B) DEPOSIT IN FUND.—An amount
12 equal to the amount of any assessments, pen-
13 alties, and interest collected pursuant to this
14 paragraph shall be placed in the fund estab-
15 lished under paragraph (5).”.

16. **SEC. 202. WATER QUALITY CRITERIA AND STANDARDS.**

17 (a) **CRITERIA DOCUMENTS.**—Section 304(a) (33
18 U.S.C. 1314(a)) is amended—

19 (1) in paragraph (1)(A), by striking the semi-
20 colon at the end and inserting “and the sediment as-
21 sociated with the bodies of water; and”;

22 (2) in paragraph (2)—

23 (A) by striking “and” at the end of sub-
24 paragraphs (B) and (C); and

1 (B) by striking the period at the end of the
2 paragraph and inserting “; and (E) for toxic
3 pollutants, on numerical pollutant concentration
4 criteria that are sufficient to ensure the attain-
5 ment of designated uses established by a
6 State.”;

7 (3) in paragraph (4)—

8 (A) by inserting “(A)” after “(4)”;

9 (B) in the first sentence, by striking “fecal
10 coliform, and pH” and inserting “pathogens or
11 indicators of pathogens (or both), pH, oil, and
12 grease”; and

13 (C) by adding at the end the following new
14 subparagraph:

15 “(B) Not later than 3 years after the date of enact-
16 ment of this subparagraph, the Administrator shall pub-
17 lish criteria pursuant to paragraph (1)—

18 “(i) for those pollutants or factors that the Ad-
19 ministrator determines pose the greatest risk to the
20 physical, chemical, or biological integrity of waters
21 from all nonpoint sources; and

22 “(ii) that, on the basis of the potential for im-
23 proving water quality and enhancing the protection
24 of aquatic life and wildlife, programmatic needs, or
25 effectiveness, would provide the greatest benefit in

1 the restoration and protection of the physical, chemi-
2 cal, and biological integrity of waters, including, at
3 a minimum, nutrients, suspended solids, and dis-
4 solved oxygen.”;

5 (4) by striking paragraph (5) and inserting the
6 following new paragraph:

7 “(5)(A) Not later than 2 years after the date of en-
8 actment of the Water Pollution Prevention and Control
9 Act of 1993, and every 5 years thereafter, the Adminis-
10 trator shall prepare and publish in the Federal Register
11 a plan for the development of criteria and information pur-
12 suant to this subsection during the 5-year period begin-
13 ning on the date of publication of the plan, and, after pro-
14 viding opportunity for public review and comment, submit
15 the plan to Congress.

16 “(B) Each plan prepared pursuant to this paragraph
17 shall identify the relative need for new or revised—

18 “(i) human health criteria;

19 “(ii) aquatic life criteria for fresh waters and
20 waters of the estuarine zone, the territorial sea, the
21 contiguous zone, and the ocean;

22 “(iii) sediment quality criteria;

23 “(iv) criteria for pollutants associated with
24 nonpoint sources of pollution;

1 “(v) criteria for pollutants associated with
2 lakes;

3 “(vi) ground water criteria;

4 “(vii) biological, physical, and habitat criteria;
5 and

6 “(viii) ambient toxicity criteria.

7 “(C) Each plan prepared pursuant to this paragraph
8 shall establish a schedule for the publication of final cri-
9 teria that the Administrator determines would result in
10 the greatest benefit to human health and the environment.

11 “(D) The initial plan published pursuant to this para-
12 graph shall provide for the publication, not later than 4
13 years after the date of enactment of this subparagraph,
14 of not fewer than 8 sediment quality criteria (including
15 criteria for polychlorinated biphenyls and dioxins) that the
16 Administrator determines would result in the greatest ben-
17 efit to human health or the environment.”;

18 (5) in paragraph (6), by striking “and annually
19 thereafter, for purposes of section 301(h) of this
20 Act” and inserting “and every 5 years thereafter”;
21 and

22 (6) by adding at the end the following new
23 paragraphs:

24 “(9) Beginning on the date that is 1 year after the
25 date of enactment of this paragraph, the Administrator

1 shall, not later than the date of registration or reregistra-
2 tion of a pesticide pursuant to the Federal Insecticide,
3 Fungicide, and Rodenticide Act (7 U.S.C. 136 et seq.),
4 require the registrant to provide information sufficient to
5 publish criteria pursuant to paragraph (1) for the pes-
6 ticide, unless the Administrator determines, on the basis
7 of the proposed use of the pesticide, that it is unlikely that
8 the pesticide or any metabolite of the pesticide will enter
9 surface water. This paragraph may not apply with respect
10 to any data submitted for a registration or reregistration
11 that the Administrator determines was complete on or be-
12 fore June 1, 1993.

13 “(10) Not later than 1 year after the date of enact-
14 ment of this paragraph, the Administrator shall establish
15 a policy to ensure that information necessary to publish
16 criteria pursuant to this subsection for chemical sub-
17 stances that are the subject of a premanufacture notice
18 pursuant to section 5 of the Toxic Substances Control Act
19 (15 U.S.C. 2604) shall be submitted to the Administrator,
20 unless the Administrator finds that the chemical
21 substance—

22 “(A) will not be discharged to navigable waters
23 or to a publicly owned treatment works; or

24 “(B) will be discharged from a negligible quan-
25 tity of facilities.”.

1 (b) WATER QUALITY STANDARDS.—Section 303 (33
2 U.S.C. 1313) is amended—

3 (1) by striking subsections (a) and (b);

4 (2) by redesignating subsection (c) as sub-
5 section (a);

6 (3) by redesignating subsections (d) through (h)
7 as subsections (c) through (g); and

8 (4) in subsection (a) (as redesignated by para-
9 graph (2))—

10 (A) in second sentence of paragraph (1),
11 by inserting after “Results of such review” the
12 following: “(including the designated uses for
13 the navigable waters involved, the water quality
14 criteria for the waters based on the uses, and
15 the antidegradation policy of the State)”;

16 (B) in paragraph (2)—

17 (i) in subparagraph (A)—

18 (I) in the second sentence, by in-
19 serting “and antidegradation policy”
20 after “designated uses”;

21 (II) in the third sentence, by in-
22 serting “and sediment” after “en-
23 hance the quality of water”; and

24 (III) in the fourth sentence, by
25 striking “their use and value” and in-

1 serting “the criteria developed under
2 section 304(a), the use of the water
3 and sediment, and the value”; and
4 (ii) by adding at the end the following
5 new subparagraph:

6 “(C) Not later than 3 years after the date of enact-
7 ment of this subparagraph, each State shall adopt, as part
8 of the water quality standards of the State, a methodology
9 that allows the State to translate a narrative water quality
10 standard into a specific numeric limit for those pollutants
11 for which criteria guidance have not been published or for
12 which the State has not adopted numeric criteria pursuant
13 to section 304(a). In carrying out the preceding sentence,
14 the State shall use the provision or methodology for the
15 pollutants that cause water quality impairments.”;

16 (C) by striking paragraphs (3) and (4);
17 and

18 (D) by adding at the end the following new
19 paragraphs:

20 “(3)(A) Each use designation made under this para-
21 graph shall apply to the designated water and to the
22 aquatic sediments of the water.

23 “(B) Not later than 3 years after the date of enact-
24 ment of paragraph (5), and as part of any subsequent tri-
25 ennial review of State water quality standards, each State

1 shall report to the Administrator the designated uses of
2 waters within the State.

3 “(C) On the date that is 5 years after the date of
4 enactment of paragraph (5), all waters of the United
5 States for which a use has not been designated shall be
6 deemed to be designated as fishable and swimmable, un-
7 less a State establishes an alternative use for the waters.

8 “(4) Any chemical-specific numeric criterion pub-
9 lished pursuant to section 304(a) for a toxic pollutant
10 after the date of enactment of paragraph (5) (together
11 with the appropriate designated use) shall be deemed to
12 be the applicable standard under this section for all waters
13 unless a State objects to the application of the criterion
14 with respect to the waters of the State not later than 120
15 days after the date of publication of the criterion. If a
16 State objects to the application of the criterion by the date
17 specified in the preceding sentence, and the State adopts
18 a criterion by not later than 3 years after publication of
19 the criterion, the criterion may not apply with respect to
20 the State.

21 “(5)(A) For all waters of the State, after the date
22 of enactment of this paragraph, as expeditiously as prac-
23 ticable, but not later than 3 years after the date of publi-
24 cation of the criteria, each State shall adopt pollutant spe-
25 cific standards for any pollutant for which criteria are

1 published pursuant to section 304(a)(1) the discharge or
2 presence of which in the affected waters could reasonably
3 be expected to interfere with those designated uses adopt-
4 ed by the State, as necessary to support the designated
5 uses.

6 “(B) A State may waive the obligation to adopt a
7 standard pursuant to this paragraph for criteria that
8 apply as standards pursuant to paragraph (4).”.

9 (c) ANTIDegradation.—Section 303 (33 U.S.C.
10 1313), as amended by subsection (b), is further amended
11 by inserting after subsection (a) the following new sub-
12 section:

13 “(b) ANTIDegradation Policy.—

14 “(1) IN GENERAL.—Each State shall develop
15 and implement a statewide antidegradation policy
16 and implementation procedures for the policy. The
17 Administrator shall review and approve or dis-
18 approve the policy and any revisions to the policy
19 adopted by each State. Not later than 3 years after
20 the date of enactment of this paragraph, the Admin-
21 istrator shall promulgate and implement an
22 antidegradation policy for each State that does not
23 have a policy that has been approved by the Admin-
24 istrator by the date.

1 “(2) ANTIDEGRADATION POLICY IMPLEMENTA-
2 TION METHODS.—The methods for the implementa-
3 tion of an antidegradation policy under paragraph
4 (1) shall, at a minimum, be consistent with the fol-
5 lowing:

6 “(A) Existing instream water uses, includ-
7 ing any uses occurring on or after November
8 28, 1975, and the water and sediment quality
9 necessary to protect the existing uses, shall be
10 maintained and protected.

11 “(B)(i) Except as provided in clause (ii), if
12 the quality of waters and sediments exceeds lev-
13 els necessary to support the protection and
14 propagation of a balanced population of fish,
15 shellfish, and wildlife, and recreation in and on
16 the water, the quality shall be maintained and
17 protected.

18 “(ii) If the State finds, after public notice,
19 opportunity for public hearing, and full satisfac-
20 tion of the intergovernmental coordination pro-
21 visions of the continuing planning process of
22 the State, that allowing a reduction in the de-
23 gree of water quality or sediment quality is nec-
24 essary to accommodate important economic or
25 social development in the area in which the wa-

1 ters are located, clause (i) may not apply. In al-
2 lowing a reduction in the degree of water qual-
3 ity or sediment quality, the State shall ensure
4 a degree of water and sediment quality ade-
5 quate to protect existing uses (as described in
6 subparagraph (A)), and the State shall
7 ensure—

8 “(I) that all point sources discharging
9 to the waters, and each industrial user dis-
10 charging to a publicly owned treatment
11 works discharging to the waters for which
12 the level of water or sediment quality is to
13 be reduced, are subject to all applicable re-
14 quirements of this Act, including any
15 source reduction requirements established
16 pursuant to section 301, 304, 306, 307, or
17 401; and

18 “(II) that all nonpoint sources within
19 the State that affect or may affect the
20 water or sediment quality referred to in
21 subclause (I) are subject to enforceable
22 best management practices pursuant to
23 section 319 that are economically and tech-
24 nologically achievable for the sources.

1 “(3) OUTSTANDING NATIONAL RESOURCE WA-
2 TERS.—

3 “(A) IN GENERAL.—If a high quality
4 water constitutes an outstanding national re-
5 source (as described in subparagraph (B)), the
6 water shall be maintained and protected by the
7 State.

8 “(B) STATE DESIGNATION OF OUTSTAND-
9 ING NATIONAL RESOURCE WATERS.—

10 “(i) IN GENERAL.—Not later than 2
11 years after the date of enactment of this
12 clause, each State shall designate and im-
13 plement a program to protect all outstand-
14 ing national resource waters within the
15 State.

16 “(ii) OUTSTANDING NATIONAL RE-
17 SOURCE WATERS.—Except as provided in
18 clause (iii), the outstanding national re-
19 source waters shall include all waters with-
20 in a national park, wildlife refuge, wild and
21 scenic river system, national forest, wilder-
22 ness area, national seashore or lakeshore,
23 or national monument. The State shall also
24 designate as outstanding national resource
25 waters those waters of exceptional rec-

1 reational, cultural, or ecological signifi-
2 cance, including any water that supports a
3 population of threatened or endangered
4 species, as identified in the guidance of the
5 Administrator published pursuant to sub-
6 paragraph (C).

7 “(iii) DECISION TO DECLINE TO MAKE
8 A DESIGNATION.—A State may propose
9 not to designate a specific water as an out-
10 standing national resource water, and the
11 Administrator may, after notice and oppor-
12 tunity for comment, approve the proposal,
13 if—

14 “(I) the State demonstrates to
15 the satisfaction of the Administrator
16 that the continued designation would
17 result in important social and eco-
18 nomic harms; and

19 “(II) with respect to waters with-
20 in Federal lands (if any), the Federal
21 manager of the lands concurs with the
22 State proposal.

23 “(C) GUIDANCE.—Not later than 1 year
24 after the date of enactment of this subpara-
25 graph, the Administrator shall publish guidance

1 for States to assist in the designation and protection of outstanding national resource waters
2 of ecological, cultural, or recreational significance.
3
4

5 “(D) CONSEQUENCES OF FAILURE TO
6 DESIGNATE.—If the State fails to make the
7 designations required under this paragraph by
8 the date that is 3 years after the date of enactment of this subparagraph, the Administrator
9 shall make the designations on such date.
10

11 “(E) STATE ANTIDegradation POLICY.—
12 Each State antidegradation policy developed
13 under this subsection shall ensure that each
14 water of ecological significance designated pursuant to the guidance of the Administrator (including any water of ecological significance that
15 may have been designated as an outstanding
16 national resource water under this paragraph)
17 meets water and sediment quality standards
18 that ensure the protection and propagation of a
19 balanced population of fish, shellfish, and wildlife, and recreation in and on the water.
20
21
22

23 “(F) CITIZEN PETITION.—The State shall
24 include in the antidegradation policy of the
25 State provisions allowing any citizen of the

1 State to petition the State for the designation
2 of a particular water as an outstanding national
3 resource water.

4 “(4) ANTIDegradation REVIEW.—In order to
5 ensure that the antidegradation policy required by
6 this subsection is not violated, a permitting author-
7 ity shall conduct an antidegradation review for a
8 water prior to issuing any permit to a point source
9 authorizing any new, expanded, or increased dis-
10 charge of a pollutant to the receiving water.”.

11 (d) MIXING ZONES.—Section 303 (33 U.S.C. 1313),
12 as amended by subsection (b), is further amended by add-
13 ing at the end the following new subsection:

14 “(h) MIXING ZONES.—

15 “(1) NATIONAL POLICY.—The Administrator
16 shall, not later than 2 years after the date of enact-
17 ment of this paragraph, establish a national policy
18 concerning the use of mixing zones.

19 “(2) REQUIREMENTS FOR POLICY.—The policy
20 established under paragraph (1) shall, at a mini-
21 mum, require that—

22 “(A) no acute toxicity will result from the
23 allowed dilution;

1 “(B) any area of allowed dilution shall be
2 as small as possible and be in a shape that fa-
3 cilitates monitoring;

4 “(C) the area of allowed dilution is cal-
5 culated on the assumption of water volume at
6 minimum stream flow for the receiving water;
7 and

8 “(D) no mixing zone is allowed in waters
9 designated as outstanding national resource wa-
10 ters pursuant to subsection (g)(3).

11 “(3) STATE POLICIES.—Not later than 3 years
12 after the date of enactment of this paragraph, each
13 State shall incorporate in the water quality stand-
14 ards issued by the State a mixing zone policy that
15 is not less stringent than the national policy estab-
16 lished under this subsection.”.

17 (e) CONFORMING AMENDMENT.—Section 24 of the
18 Municipal Wastewater Treatment Construction Grant
19 Amendments of 1981 (33 U.S.C. 1313a) is amended by
20 striking “303(c)” both places it appears and inserting
21 “303(a)”.

22 **SEC. 203. TOXIC POLLUTANT PHASE-OUT.**

23 (a) EFFLUENT PROHIBITION.—Section 307(a) (33
24 U.S.C. 1317(a)) is amended—

1 (1) in paragraph (2), by striking the second
2 sentence and all that follows through the end of the
3 paragraph; and

4 (2) by striking paragraphs (3) through (7) and
5 inserting the following new paragraphs:

6 “(3)(A) Not later than 1 year after the publication
7 of a list pursuant to paragraph (4), the Administrator
8 shall, by regulation, prohibit the discharge of any toxic
9 pollutant listed pursuant to paragraph (4). The regulation
10 shall apply to any discharges regulated pursuant to section
11 402 or an industrial user regulated pursuant to subsection
12 (b).

13 “(B) Each regulation issued pursuant to this para-
14 graph shall specify acceptable analytical methods and a
15 compliance level.

16 “(C) The regulation shall provide a process for the
17 Administrator to adjust a prohibition pursuant to this
18 paragraph to provide an offset for the amount of a prohib-
19 ited pollutant in the water supply of the source in a man-
20 ner consistent with section 129 of title 40, Code of Federal
21 Regulations (as in effect on October 1, 1993).

22 “(D) The Administrator may exempt a category of
23 sources from the requirements of this paragraph if the Ad-
24 ministrator determines that compliance by the category

1 with the requirements of such paragraph is not techno-
2 logically feasible.

3 “(4) Not later than 2 years after the date of enact-
4 ment of the Water Pollution Prevention and Control Act
5 of 1993, and every 5 years thereafter, the Administrator
6 shall publish proposed regulations listing those pollutants
7 that the Administrator determines to—

8 “(A) be highly toxic or toxic and highly
9 bioaccumulative; and

10 “(B) occur in surface water predominately as a
11 result of discharges.

12 “(5)(A) On receiving a petition from any person, the
13 Administrator may add a pollutant to the list established
14 pursuant to paragraph (4). Each person who petitions for
15 the listing of an additional pollutant pursuant to this para-
16 graph shall submit to the Administrator sufficient infor-
17 mation to make a determination under paragraph (4) not
18 later than 1 year before the date specified in paragraph
19 (4) for the publication of a list. The Administrator shall
20 include in a notice in the Federal Register concerning the
21 establishment of the list the basis for the decision of the
22 Administrator to list or decline to list a pollutant ad-
23 dressed in a petition submitted to the Administrator pur-
24 suant to this paragraph.

1 “(B) If, on receipt of a petition referred to in sub-
2 paragraph (A), the Administrator determines that the ad-
3 dition of a pollutant to the list is warranted, but that—

4 “(i) the immediate proposal and timely promul-
5 gation of a final regulation listing the pollutant in
6 accordance with this subsection is precluded by other
7 actions under this subsection concerning the listing
8 of a pollutant; and

9 “(ii) expeditious progress is being made to list
10 pollutants pursuant to this subsection, with respect
11 to which the listing requirements of this subsection
12 are no longer appropriate,

13 the Administrator shall promptly publish the determina-
14 tion in the Federal Register, together with a description
15 and evaluation of the reasons and the data on which the
16 determination is based.

17 “(6)(A) Each toxic pollutant prohibition established
18 pursuant to this subsection shall take effect as expedi-
19 tiously as practicable but not later than 5 years after the
20 date of promulgation of the regulation establishing a pro-
21 hibition under this subsection.

22 “(B) If, at the end of the maximum compliance pe-
23 riod under subparagraph (A), the Administrator deter-
24 mines for a source or category of sources that—

1 “(i) a prohibited pollutant cannot be eliminated
2 through the use of alternative substances or proc-
3 esses; and
4 “(ii) the source is making the maximum use of
5 available technology,
6 the Administrator may extend the compliance period for
7 the source or category of sources for a period of 5 years,
8 and may on the termination of the period, on the basis
9 of the criteria referred to in clauses (i) and (ii), extend
10 the compliance period for the period specified in this sub-
11 paragraph.”.

12 (b) LISTING PROCESS.—Section 307(a)(1) (33
13 U.S.C. 1317(a)(1)) is amended—

14 (1) by striking the second sentence and insert-
15 ing the following new sentence: “The Administrator
16 is authorized to add or remove from the list any pol-
17 lutant and shall, not later than 1 year after the date
18 of enactment of the Water Pollution Prevention and
19 Control Act of 1993, and not less often than every
20 5 years thereafter, review and revise the list.”; and

21 (2) in the third sentence, by inserting “poten-
22 tial for bioaccumulation,” after “degradability,”.

23 (c) REPORT ON DEVELOPMENTAL EFFECTS.—Not
24 later than 3 years after the date of enactment of this Act,
25 the Administrator shall submit to Congress a report pro-

1 viding a comprehensive review and assessment of the ef-
2 fects of pollutants found in navigable waters on the devel-
3 opment of aquatic species, wildlife, and humans, including
4 impairments to reproduction, endocrine, and immune sys-
5 tems caused by the pollutants.

6 **SEC. 204. PRETREATMENT PROGRAM.**

7 (a) PERMIT AUTHORITY.—Section 402(b)(9) (33
8 U.S.C. 1342(b)(9)) is amended by adding at the end the
9 following new sentences: “The Administrator (or a State
10 with authority to approve a pretreatment program under
11 this Act) may impose requirements on industrial users
12 that introduce pollutants into publicly owned treatment
13 works and that are not subject to the requirements of a
14 pretreatment program that has been approved by the ap-
15 propriate authority (referred to in this paragraph as an
16 ‘approved pretreatment program’). The requirements shall
17 include requirements that are equivalent to the require-
18 ments that a publicly owned treatment works with an ap-
19 proved pretreatment program is required to impose pursu-
20 ant to the regulations issued under this Act, shall include
21 pretreatment standards, and may reflect best professional
22 judgment.”.

23 (b) REMOVAL CREDITS.—Section 307(b) (33 U.S.C.
24 1317(b)), as amended by section 201(c)(1), is further

1 amended by adding at the end the following new para-
2 graph:

3 “(6) If in the case of any toxic pollutant listed pursu-
4 ant to subsection (a) introduced by a source into a publicly
5 owned treatment works—

6 “(A) the treatment by the treatment works re-
7 sults in the biodegradation of the toxic pollutant, as
8 determined by the Administrator;

9 “(B) the discharge from the treatment works
10 does not violate the effluent limitation or standard
11 that would be applicable to the toxic pollutant if the
12 pollutant were discharged by the source other than
13 through a publicly owned treatment works; and

14 “(C) the toxic pollutant does not prevent sludge
15 use or disposal by the treatment works in accord-
16 ance with section 405,

17 the pretreatment requirements for the sources actually
18 discharging the toxic pollutant into the publicly owned
19 treatment works may be revised by the owner or operator
20 of the works to reflect the biodegradation of the toxic pol-
21 lutant by the works.”.

22 (c) DOMESTIC SEWAGE EXCLUSION.—Section 307
23 (33 U.S.C. 1317) is amended by adding at the end the
24 following new subsection:

25 “(f) DOMESTIC SEWAGE EXCLUSION.—

1 “(1) IN GENERAL.—Beginning on the date that
2 is 3 years after the date of enactment of this sub-
3 section, the term ‘but does not include solid or dis-
4 solved material in domestic sewage’ may not, for the
5 purpose of paragraph (27) of section 1004 of the
6 Solid Waste Disposal Act (42 U.S.C. 6903(27)), be
7 interpreted, construed, or applied to exclude from
8 the definition of solid waste under such paragraph
9 any pollutant introduced by a source into a treat-
10 ment works (as defined in section 212), unless—

11 “(A) the pollutant and source are subject
12 to a pretreatment standard promulgated by the
13 Administrator under this section and the source
14 is in compliance with the standard;

15 “(B)(i) the Administrator has promulgated
16 a schedule for establishing a pretreatment
17 standard pursuant to section 304(m) that
18 would be applicable to the pollutant and source
19 not later than 5 years after the date of enact-
20 ment of this subsection and the standard is pro-
21 mulgated on or before the date established in
22 the schedule; or

23 “(ii) the pollutant and source are subject
24 to a local limit and the local limit for the pollut-
25 ant and source is equivalent to the best dem-

1 onstrated available treatment technology as de-
2 termined by the Administrator under section
3 3004(m) of the Solid Waste Disposal Act (42
4 U.S.C. 6924(m)) or a pretreatment standard
5 equivalent to a standard under subsection (b)
6 or section 402(b)(9).

7 “(2) PROHIBITION ON INTRODUCTION OF HAZ-
8 ARDOUS WASTE.—It shall be unlawful to introduce
9 into a publicly owned treatment works any pollutant
10 that is a hazardous waste. Notwithstanding the pro-
11 visions of this Act, a publicly owned treatment works
12 (as defined in section 212) receiving or treating any
13 hazardous waste shall not be deemed to be generat-
14 ing, treating, storing, disposing of, or otherwise
15 managing a hazardous waste for the purposes of this
16 Act, solely on the basis that any other person has
17 introduced a hazardous waste into the collection sys-
18 tem for such publicly owned treatment works.”.

19 **SEC. 205. POLLUTION PREVENTION PLANNING.**

20 Section 308 (33 U.S.C. 1318), as amended by section
21 201(e), is further amended by adding at the end the fol-
22 lowing new subsection:

23 “(f) POLLUTION PREVENTION PLANNING.—

24 “(1) IN GENERAL.—

1 “(A) REGULATIONS.—Not later than 2
2 years after the date of enactment of this sub-
3 section, the Administrator shall promulgate reg-
4 ulations that require a person described in
5 paragraph (2) who applies for the issuance or
6 reissuance of a permit pursuant to section 402,
7 or for a local limit for a significant industrial
8 user determined under section 307, to submit a
9 pollution prevention plan to the permitting au-
10 thority (in the case of a direct discharger), or
11 the permitting authority of the State for the ap-
12 propriate publicly owned treatment works (in
13 the case of a local limit) as a condition of the
14 issuance or reissuance of the permit or local
15 limit.

16 “(B) REQUIREMENTS FOR REGULA-
17 TIONS.—The regulations referred to in subpara-
18 graph (A) shall identify not fewer than 20 pol-
19 lutants with respect to which the Administrator
20 determines that discharge reductions are likely
21 to result in a benefit to human health or the
22 environment.

23 “(C) POTENTIAL FOR POLLUTANT REDUC-
24 TION.—The regulations shall indicate the poten-

1 tial for pollutant reduction within categories or
2 subcategories of dischargers.

3 “(2) POLLUTION PREVENTION PLANNING RE-
4 QUIREMENT.—The Administrator shall identify the
5 persons who are required to comply with paragraph
6 (1). In identifying the persons, the Administrator
7 shall provide that, not later than 7 years after the
8 date of enactment of this subsection, not less than
9 80 percent of the volume of each pollutant listed
10 pursuant to paragraph (1)(B) released into waters
11 at the time of the identification is subject to plans
12 prepared pursuant to this subsection.

13 “(3) REQUIREMENTS FOR POLLUTION PREVEN-
14 TION PLANS.—

15 “(A) IN GENERAL.—Each pollution pre-
16 vention plan prepared pursuant to this sub-
17 section shall—

18 “(i) address pollutants listed pursuant
19 to section 307(a) with respect to which the
20 discharger is required to report under sec-
21 tion 313 of the Emergency Planning and
22 Community Right-to-Know Act of 1986
23 (42 U.S.C. 11023); and

24 “(ii) with respect to a direct dis-
25 charger, be submitted as part of the appli-

1 cation for the issuance or the reissuance of
2 a permit under section 402, and with re-
3 spect to a person subject to a pretreatment
4 requirement, be submitted to the permit-
5 ting authority.

6 “(B) MINIMUM REQUIREMENTS FOR
7 PLAN.—Each pollution prevention plan referred
8 to in subparagraph (A) shall, at a minimum—

9 “(i) establish goals for pollution pre-
10 vention (including the reduction in the use
11 of pollutants, byproduct generation, and
12 in-process recycling) over the term of a
13 permit referred to in paragraph (1), or the
14 period during which a local limit referred
15 to in paragraph (1) applies;

16 “(ii) address water use efficiency;

17 “(iii) include onsite plans for the at-
18 tainment of the goals established under
19 clause (i); and

20 “(iv) provide for annual reports to the
21 agency that issues a permit concerning
22 progress toward attainment of the goals
23 established under clause (i).

24 “(C) GUIDANCE.—Not later than 4 years
25 after the date of enactment of this subsection,

1 the Administrator shall issue guidance that in-
 2 dicates the range of the potential and dem-
 3 onstrated reduction in pollution under pollution
 4 prevention plans submitted pursuant to this
 5 subsection.

6 “(D) AVAILABILITY OF PLANS.—

7 “(i) IN GENERAL.—The pollution pre-
 8 vention plan for each facility shall be re-
 9 tained at the facility, and, for purposes of
 10 administering this Act, shall be available to
 11 the Administrator, the State in which the
 12 facility is located, and any local govern-
 13 ment agency given authority by the State
 14 to inspect the plans. Any documents and
 15 other records obtained or reviewed may not
 16 be deemed to be public records or docu-
 17 ments.

18 “(ii) AVAILABILITY TO THE PUBLIC.—
 19 The pollution prevention plan summaries
 20 for each facility shall be made available to
 21 the public at the facility during normal
 22 business hours.

23 “(4) REPORT TO CONGRESS.—Not later than 5
 24 years after the date of enactment of this subsection,
 25 the Administrator shall submit a report to Congress

1 that describes the pollutant reductions accomplished
 2 pursuant to plans prepared pursuant to this sub-
 3 section.”.

4 **TITLE III—WATERSHED PLAN-**
 5 **NING AND NONPOINT POLLU-**
 6 **TION CONTROL**

7 **SEC. 301. WATER QUALITY MONITORING.**

8 (a) STATE WATER QUALITY MONITORING PRO-
 9 GRAMS.—Subsection (b) of section 305 (33 U.S.C.
 10 1315(b)) is amended to read as follows:

11 “(b)(1) Each State shall conduct a comprehensive
 12 program to monitor the quality of navigable waters and
 13 aquatic sediment within the State.

14 “(2) Each State monitoring program conducted pur-
 15 suant to this subsection shall, at a minimum—

16 “(A) assess whether the waters of the State (in-
 17 cluding the rivers, lakes, and coastal waters of the
 18 State)—

19 “(i) provide for the protection and propa-
 20 gation of a balanced population of shellfish,
 21 fish, and wildlife; and

22 “(ii) allow for recreation in and on the wa-
 23 ters;

24 “(B) identify waters that do not meet a water
 25 quality standard (including a designated use);

1 “(C) assess the contribution of point and
2 nonpoint sources to the water pollution problems of
3 the State referred to in subparagraphs (A) and (B);
4 and

5 “(D) provide that monitoring activities in the
6 State be scheduled, to the extent practicable, to pro-
7 vide for continuous collection of information over
8 each period that is the subject of a report submitted
9 pursuant to paragraph (5).

10 “(3) Not later than 2 years after the date of enact-
11 ment of this paragraph, the Administrator shall promul-
12 gate regulations that specify minimum requirements for
13 each State monitoring program conducted pursuant to this
14 subsection.

15 “(4) Each State monitoring program conducted pur-
16 suant to this subsection—

17 “(A) shall coordinate the assessment of water
18 and sediment quality within the State;

19 “(B) in coordinating the assessment referred to
20 in subparagraph (A), may draw on data from—

21 “(i) the monitoring programs of Federal
22 agencies;

23 “(ii) the monitoring of dischargers pursu-
24 ant to section 308; and

25 “(iii) volunteer monitoring programs;

1 “(C) may collect and assess original data that
2 is necessary to supplement the data sources referred
3 to in subparagraph (B); and

4 “(D) shall be conducted in coordination and co-
5 operation with the Water Quality Monitoring Coun-
6 cil established under subsection (c).

7 “(5)(A) Each State shall prepare for all waters within
8 the State and submit to the Administrator not later than
9 August 1, 1995, information on the attainment and main-
10 tenance of water quality. The information required under
11 this paragraph shall be updated with information supplied
12 by the States not less frequently than every 5 years.

13 “(B) The State shall publish a report on the monitor-
14 ing program, including a compilation of the data, not later
15 than 5 years after the date of enactment of this para-
16 graph, and every 5 years thereafter.

17 “(C) Each State shall include in each report referred
18 to in subparagraph (A) data collected from hydrologic
19 study units and fixed monitoring stations operated by
20 Federal agencies.

21 “(6) The Administrator shall ensure that—

22 “(A) the data provided in the reports submitted
23 pursuant to paragraph (5) are maintained in a re-
24 pository on a continuous basis by the Environmental
25 Protection Agency; and

1 “(B) the repository is updated in a timely fash-
2 ion.”.

3 (b) WATER QUALITY MONITORING COUNCIL.—Sec-
4 tion 305 (33 U.S.C. 1315) is amended by adding at the
5 end the following new subsection:

6 “(c)(1) There is established a Water Quality Monitor-
7 ing Council (referred to in this subsection as the ‘Coun-
8 cil’). The Council shall give advice with respect to the co-
9 ordination of Federal and State water quality monitoring
10 programs.

11 “(2) The Council shall be composed of—

12 “(A) a representative of the Administrator, who
13 shall be a cochairperson of the Council;

14 “(B) a representative of the Director of the
15 United States Geological Survey, who shall be a co-
16 chairperson of the Council;

17 “(C) 3 representatives of appropriate Federal
18 agencies appointed by the President (after receiving
19 recommendations from the Administrator);

20 “(D) 3 representatives of State environmental
21 protection agencies, appointed by the Administrator;

22 “(E) 3 representatives of the academic commu-
23 nity, appointed by the Administrator; and

1 “(F) 3 representatives of volunteer water qual-
2 ity monitoring organizations, appointed by the Ad-
3 ministrators.

4 “(3) The Council shall, at a minimum—

5 “(A) review and make recommendations regard-
6 ing the implementation of Federal water and sedi-
7 ment quality monitoring programs;

8 “(B) review and make recommendations regard-
9 ing the implementation of State water monitoring
10 programs pursuant to subsection (b);

11 “(C) recommend consistent quality assurance
12 standards for monitoring programs implemented
13 pursuant to this section;

14 “(D) recommend procedures and methods for
15 statistical analysis of monitoring data; and

16 “(E) assist in the effective coordination of data
17 management systems.

18 “(4) Members of the Council may not be compensated
19 for any travel expenses incurred, and may not receive any
20 compensation, by reason of service on the Council.

21 “(5)(A) Not later than 2 years after the date of en-
22 actment of this subsection, the President, after consider-
23 ing the recommendations of the Council, shall submit to
24 Congress a strategy for the coordinated implementation
25 of water quality monitoring programs.

1 “(B) The strategy referred to in subparagraph (A)
2 shall—

3 “(i) review and assess the location and function
4 of fixed monitoring stations and hydrologic study
5 units; and

6 “(ii) describe—

7 “(I) the roles and responsibilities of Fed-
8 eral agencies;

9 “(II) methods of coordination among agen-
10 cies, including procedures to ensure the imple-
11 mentation of the strategy;

12 “(III) the anticipated level of resources to
13 be devoted to monitoring programs by each
14 agency; and

15 “(IV) measures to ensure that Federal
16 monitoring programs are responsive to the mon-
17 itoring needs of States to the fullest extent
18 practicable.

19 “(6)(A) The Administrator, in cooperation with the
20 Council, shall prepare and submit to Congress, on January
21 1, 1996, and every 5 years thereafter, a report that—

22 “(i) describes the findings of monitoring pro-
23 grams conducted pursuant to this section; and

1 “(ii) provides a comprehensive assessment of
2 conditions and trends in the quality of navigable wa-
3 ters throughout the United States.

4 “(B) The report referred to in subparagraph (A)
5 shall also identify needed changes to Federal and State
6 monitoring programs, including the adequacy of funding
7 for the accomplishment of the programs provided for in
8 this section.”.

9 **SEC. 302. COMPREHENSIVE WATERSHED MANAGEMENT.**

10 Title III (33 U.S.C. 1311 et seq.) is amended by add-
11 ing at the end the following new section:

12 **“SEC. 321. COMPREHENSIVE WATERSHED MANAGEMENT.**

13 **“(a) FINDINGS AND PURPOSE.—**

14 **“(1) FINDINGS.—**Congress finds that com-
15 prehensive watershed management will further the
16 goals and objectives of this Act by—

17 **“(A)** identifying more fully water quality
18 impairments and the pollutants, sources, and
19 activities causing impairments;

20 **“(B)** integrating water protection quality
21 efforts under this Act with other natural re-
22 source protection efforts, including Federal ef-
23 forts to define and protect ecological systems
24 (including the waters and the living resources
25 supported by the waters);

1 “(C) defining long-term social, economic
2 and natural resource objectives and the water
3 quality necessary to attain or maintain the ob-
4 jectives;

5 “(D) increasing, through citizen participa-
6 tion in the watershed management process,
7 public support for improved water quality;

8 “(E) identifying priority water quality
9 problems that need immediate attention; and

10 “(F) identifying the most cost-effective
11 measures to achieve the objectives of this Act.

12 “(2) PURPOSE.—The purpose of this section is
13 to encourage comprehensive watershed management
14 in maintaining and enhancing water quality, in re-
15 storing and protecting living resources supported by
16 the waters, and in ensuring waters of a quality suffi-
17 cient to meet human needs, including water supply
18 and recreation.

19 “(b) DESIGNATION OF WATERSHEDS.—

20 “(1) IN GENERAL.—The Governor of a State
21 may at any time designate waters (including ground
22 waters) and associated land areas within the State
23 as a watershed management unit. To the extent
24 practicable, the boundaries of each watershed man-
25 agement unit shall be consistent with the

1 hydrological units identified by the United States
2 Geological Survey of the Department of the Interior
3 as the most appropriate units for planning purposes.

4 “(2) REQUIREMENTS FOR DESIGNATION.—Each
5 designation under paragraph (1) shall include an
6 identification of the waters within the watershed
7 management unit that are not meeting water or
8 sediment quality standards (including designated
9 uses) at the time of the designation. Each designa-
10 tion under paragraph (1) shall also identify any out-
11 standing national resource water and sensitive
12 aquatic or wildlife habitat area within the watershed
13 management unit that is the subject of the designa-
14 tion.

15 “(3) WATERSHED MANAGEMENT UNIT.—

16 “(A) IN GENERAL.—Each watershed man-
17 agement unit referred to in paragraph (1) shall,
18 to the extent practicable, include the land area
19 occupied by all sources of pollution that are
20 causing, or contributing to, an impairment
21 identified pursuant to paragraph (2).

22 “(B) MULTISTATE UNITS.—Each water-
23 shed management unit established under this
24 subsection may include waters and associated
25 land areas in more than 1 State, if the Gov-

1 ernors of the States affected jointly designate
2 the watershed management unit.

3 “(4) DESIGNATION.—Each designation of a wa-
4 tershed management unit made pursuant to this
5 subsection, and each corresponding management en-
6 tity designated under paragraph (1) or (2) of sub-
7 section (c), shall be submitted to the Administrator
8 for approval. The Administrator shall approve the
9 designation not later than 180 days after the date
10 of submittal, if the designation meets the require-
11 ments of this section. If the Administrator dis-
12 approves the designation, the Administrator shall
13 notify the State in writing of the reasons for dis-
14 approval. The State may resubmit the designation
15 amended to meet the objections of the Adminis-
16 trator.

17 “(c) MANAGEMENT ENTITY.—

18 “(1) IN GENERAL.—The Governor of a State
19 shall determine the entity responsible for developing
20 and implementing a plan for each watershed man-
21 agement unit designated under this section. The
22 management entity may be an agency of State gov-
23 ernment, a local government agency, a substate re-
24 gional planning organization, a conservation district
25 or other natural resource management district, or

1 any other public or nonprofit entity with the capac-
2 ity to carry out the responsibilities authorized by
3 this section, as set forth by the Administrator in the
4 guidance required under subsection (i).

5 “(2) MULTISTATE MANAGEMENT ENTITY.—If a
6 watershed management unit is designated to include
7 land area in more than 1 State, the Governors of the
8 States affected shall jointly determine the appro-
9 priate management entity.

10 “(3) ELIGIBILITY FOR ASSISTANCE.—If the Ad-
11 ministrator determines that the management entity
12 identified by the Governor has adequate powers to
13 carry out the responsibilities authorized by this sec-
14 tion, the entity shall be eligible for assistance under
15 subsection (f).

16 “(d) WATERSHED MANAGEMENT AND PLANNING AC-
17 TIVITIES.—Watershed management and planning activi-
18 ties eligible to receive assistance from the Administrator
19 under this Act include, with respect to a watershed—

20 “(1) characterizing the waters and land uses of
21 the watershed management unit (including the exist-
22 ing, designated, and potential uses of the waters, the
23 living resources supported by the waters, sensitive
24 habitats within the watershed, and other natural, so-

1 cial and economic values that may be affected by
2 water quality within the watershed);

3 “(2) identifying problems related to water qual-
4 ity within the watershed (including impairments and
5 threats to the existing, designated, and potential
6 uses, pollutants of concerns, and sources of pollut-
7 ants causing threats or impairments);

8 “(3) selecting short-term and long-term goals
9 for watershed management (including the mainte-
10 nance or restoration of water quality, sediment qual-
11 ity, aquatic and wildlife habitat, and living resources
12 supported by the waters of the watershed);

13 “(4) selecting measures and practices to meet
14 identified goals (including the allocation of pollutant
15 load reductions among sources of pollution within
16 the watershed and the design of remedial actions
17 necessary to restore uses);

18 “(5) identifying and coordinating specific
19 projects and activities necessary to reduce pollutant
20 loadings or to restore water quality or aquatic habi-
21 tat within the watershed (including identifying Fed-
22 eral, State, local, and other financial resources need-
23 ed to support the projects and activities); and

24 “(6) identifying the appropriate institutional ar-
25 rangements to carry out a plan approved pursuant

1 to subsection (g) and ensuring compliance with
2 schedules and limits established by the management
3 process.

4 “(e) PUBLIC PARTICIPATION.—To the maximum ex-
5 tent practicable, each State shall establish procedures, in-
6 cluding the establishment of technical and citizens’ advi-
7 sory committees, to encourage the public to participate in
8 developing the comprehensive watershed management pro-
9 gram under this section.

10 “(f) SUPPORT FOR WATERSHED MANAGEMENT AND
11 PLANNING.—

12 “(1) INTERAGENCY COMMITTEE.—There is es-
13 tablished an interagency committee to support com-
14 prehensive watershed management and planning.
15 The President shall appoint the members of the
16 committee. The members shall include a representa-
17 tive from each Federal agency that carries out pro-
18 grams and activities that may have a significant im-
19 pact on water quality or other natural resource val-
20 ues that may be appropriately addressed through
21 comprehensive watershed management. In appoint-
22 ing members to the committee, the President may
23 include such representatives from a State or local
24 government and individuals from any affected indus-
25 try, public or private educational institution, and the

1 general public as the Administrator determines ap-
2 propriate.

3 (2) COMPENSATION.—Members of the Council
4 may not be compensated for any travel expenses in-
5 curred, and may not receive any compensation, by
6 reason of service on the Council.

7 “(3) USE OF OTHER FUNDS UNDER THIS
8 ACT.—The planning and management activities car-
9 ried out by a management entity pursuant to this
10 section may be carried out with funds made avail-
11 able pursuant to section 106(h), 205(j), 319(e), or
12 604(b) (or any combination thereof).

13 “(g) APPROVED PLANS.—

14 “(1) IN GENERAL.—The Governor of a State
15 may submit to the Administrator for approval a
16 comprehensive watershed management plan devel-
17 oped pursuant to this section. The Administrator
18 shall, after notice and opportunity for public com-
19 ment, approve or disapprove a comprehensive water-
20 shed management plan submitted by a Governor
21 pursuant to this subsection. The Administrator shall
22 approve the plan if the plan satisfies each of the fol-
23 lowing conditions:

1 “(A) The plan has been developed for a
2 watershed management unit designated and ap-
3 proved pursuant to subsection (b).

4 “(B) The entity with responsibility to carry
5 out the plan has the legal authority and finan-
6 cial resources to carry out the plan.

7 “(C) Except as provided in subparagraph
8 (D), if the watershed includes waters that are
9 not meeting water or sediment quality stand-
10 ards at the time of submission—

11 “(i) the plan—

12 “(I) identifies the pollutants and
13 sources causing the impairment; and

14 “(II) demonstrates that the
15 standards will be attained as expedi-
16 tiously as practicable, but not later
17 than 10 years after the date of sub-
18 mittal of the plan; and

19 “(III) includes periodic deter-
20 minations to ensure reasonable fur-
21 ther progress within the economic ca-
22 pability of the sources within the wa-
23 tershed is made toward attaining the
24 standards; and

1 “(ii) the plan includes a list of
2 projects and activities necessary to achieve
3 allocated load reductions consistent with
4 the requirements of section 303(b), and—

5 “(I) identifies those projects of
6 highest priority; and

7 “(II) includes milestones for the
8 implementation of the projects and ac-
9 tivities.

10 “(D) In the case of a watershed with re-
11 spect to which pollutant loads are attributable
12 only to point sources the plan demonstrates
13 that the standards will be attained not later
14 than 5 years after the date of enactment of this
15 section and that periodic determinations will be
16 made to determine that reasonable further
17 progress within the economic capability of the
18 sources within the watershed during the period
19 specified is made.

20 “(E) For those waters in the watershed at-
21 taining water quality standards at the time of
22 submission, the plan identifies those projects
23 and activities necessary to maintain water qual-
24 ity standards in the future.

1 “(F) Any other condition the Adminis-
2 trator may establish by guidance or regulation.

3 “(2) PLANNING AND IMPLEMENTATION SCHED-
4 ULE.—Each plan submitted and approved under this
5 subsection shall include a planning and implementa-
6 tion schedule for a period of at least 5 years. The
7 approval of the Administrator of a plan shall apply
8 for a period not to exceed 5 years. A revised and up-
9 dated plan may be submitted prior to the expiration
10 of the period specified in the preceding sentence for
11 approval pursuant to the same conditions and re-
12 quirements that apply to any initial plan for a wa-
13 tershed that is approved pursuant to this subsection.

14 “(3) DELEGATION OF AUTHORITY.—

15 “(A) IN GENERAL.—The Administrator
16 may delegate to a State the authority to ap-
17 prove watershed plans under this subsection,
18 if—

19 “(i) the State submits a program to
20 the Administrator that is no less stringent
21 than the guidance issued under subsection
22 (i); and

23 “(ii) the Administrator approves the
24 State program and the Administrator peri-
25 odically reviews State decisions to approve

1 specific watershed plans to determine
2 whether the plans comply with the require-
3 ments of this subsection and the guidance
4 issued by the Administrator.

5 “(B) REVOCATION.—If at any time after
6 delegating authority to a State pursuant to sub-
7 paragraph (A), the Administrator determines
8 that a State is not meeting a requirement re-
9 ferred to in such subparagraph, the Adminis-
10 trator may revoke the delegation.

11 “(h) INCENTIVES FOR WATERSHED PLANNING.—

12 “(1) PROJECTS AND ACTIVITIES.—Projects and
13 activities identified in an approved plan as necessary
14 for attainment and maintenance of water and sedi-
15 ment quality standards applicable to the waters
16 within the watershed management unit, and not oth-
17 erwise required by this or other Federal law, shall—

18 “(A) be eligible for funding under section
19 603(c)(1)(F);

20 “(B) be included in any needs assessment
21 conducted pursuant to section 516; and

22 “(C) be eligible for funding under section
23 604(a)(2)(C).

24 “(2) ACTIVITIES OF FEDERAL AGENCIES.—

1 “(A) IN GENERAL.—Each activity of a
2 Federal agency that affects land use, water
3 quality, or the natural resources within a water-
4 shed planning unit for which a plan has been
5 approved pursuant to subsection (g) shall be
6 carried out in a manner that is consistent with
7 the policies established in the plan.

8 “(B) EXEMPTION.—Notwithstanding sub-
9 paragraph (A), the President may exempt a
10 Federal agency activity from the requirements
11 of a plan approved under subsection (g) if the
12 President determines that it is in the para-
13 mount interest of the United States to exempt
14 the Federal agency.

15 “(3) LIMITATION.—

16 “(A) IN GENERAL.—Notwithstanding sec-
17 tion 301(b)(1)(C), and subject to the require-
18 ments of section 402(o), the Administrator or a
19 State may issue a permit to a point source that
20 includes a limitation for a pollutant to be dis-
21 charged by the source to a specific portion of a
22 navigable water that does not ensure attain-
23 ment and maintenance of water quality stand-
24 ards (alone, or in combination with, limitations

1 issued for other point sources discharging to
2 the water), if—

3 “(i) the water is part of a watershed
4 management unit for which a plan has
5 been approved under subsection (g); and

6 “(ii) the plan includes enforceable re-
7 quirements that have been imposed under
8 State or local law for nonpoint source pol-
9 lution load reductions that, in combination
10 with the limitations established for point
11 sources, provide for the attainment and
12 maintenance of water quality standards for
13 the waters prior to expiration of the plan.

14 “(B) EXTENSION OF TERM.—Notwith-
15 standing section 402(b)(1)(B), the Adminis-
16 trator or a State is authorized to grant an ex-
17 tension of the term of any permit issued pursu-
18 ant to section 402 for a period not to exceed 4
19 years after the date of enactment of this section
20 for any source—

21 “(i) that is located in an area that is
22 designated as a watershed planning unit;
23 and

24 “(ii) for which the Governor of the
25 State indicates to the Administrator in

1 writing, prior to the expiration date of the
2 permit (as in effect on the date of enact-
3 ment of this section), an intention to pre-
4 pare and submit a watershed management
5 plan for approval under subsection (g).

6 “(4) EXTENSION FOR APPROVED PLAN.—Not-
7 withstanding section 402(b)(1)(B), the term of a
8 permit issued to a point source under section 402
9 may be extended to be a term of 10 years for any
10 point source located in a watershed management
11 unit for which a plan has been approved under sub-
12 section (g), if the plan provides for the attainment
13 and maintenance of water quality standards (includ-
14 ing designated uses) in waters affected by the dis-
15 charge from the point source that is the subject of
16 the permit for the entire term of the permit subject
17 to the extension. Notwithstanding the preceding sen-
18 tence, any permit issued pursuant to this section
19 shall be renewed and revised as necessary to attain
20 and maintain water quality standards if at any time
21 during the term of the permit the waters affected by
22 the discharge do not meet water quality standards.

23 “(i) GUIDANCE.—Not later than 18 months after the
24 date of enactment of this section, the Administrator shall
25 issue guidance for the comprehensive watershed manage-

1 ment and planning under this section that specifies mini-
 2 mum requirements for watershed designation, legal au-
 3 thorities and financial resources for management entities,
 4 public participation, and elements necessary for approval
 5 of a watershed management plan pursuant to subsection
 6 (g).

7 “(j) STATE WATER LAW.—Nothing in this section is
 8 intended to amend, supersede, or abrogate any right to
 9 a quantity of water that has been established by any inter-
 10 state water compact, Supreme Court decree, State water
 11 law, or any requirement imposed, or right provided under,
 12 any Federal or State environmental or public health law.”.

13 **SEC. 303. IMPAIRED WATERS IDENTIFICATION.**

14 Subsection (a) of section 319 (33 U.S.C. 1329(a)) is
 15 amended to read as follows:

16 “(a) IMPAIRED WATERS.—

17 “(1) IMPAIRED WATERS.—

18 “(A) IN GENERAL.—Not later than 2 years
 19 after the date of enactment of clause (i), each
 20 State shall submit to the Administrator a list of
 21 waters within the State that cannot, without
 22 additional action to control nonpoint sources of
 23 pollution, reasonably be anticipated to attain or
 24 maintain—

1 “(i) water quality standards for the
2 waters; or

3 “(ii) a water quality that will ensure
4 the protection of public health and public
5 water supplies, and the protection and
6 propagation of a balanced population of
7 shellfish, fish, and wildlife and allow for
8 recreational activities in and on the water.

9 “(B) CONTENTS OF LIST.—A list submit-
10 ted pursuant to this paragraph shall include, at
11 a minimum, waters listed pursuant to sections
12 304(l)(1)(A) and 319(a)(1)(A) for which indi-
13 vidual control strategies have been promulgated,
14 unless the State demonstrates that the waters
15 do not meet the listing criteria referred to in
16 subparagraph (A).

17 “(C) ADDITIONS TO LIST.—

18 “(i) ACTION BY A STATE.—A State
19 may add to the list submitted to the Ad-
20 ministrator pursuant to subparagraph (A)
21 any waters within the State that the State
22 determines to be—

23 “(I) threatened with impairment;

24 or

1 “(II) an outstanding national re-
2 source water, as designated pursuant
3 to section 303(g).

4 “(ii) ACTION BY THE ADMINIS-
5 TRATOR.—The Administrator may add a
6 water to a list submitted by a State, or ex-
7 pand an area identified pursuant to sub-
8 paragraph (E) if the water meets the list-
9 ing criteria referred to in subparagraph
10 (A).

11 “(D) FAILURE BY STATE.—In any case in
12 which a State fails to submit a list pursuant to
13 this paragraph by the date specified in subpara-
14 graph (A), the Administrator shall carry out
15 the requirements of this paragraph not later
16 than 1 year after the date specified.

17 “(E) DELINEATION OF WATERSHED.—The
18 list prepared pursuant to this paragraph shall
19 include a delineation of the land area within the
20 State of the watershed of a listed water. The
21 delineated area shall include all sources of pol-
22 lution within the State that cause, or contribute
23 to, the impairment of the water quality of the
24 water. In any case in which the watershed areas
25 of individual impaired waters overlap, a State

1 may combine waters to form a single watershed
2 area for the purposes of the inclusion of the wa-
3 tershed area on the list prepared pursuant to
4 subparagraph (A).

5 “(F) PUBLIC REVIEW AND COMMENT.—

6 Each State shall provide an opportunity for
7 public review and comment on the list prepared
8 pursuant to this paragraph and shall, at a mini-
9 mum, hold at least 1 public hearing concerning
10 the list not later than 60 days prior to submit-
11 tal of the list to the Administrator.

12 “(G) PETITION.—Any person may submit

13 to the State in which the person resides a peti-
14 tion for the listing of a water pursuant to this
15 paragraph. In any case in which a petition es-
16 tablishes that a water meets the listing criteria
17 referred to in subparagraph (A), or in the case
18 of a petition for listing pursuant to paragraph
19 (4) if the waters meet the requirements of para-
20 graph (4), the State shall add the waters to the
21 list prepared pursuant to subparagraph (A).

22 “(H) APPROVAL BY ADMINISTRATOR.—

23 The Administrator shall review each list re-
24 quired to be prepared pursuant to this para-
25 graph not later than 90 days after receipt of

1 the list. If the Administrator finds that the list
2 is consistent with the requirements of this sub-
3 section, the Administrator shall, after notice
4 and opportunity for public comment, approve
5 the list. The approval or disapproval by the Ad-
6 ministrator of a list shall constitute final agency
7 action for the purposes of section 509. The
8 court shall not set aside or reward a decision to
9 list a water unless the court decides, on the
10 basis of the rulemaking record, that the deci-
11 sion was arbitrary and capricious, or otherwise
12 in violation of law.

13 “(2) REASSESSMENT OF IMPAIRED WATERS.—
14 Not later than 7 years after the date of enactment
15 of subparagraph (A), and every 5 years thereafter,
16 each State shall submit to the Administrator a list
17 of waters and a description of watershed areas of
18 the waters in a manner consistent with the proce-
19 dures for listing a watershed under paragraph (1).
20 The list shall also include waters that fail to meet—

21 “(A) biological monitoring regulations es-
22 tablished pursuant to the information published
23 pursuant to section 304(a)(8); or

1 “(B) standards for pollutants adopted pur-
2 suant to section 303 associated with nonpoint
3 sources.”.

4 **SEC. 304. NONPOINT POLLUTION CONTROL.**

5 (a) **MANAGEMENT PROGRAM REVISION.**—Section
6 319 (33 U.S.C. 1329) is amended—

7 (1) in subsection (b)—

8 (A) in paragraph (1)—

9 (i) by inserting before “The Governor
10 of each State” the following new sentence:
11 “Not later than 30 months after the date
12 of enactment of the Water Pollution Pre-
13 vention and Control Act of 1993, the Gov-
14 ernor of each State shall prepare and sub-
15 mit to the Administrator a revised man-
16 agement program.”; and

17 (ii) by adding at the end of the para-
18 graph the following new sentence: “Each
19 management program prepared under this
20 subsection shall be consistent with the
21 guidance developed under subsection (c).”;

22 (B) in paragraph (2)—

23 (i) in subparagraph (A), by striking
24 “paragraph (1)(B),” and all that follows
25 through the end of the subparagraph and

- 1 inserting the following: "subsection
2 (c)(2)(A), except that the State may ex-
3 empt a category of sources on the basis of
4 a demonstration to the Administrator that
5 the category of sources does not cause im-
6 pairment to the waters within the State.";
- 7 (ii) in subparagraph (B), by adding at
8 the end the following new sentence: "Ex-
9 cept for categories, subcategories, or
10 sources addressed pursuant to subsection
11 (f), the programs and management prac-
12 tices shall be consistent with guidance pub-
13 lished pursuant to subsection (c).";
- 14 (iii) by striking subparagraph (C) and
15 inserting the following new subparagraph:
16 "(C) A schedule containing annual mile-
17 stones for the implementation of management
18 measures as expeditiously as practicable but not
19 later than 3 years after the date of approval of
20 the program for new sources";
- 21 (iv) by redesignating subparagraphs
22 (E) and (F) as subparagraphs (F) and
23 (G), respectively; and
- 24 (v) by inserting after subparagraph
25 (D) the following new subparagraph:

1 “(E) For any source in a category or class
2 of sources listed in guidance developed under
3 subsection (c) that is also in the watershed de-
4 lineated under section 319(a)(1)—

5 “(i) the implementation of manage-
6 ment measures as expeditiously as prac-
7 ticable, but not later than 3 years after the
8 date of approval of the program; or

9 “(ii) the development of site-specific
10 water quality plans pursuant to subsection
11 (f) as expeditiously as practicable, but not
12 later than 3 years after the date of ap-
13 proval of the program, including appro-
14 priate agreements with the Secretary of
15 Agriculture or appropriate State agencies
16 for the development of each plan.”;

17 (C) by striking paragraph (3) and insert-
18 ing the following new paragraph:

19 “(3) REVISION OF PLANS.—

20 “(A) IN GENERAL.—Not later than 7 years
21 after the date of enactment of the Water Pollu-
22 tion Prevention and Control Act of 1993, each
23 State shall review and revise the plan developed
24 pursuant to paragraph (2) in a manner consist-
25 ent with the requirements of this section.

1 “(B) SITE-SPECIFIC WATER QUALITY
2 PLANS.—Each plan submitted pursuant to this
3 paragraph may provide for the implementation
4 of site-specific water quality plans pursuant to
5 paragraph (2)(E)(ii) only if the plan is for a
6 source within the watershed area of an im-
7 paired water with respect to which the Adminis-
8 trator has approved a watershed plan pursuant
9 to section 321.

10 “(C) ENFORCEMENT.—Each plan devel-
11 oped pursuant to this paragraph shall provide
12 for the necessary legal authority to ensure the
13 implementation of management measures for
14 existing sources and new sources and measures
15 required under plans developed under a pro-
16 gram referred to in subsection (b). The legal
17 authority shall include, at a minimum, the au-
18 thority to seek injunctive relief for the failure to
19 implement a measure referred to in the preced-
20 ing sentence.

21 “(D) FAILURE TO SUBMIT PLAN.—If a
22 State fails to submit a plan pursuant to this
23 paragraph, or the Administrator does not ap-
24 prove the plan, not later than 1 year after the
25 deadline for the submittal of the plan to the

1 Administrator, or 1 year after the Adminis-
2 trator disapproves the plan, the Administrator
3 shall publish a regulation providing for the im-
4 plementation of enforceable minimum control
5 measures for categories of sources in the State
6 that is consistent with this subsection. The Ad-
7 ministrator may use the sums allocated to the
8 State under subsection (h) to implement the
9 regulation (including making grants to substate
10 agencies approved by the Administrator pursu-
11 ant to subsection (e)).”;

12 (D) by striking paragraph (4) and insert-
13 ing the following new paragraph:

14 “(4) PUBLIC AND AGENCY INVOLVEMENT.—In
15 developing and implementing a management pro-
16 gram under this subsection, a State shall provide for
17 public review and comment and shall cooperate with
18 local, State, and interstate entities.”; and

19 (E) by adding at the end the following new
20 paragraphs:

21 “(5) ECONOMIC CAPABILITY.—A State may,
22 with the approval of the Administrator, adopt alter-
23 native requirements with respect to a specific
24 nonpoint source of pollution based on a showing by

1 the owner or operator of the source that the modi-
2 fied requirements will—

3 “(A) represent the maximum use of man-
4 agement measures and practices within the eco-
5 nomic capability of the owner or operator; and

6 “(B) result in reasonable further progress
7 toward elimination of pollution.

8 “(6) DEFINITIONS.—As used in this section:

9 “(A) EXISTING SOURCE.—The term ‘exist-
10 ing source’ means any nonpoint source, cat-
11 egory, or subcategory of sources that is not a
12 new source.

13 “(B) NEW SOURCE.—The term ‘new
14 source’ means any source, category, or sub-
15 category of sources that is described in one of
16 the following clauses:

17 “(i) The development or significant
18 redevelopment of a commercial or residen-
19 tial site of 5 or more acres that is not sub-
20 ject to a stormwater permit issued under
21 section 402(p).

22 “(ii) The construction or significant
23 reconstruction of a road, highway, or
24 bridge that is not subject to a stormwater
25 permit issued under section 402(p).

1 “(iii) The harvesting of timber or the
2 construction of a forest road.

3 “(iv) The construction or significant
4 expansion of an animal feeding operation
5 that is not subject to a permit issued
6 under section 402.

7 “(v) A category or subcategory of new
8 sources established by the Administrator
9 under subsection (c).

10 “(vi) A source, category, or sub-
11 category of sources designated as a new
12 source by a State.”;

13 (2) by striking subsection (c) and inserting the
14 following new subsection:

15 “(c) NATIONAL PROGRAM GUIDANCE.—

16 “(1) IN GENERAL.—The Administrator, in con-
17 sultation with the heads of other Federal agencies,
18 shall publish guidance that specifies elements of
19 nonpoint pollution management programs.

20 “(2) GUIDANCE CONTENTS.—The guidance
21 published under this subsection shall include, at a
22 minimum—

23 “(A) a description of categories and
24 subcategories of sources of nonpoint pollution;

1 “(B) management measures appropriate to
2 each category or subcategory of source identi-
3 fied in subparagraph (A), including a descrip-
4 tion of each method or practice, structural or
5 nonstructural control, and operation and main-
6 tenance procedure, that constitutes each meas-
7 ure;

8 “(C) program implementation criteria ap-
9 propriate to ensure the implementation of man-
10 agement measures;

11 “(D) methods to estimate reductions in
12 nonpoint pollution loads necessary to attain and
13 maintain water quality and sediment quality
14 standards and achieve the goals and require-
15 ments of this Act; and

16 “(E) any necessary monitoring to assess
17 over time the success of management measures
18 in reducing nonpoint pollution loads and im-
19 proving water quality.

20 “(3) PUBLICATION OF GUIDANCE.—Not later
21 than 90 days after the date of enactment of this
22 paragraph, the Administrator shall publish proposed
23 guidance pursuant to this subsection, and the Ad-
24 ministrator shall publish final guidance not later
25 than 180 days after such date of enactment.

1 “(4) REVIEW.—The Administrator shall provide
2 the heads of interested Federal agencies, States, and
3 other interested persons with an opportunity to pro-
4 vide written comments on proposed guidance under
5 this subsection.

6 “(5) REGIONAL VARIATION.—The Adminis-
7 trator may, on the recommendation of an adminis-
8 trator of a regional office of the Environmental Pro-
9 tection Agency, modify management measures pur-
10 suant to paragraph (2)(B) to reflect special condi-
11 tions in the region under the jurisdiction of the ad-
12 ministrator of the regional office. The modification
13 shall apply to each State in the region.

14 “(6) DEFINITIONS.—As used in this subsection:

15 “(A) MANAGEMENT MEASURES.—The term
16 ‘management measures’ means economically
17 achievable measures for the control of the addi-
18 tion of pollutants from existing sources and new
19 sources (as defined in subsection (b)(6)) that
20 reflect the greatest degree of pollutant reduc-
21 tion achievable through the application of the
22 best available nonpoint pollution control prac-
23 tices, technologies, processes, siting criteria, op-
24 erating methods, or other alternatives.

1 “(B) PROGRAM IMPLEMENTATION CRI-
2 TERIA.—The term ‘program implementation
3 criteria’ means specified characteristics of a
4 program that will result in the effective and re-
5 liable implementation of management measures
6 and the maintenance of the management meas-
7 ures over the long-term. In establishing the cri-
8 teria, the Administrator shall consider any pro-
9 grams in effect that have been demonstrated by
10 1 or more States to be effective and reliable
11 means of ensuring the implementation and
12 maintenance of a management measure. The
13 term shall include appropriate State statutes,
14 county or municipal ordinances, financial assist-
15 ance programs, and related enforceable authori-
16 ties.”;

17 (3) in subsection (d)—

18 (A) in paragraph (1)—

19 (i) in the first sentence, by striking
20 “report or” both places it appears; and

21 (ii) in the third sentence, by striking
22 “report, management program,” both
23 places it appears, and inserting “manage-
24 ment program”;

25 (B) in paragraph (2)—

1 (i) in subparagraph (A), by striking
2 “(b)(2)” and inserting “(b)”;

3 (ii) in subparagraph (C), by striking
4 “sufficiently expeditious” and inserting
5 “consistent with the guidance referred to
6 in subsection (c)”;

7 (iii) in subparagraph (D), by inserting
8 before “adequate to reduce the level of pol-
9 lution in navigable waters” the following
10 “consistent with the guidance referred to
11 in subsection (c), or otherwise not”; and

12 (C) by striking paragraph (3) and insert-
13 ing the following new paragraph:

14 “(3) GRANT ADJUSTMENT AND REALLOCATION
15 OF FUNDS.—

16 “(A) GRANT ADJUSTMENT—Beginning
17 with fiscal year 1998, and for each fiscal year
18 thereafter, no grant funds available to a State
19 under this section shall be awarded to a State
20 without a management program that has been
21 approved by the Administrator pursuant to sub-
22 section (b).

23 “(B) REALLOCATION OF FUNDS.—Begin-
24 ning with fiscal year 1998, and for each fiscal
25 year thereafter, in the case of a State that does

1 not have a management program that has been
2 approved by the Administrator under subsection
3 (b), the Administrator shall reserve a propor-
4 tionate share for the State of the amount of the
5 grant awarded pursuant to subsection (h) for
6 the preceding fiscal year. The Administrator
7 shall first allocate an amount of the amount re-
8 served among local management programs with-
9 in the State that have been approved pursuant
10 to subsection (e) in such amounts as the Ad-
11 ministrator determines to be appropriate. Any
12 funds that the Administrator does not allocate
13 in accordance with the preceding sentence to
14 support programs approved pursuant to sub-
15 section (e), shall be made available to States
16 that have a program approved by the Adminis-
17 trator under subsection (b)."; and

18 (4) in the first sentence of subsection (e), by
19 striking ", with the approval of such State,".

20 (b) GRANT ASSISTANCE.—Section 319 (33 U.S.C.
21 1329) is amended—

22 (1) in subsection (h)—

23 (A) by striking paragraph (5) and insert-
24 ing the following new paragraph:

25 "(5) ALLOTMENT OF GRANT FUNDS.—

1 “(A) IN GENERAL.—From the sums appro-
2 priated in any fiscal year, the Administrator
3 shall allocate funds in accordance with such fac-
4 tors as the Administrator considers appropriate.

5 “(B) RESERVATION OF FUNDS.—For fiscal
6 years 1996 and 1997, prior to the allotment of
7 funds pursuant to subparagraph (A), the Ad-
8 ministrator shall reserve an amount equal to 50
9 percent of the funds available for allotment for
10 the fiscal year for allotment to States on the
11 basis of the ratio of the number of acres of wa-
12 tershed areas of waters listed pursuant to sub-
13 section (a) in the State to the total number of
14 acres of watershed areas of waters listed pursu-
15 ant to such section.

16 “(C) ALLOTMENT.—Beginning with fiscal
17 year 1998, and for each fiscal year thereafter,
18 prior to allotting funds pursuant to subpara-
19 graph (A), the Administrator shall reserve an
20 amount equal to 50 percent of the funds avail-
21 able for allotment to States on the basis of the
22 estimate of the cost of implementing site-spe-
23 cific water quality plans prepared pursuant to
24 subsection (f) within the watershed area of a
25 water with respect to which the Administrator

1 has approved a watershed plan pursuant to sec-
2 tion 321.”;

3 (B) in paragraph (6), in the first sentence,
4 by inserting before the period at the end the
5 following: “, and shall remain available for the
6 following fiscal year;”;

7 (C) by striking paragraph (7) and insert-
8 ing the following new paragraph:

9 “(7) LIMITATION ON USE OF FUNDS.—

10 “(A) IN GENERAL.— Each State may use
11 funds from a grant made pursuant to this sec-
12 tion to provide financial assistance to a person
13 only to the extent that the assistance is related
14 to the—

15 “(i) cost of a demonstration project;

16 “(ii) incentive grant; or

17 “(iii) land acquisition or conservation
18 easement.

19 “(B) LIMITATION ON INCENTIVE
20 GRANTS.—An incentive grant may be made only
21 if—

22 “(i) no other source of Federal assist-
23 ance is available to implement the meas-
24 ure;

1 “(ii) the amount of funding for a
2 project provided pursuant to this sub-
3 section does not exceed 50 percent of the
4 cost of the project, and the difference be-
5 tween the amount of the funding provided
6 pursuant to this subsection and the cost of
7 the project is paid from non-Federal
8 sources;

9 “(iii) the amount of the grant does
10 not exceed \$5,000 per year;

11 “(iv) the Administrator determines be-
12 fore awarding the grant that the measure
13 assisted by the grant has a design life in
14 excess of 5 years;

15 “(v) in making the grants available,
16 the State will give highest priority to areas
17 identified by the State under subsection
18 (a);

19 “(vi) in making the grants available,
20 the State will give highest priority to per-
21 sons with the greatest financial need; and

22 “(vii) not more than 50 percent of all
23 funds made available to a State under this
24 section shall be available for incentive
25 grants.

1 “(C) LIMITATION ON LAND ACQUISITION
2 AND INCENTIVE GRANTS.—A land acquisition
3 or conservation easement may be funded under
4 this paragraph only if—

5 “(i) in the case of conservation ease-
6 ment, the conservation easement is consist-
7 ent with a site-specific control plan; and

8 “(ii) the amount of funds used for the
9 purposes specified in this subparagraph
10 does not exceed an amount equal to 30
11 percent of the total amount of funds made
12 available as grants to a State under this
13 subsection.

14 “(D) INCENTIVE GRANT DEFINED.—As
15 used in this paragraph, the term ‘incentive
16 grant’ means a grant to an individual to imple-
17 ment a site-specific water quality plan devel-
18 oped pursuant to subsection (f).”;

19 (D) in paragraph (12), by inserting “and
20 incentive grants” after “demonstration
21 projects”; and

22 (E) by adding at the end the following new
23 paragraph:

24 “(13) FAILURE TO IMPLEMENT.—If the Admin-
25 istrator determines that a State has substantially

1 failed to implement a plan, or develop site-specific
2 water quality plans, the Administrator shall withhold
3 not less than 25 percent, and not more than 50 per-
4 cent, of the funds that would otherwise have been
5 available to the State pursuant to this subsection.
6 The amount of funds withheld pursuant to this
7 paragraph shall be allocated to States with a pro-
8 gram approved by the Administrator pursuant to
9 subsection (b) and local management programs with-
10 in the States that have been approved pursuant to
11 subsection (e).”; and

12 (2) in subsection (j), by inserting after the first
13 sentence the following new sentence: “There are au-
14 thorized to be appropriated to carry out subsection
15 (h) an amount not to exceed \$300,000,000 for fiscal
16 year 1995, \$500,000,000 for each of fiscal years
17 1996 through 1998, and \$600,000,000 for each of
18 fiscal years 1999 and 2000.”.

19 (c) **SITE-SPECIFIC WATER QUALITY PLANS.**—Sub-
20 section (f) of section 319 (33 U.S.C. 1329(f)) is amended
21 to read as follows:

22 “(f) **SITE-SPECIFIC WATER QUALITY PLANS.**—

23 “(1) **IN GENERAL.**—

24 “(A) **SITE-SPECIFIC WATER QUALITY**
25 **PLANS.**—Each source, including an agricultural

1 source, that is located in the watershed area of
2 a water listed pursuant to subsection (a)(1)
3 may implement a site-specific water quality
4 plan in lieu of implementing management meas-
5 ures, as described in subsection (c).

6 “(B) Each plan developed pursuant to this
7 subsection shall be approved by the appropriate
8 official of a Federal agency or State agency, as
9 specified in the plan developed under subsection
10 (b). With respect to agricultural sources that
11 implement a plan referred to in the preceding
12 sentence, the Secretary of Agriculture shall as-
13 sist the States in the development and imple-
14 mentation of the plans to the fullest extent
15 practicable.

16 “(2) REQUIREMENTS FOR PLAN.—

17 “(A) IN GENERAL.—Each plan developed
18 pursuant to this subsection shall—

19 “(i) provide for the implementation of
20 management measures that are appro-
21 priate to the site, economically achievable
22 by the owner or operator of the source,
23 and will reduce water pollution;

1 “(ii) recognize and incorporate appro-
2 priate management measures in place at
3 the site at the time the plan is developed;

4 “(iii) establish schedules for the im-
5 plementation of management measures as
6 expeditiously as practicable, but not later
7 than 3 years after the date of initiation of
8 the plan;

9 “(iv) provide for a periodic assessment
10 of the implementation of the plan and the
11 effect of management measures; and

12 “(v) terminate on the date that is 5
13 years after the date of initiation of the
14 plan.

15 “(B) MAINTENANCE.—After an initial plan
16 has been prepared pursuant to this subsection,
17 each subsequent plan prepared pursuant to this
18 subsection shall provide for the maintenance of
19 appropriate measures that have been incor-
20 porated in a preceding plan, unless the appro-
21 priate official determines that a measure is no
22 longer necessary to maintain water quality
23 standards.

24 “(3) HANDBOOK.—Not later than 18 months
25 after the date of enactment of this paragraph, and

1 as appropriate thereafter, the Administrator, in con-
2 sultation with the Secretary of Agriculture and the
3 heads of other appropriate Federal agencies and the
4 States, shall publish a handbook to assist the devel-
5 opment of plans for agricultural sources pursuant to
6 this subsection.

7 “(4) EFFECT OF CONSERVATION COMPLIANCE
8 PLAN.—

9 “(A) IN GENERAL.—Any agricultural
10 source required to have a plan prepared pursu-
11 ant to this subsection that has satisfied a con-
12 servation compliance plan developed pursuant
13 to subtitle B of title 12 of the Food Security
14 Act of 1985 (16 U.S.C. 3830 et seq.) shall be
15 deemed to satisfy the requirement of paragraph
16 (1) until the date specified in subsection (a)(3).

17 “(B) SUBSEQUENT PERIOD.—After the
18 date specified in subsection (a)(3), a conserva-
19 tion compliance plan that meets the applicable
20 requirements of a comprehensive watershed
21 management plan developed under section 321
22 shall be deemed to satisfy the requirements of
23 paragraph (1).”

24 (d) FEDERAL PROGRAM COORDINATION.—

25 (1) AGRICULTURAL COST-SHARE PROGRAMS.—

1 (A) AMENDMENTS TO THE SOIL CON-
2 SERVATION AND DOMESTIC ALLOTMENT ACT.—

3 (i) PREVENTION OF SOIL EROSION.—

4 The first sentence of section 7(a) of the
5 Soil Conservation and Domestic Allotment
6 Act (16 U.S.C. 590g(a)) is amended by in-
7 serting “, giving priority consideration to
8 watersheds of waters identified pursuant to
9 section 319(a) of the Federal Water Pollu-
10 tion Control Act (33 U.S.C. 1329(a))” be-
11 fore the period.

12 (ii) PRIORITY FOR CERTAIN WATER-
13 SHEDS.—The fourth undesignated para-
14 graph of section 8(b) of the Soil Conserva-
15 tion and Domestic Allotment Act (16
16 U.S.C. 590h(b)) is amended by inserting
17 before the comma at the end of subpara-
18 graph (D) the following: “, giving priority
19 consideration to watersheds of waters iden-
20 tified pursuant to section 319(a) of the
21 Federal Water Pollution Control Act (33
22 U.S.C. 1329(a))”.

23 (B) AGRICULTURAL WATER QUALITY PRO-
24 TECTION PROGRAM.—Section 1238C(a) of the

1 Food Security Act of 1985 (16 U.S.C.
2 3838c(a)) is amended—

3 (i) in paragraph (7), by striking “or”
4 at the end;

5 (ii) in paragraph (8), by striking the
6 period at the end and inserting “; or”; and

7 (iii) by adding at the end the follow-
8 ing new paragraph:

9 “(9) the watershed of a water identified pursu-
10 ant to section 319(a) of the Federal Water Pollution
11 Control Act (33 U.S.C. 1329(a)).”.

12 (C) ENVIRONMENTAL EASEMENT PRO-
13 GRAM.—Section 1239(b)(1) of the Food Secu-
14 rity Act of 1985 (16 U.S.C. 3839(b)(1)) is
15 amended—

16 (i) in subparagraph (B), by striking
17 “or” at the end;

18 (ii) in subparagraph (C), by striking
19 the period at the end and inserting “; or”;
20 and

21 (iii) by adding at the end the follow-
22 ing new subparagraph:

23 “(D) is located within the watershed of a
24 water identified pursuant to section 319(a) of

1 the Federal Water Pollution Control Act (33
2 U.S.C. 1329(a)).”.

3 (D) CONSERVATION PRIORITY AREAS.—
4 Section 1231(f)(1) of the Food Security Act of
5 1985 (16 U.S.C. 3831(f)(1)) is amended by
6 adding at the end the following new sentence:
7 “The Secretary shall designate watershed areas
8 of waters identified pursuant to section 319(a)
9 of the Federal Water Pollution Control Act (33
10 U.S.C. 1329(a)) as conservation priority
11 areas.”.

12 (2) CONSERVATION RESERVE PROGRAM.—Sec-
13 tion 319(k) (33 U.S.C. 1329(k)) is amended—

14 (A) by striking “The Administrator shall
15 transmit” and inserting the following:

16 “(1) IN GENERAL.—The Administrator shall
17 transmit”; and

18 (B) by adding at the end the following new
19 paragraphs:

20 “(2) AGRICULTURAL PROGRAM COORDINA-
21 TION.—

22 “(A) IN GENERAL.—The Administrator
23 shall provide technical assistance to the Sec-
24 retary of Agriculture with respect to utilizing
25 the authorities of the Secretary to reduce agri-

1 cultural and related sources of nonpoint source
2 pollution in a manner consistent with subtitle D
3 of title XII of the Food Security Act of 1985
4 (16 U.S.C. 3830 et seq.).

5 “(B) IDENTIFICATION OF LANDS.—Not
6 later than 1 year after the date of enactment of
7 this paragraph, and annually thereafter, the
8 Administrator shall identify, on the basis of the
9 assessment reports submitted by the States and
10 approved by the Administrator under subsection
11 (a) (or developed by the Administrator for the
12 States pursuant to subsections (a), (d), and (e))
13 and such other information as is available to
14 the Administrator, those lands that, if enrolled
15 in the conservation reserve program of the De-
16 partment of Agriculture, would contribute to
17 the protection of the environment by reducing
18 nonpoint source pollution. If appropriate, the
19 lands identified may include lands that are not
20 erodible but that pose an off-farm environ-
21 mental threat, as determined pursuant to sec-
22 tion 1231(c)(2) of the Food Security Act of
23 1985 (16 U.S.C. 3831(c)(2)).

24 “(C) PROVISION OF LIST TO SECRETARY
25 OF AGRICULTURE.—The Administrator shall

1 furnish the list of the lands identified pursuant
 2 to subparagraph (B) to the Secretary of Agri-
 3 culture to assist the Secretary in establishing
 4 priorities for expenditures under the conserva-
 5 tion reserve program and shall make the list
 6 available to the States and to the public.

7 “(D) RESPONSE TO LIST.—Not later than
 8 180 days after receiving the list referred to in
 9 subparagraph (C), the Secretary shall provide
 10 the Administrator with a report that describes
 11 the actions the Secretary will take to respond to
 12 the list. The Secretary shall provide a detailed
 13 explanation of any recommendation of the Ad-
 14 ministrator that the Secretary will not imple-
 15 ment.”.

16 (3) FEDERAL LANDS AND HIGHWAYS.—Sub-
 17 section (l) of section 319 (33 U.S.C. 1329(l)) is
 18 amended to read as follows:

19 “(l) FEDERAL LANDS AND HIGHWAYS.—

20 “(1) FEDERAL LANDS.—

21 “(A) IN GENERAL.—The President shall
 22 direct the heads of appropriate Federal agencies
 23 that own or manage land to implement regula-
 24 tions that shall take effect not later than the
 25 date of enactment of this paragraph, to ensure

1 the implementation of appropriate measures to
2 control nonpoint sources of water pollution, in-
3 cluding, at a minimum—

4 “(i) management measures identified
5 pursuant to subsection (c) for new sources;
6 and

7 “(ii) for a watershed area of a water
8 identified pursuant to subsection (a), the
9 implementation of management measures
10 identified pursuant to subsection (c) or the
11 implementation of a site-specific water
12 quality plan pursuant to subsection (f).

13 “(B) SCHEDULES; EFFECTIVE DATE.—

14 “(i) SCHEDULES.—Each schedule for
15 the development of management measures
16 and site-specific water quality plans, and
17 each schedule for the implementation of
18 the measures or plans, shall be consistent
19 with any schedule established by a State
20 under a program established by the State
21 pursuant to subsection (b).

22 “(ii) EFFECTIVE DATE.—The require-
23 ments of this paragraph shall take effect
24 on a date specified by the President, but

1 not later than 3 years after the date of en-
2 actment of this paragraph.

3 “(C) AUTHORITIES.—Any license, permit,
4 contract, special use permit, lease, agreement,
5 claim, or related operational authority between
6 a Federal agency and any person authorizing
7 activities on Federal lands in effect on the day
8 before the date specified in subparagraph
9 (B)(ii) may remain in effect for the term of the
10 authority or a period of 5 years (beginning on
11 the date specified in subparagraph (B)(ii)),
12 whichever is less.

13 “(D) STATUTORY CONSTRUCTION.—Noth-
14 ing in this paragraph is intended to limit or
15 constrain the authority of a State or the Ad-
16 ministrator to require the implementation of
17 such additional controls over nonpoint sources
18 of pollution on Federal lands as may be nec-
19 essary to attain and maintain standards adopt-
20 ed pursuant to section 303 or other require-
21 ments of this Act.

22 “(2) HIGHWAY CONSTRUCTION.—

23 “(A) IN GENERAL.—The Administrator, in
24 cooperation with the Secretary of Transpor-
25 tation, shall develop measures and practices to

1 prevent water pollution resulting from highway
2 construction and promote the implementation of
3 the measures and practices.

4 “(B) CERTAIN PROJECTS.—The guidelines
5 developed by the Secretary of Transportation
6 pursuant to section 1057 of the Intermodal
7 Surface Transportation Efficiency Act of 1991
8 (Public Law 102–240; 105 Stat. 2002) shall, at
9 a minimum, require the implementation of man-
10 agement measures specified under subsection
11 (c) in the case of any construction project fund-
12 ed in whole or in part under title I of such Act.
13 The Secretary shall withhold funds for any
14 project referred to in the preceding sentence
15 unless the Secretary determines that the project
16 will comply with the guidelines.”.

17 (e) ANIMAL WASTE MANAGEMENT FACILITIES.—
18 Section 319 (33 U.S.C. 1329) is amended by adding at
19 the end the following new subsection:

20 “(o) ANIMAL WASTE MANAGEMENT FACILITIES.—

21 “(1) IN GENERAL.—Not later than 2 years
22 after the date of enactment of this paragraph, the
23 Administrator, in consultation with the Secretary of
24 Agriculture, shall publish guidelines for the design of

1 animal waste management facilities. The guidelines
2 shall include—

3 “(A) general standards concerning the
4 proper design of facilities;

5 “(B) minimum elements of plans for con-
6 struction of facilities at a specific site;

7 “(C) specifications concerning minimum
8 construction standards; and

9 “(D) such other requirements and informa-
10 tion as, in the judgment of the Administrator,
11 are necessary and appropriate.

12 “(2) PLAN.—Any person may submit to the
13 Administrator (or in the case of a State with a plan
14 approved by the Administrator under subsection (d),
15 the State) a plan for the construction of an animal
16 waste management facility. Each plan shall—

17 “(A) be consistent with the guidelines de-
18 veloped pursuant to paragraph (1) and sub-
19 section (c); and

20 “(B) include an estimate of the total cost
21 for the construction of the facility.

22 “(3) PLAN APPROVAL.—The Administrator,
23 with the concurrence of the Secretary of Agriculture,
24 shall review and approve or disapprove any plan for
25 the construction of an animal waste management fa-

1 cility submitted pursuant to this subsection. Upon
2 approval of a plan, the facility shall be eligible for
3 assistance under title VI.

4 “(4) TECHNICAL ASSISTANCE.—The Secretary
5 of Agriculture may provide technical assistance to
6 persons concerning the design of animal waste man-
7 agement facilities. The assistance may include the
8 design of facilities to account for site-specific condi-
9 tions and the integration of the facilities into related
10 agricultural activities.

11 “(5) DEFINITION.—As used in this subsection,
12 the term ‘animal waste management facility’ means
13 a facility for the storage, treatment, or disposal of
14 animal waste.”.

15 (f) SUBSURFACE SEWAGE DISPOSAL.—Section 319
16 (33 U.S.C. 1329), as amended by subsection (e), is further
17 amended by adding at the end the following new sub-
18 section:

19 “(p) SUBSURFACE SEWAGE DISPOSAL.—

20 “(1) IN GENERAL.—Not later than 2 years
21 after the date of enactment of this subsection, the
22 Administrator shall publish guidelines for the design,
23 operation, and management of publicly owned sub-
24 surface sewage organizations.

1 “(2) OPERATION AND MANAGEMENT STAND-
2 ARDS.—The guidelines published pursuant to this
3 subsection shall provide such standards of operation
4 and management as the Administrator determines to
5 be necessary to ensure that subsurface sewage dis-
6 posal units operated by an organization referred to
7 in paragraph (1) will provide treatment adequate to
8 protect water quality .

9 “(3) CONTENTS OF GUIDELINES.—At a mini-
10 mum, the guidelines published pursuant to this sub-
11 section shall—

12 “(A) specify standards for the design and
13 location of new subsurface sewage disposal sys-
14 tems;

15 “(B) specify maintenance requirements
16 and schedules for existing systems (existing at
17 the time of publication of the guidelines);

18 “(C) establish financial management and
19 control practices, including a requirement for a
20 user charge sufficient to ensure the effective op-
21 eration of each system;

22 “(D) require appropriate provision for
23 management or disposal of waste material for
24 systems; and

1 “(E) address such other matters as the
2 Administrator determines to be appropriate.

3 “(4) PLAN.—Beginning on the date that is 2
4 years after the date of enactment of this subsection,
5 any person may submit to the Administrator (or in
6 the case of a State with a plan approved under sub-
7 section (d), the State) a plan for the establishment
8 of a subsurface sewage disposal organization pursu-
9 ant to this subsection.

10 “(5) APPROVAL OF PLAN.—The Administrator,
11 with the concurrence of the State, shall approve the
12 plan if the Administrator determines that the plan
13 meets the requirements of this subsection. Upon ap-
14 proval of the plan, the organization shall be eligible
15 for assistance pursuant to title VI.”.

16 (g) STATE WATER LAW.—Section 319 (33 U.S.C.
17 1329), as amended by subsection (f), is further amended
18 by adding at the end the following new subsection:

19 “(q) STATE WATER LAW.—Nothing in this section
20 is intended to supersede, abrogate, or otherwise impair the
21 right of any State to allocate quantity of water within the
22 State.”.

1 **TITLE IV—MUNICIPAL**
2 **POLLUTION CONTROL**

3 **SEC. 401. COMBINED SEWER OVERFLOWS.**

4 Section 402 (33 U.S.C. 1342), as amended by section
5 205(b), is further amended by adding at the end the fol-
6 lowing new subsection:

7 “(r) COMBINED SEWER OVERFLOWS.—

8 “(1) REQUIREMENT FOR PERMITS.—Each per-
9 mit issued pursuant to this section for a discharge
10 from a combined storm and sanitary sewer shall con-
11 form with the combined sewer overflow control policy
12 published by the Administrator at 58 Fed. Reg.
13 4994 (January 19, 1993).

14 “(2) TERM OF PERMIT.—Notwithstanding any
15 compliance schedule under section 301(b), or any
16 permit limitation under section 402(b)(1)(B), the
17 Administrator may issue a permit pursuant to this
18 section for a discharge from a combined storm and
19 sanitary sewer, that includes a schedule for compli-
20 ance with a long-term control plan under the control
21 policy referred to in paragraph (1) for a term not
22 to exceed 15 years. Notwithstanding the compliance
23 deadline specified in the preceding sentence, the Ad-
24 ministrator may, on request of an owner or operator
25 of a combined storm and sanitary sewer, extend the

1 period of compliance beyond the date specified if the
2 Administrator determines that compliance by the
3 date is not within the economic capability of the
4 owner or operator, or if the Administrator deter-
5 mines that an extension is otherwise appropriate.

6 “(3) BACTERIA.—A permitting authority may
7 not issue a permit under paragraph (2) unless, after
8 the date of enactment of this subsection—

9 “(A) the Administrator has reviewed and
10 approved the water quality standards for bac-
11 teria adopted by the State in which the dis-
12 charger is located; or

13 “(B) the criteria are published in the water
14 quality criteria for bacteria published by the
15 Administrator as described in 51 Fed. Reg.
16 8012 (March 7, 1986).”.

17 **SEC. 402. STORMWATER MANAGEMENT.**

18 Section 402(p) (33 U.S.C. 1342(p)) is amended—

19 (1) by striking paragraph (1);

20 (2) by redesignating paragraph (2) as para-
21 graph (1);

22 (3) in paragraph (1) (as so redesignated)—

23 (A) by striking the matter preceding sub-
24 paragraph (A) and inserting the following:

1 “(1) IN GENERAL.—A permit issued under this
2 section shall be required for each of the following
3 discharges composed entirely of stormwater.”; and

4 (B) by adding at the end the following new
5 subparagraph:

6 “(F) A discharge from a municipal sepa-
7 rate storm sewer system serving a population of
8 fewer than 100,000 individuals covered by a
9 permit issued under subparagraph (C) or (D)
10 that is located in an urbanized area (as des-
11 ignated by the Bureau of the Census of the De-
12 partment of Commerce), except that the re-
13 quirements of this subparagraph shall apply be-
14 ginning on the date of the first reissuance of a
15 permit for a discharge under subparagraph (C)
16 or (D) for the same urbanized area that occurs
17 after the date that is 3 years after the date of
18 enactment of this subparagraph.”;

19 (4) by inserting after paragraph (1) (as so re-
20 designated) the following new paragraph:

21 “(2) OTHER STORMWATER DISCHARGES.—Ex-
22 cept as provided in paragraph (1)(E), the Adminis-
23 trator (or the State, in the case of a State with the
24 authority to issue permits under this section) may

1 not require a permit under this section for a dis-
2 charge composed entirely of stormwater if—

3 “(A) the discharge is from a municipal
4 separate storm sewer system serving a popu-
5 lation of fewer than 100,000 individuals that is
6 not located in an urbanized area (as designated
7 by the Bureau of the Census of the Department
8 of Commerce) covered by a permit issued under
9 subparagraph (C) or (D) of paragraph (1);

10 “(B) the discharge is from a construction
11 activity that disturbs an area of less than 5
12 acres, except that a discharge from a construc-
13 tion activity that disturbs an area of greater
14 than 1 acre and less than 5 acres in an urban-
15 ized area (as designated by the Bureau of the
16 Census of the Department of Commerce) sub-
17 ject to permit requirements under subparagraph
18 (C), (D), or (F) of paragraph (1) shall be re-
19 quired to have a permit if a State or local
20 stormwater management program does not im-
21 pose controls on the discharge; or

22 “(C) the discharge is from a gasoline sta-
23 tion, except that a discharge from a gasoline
24 station in an urbanized area (as designated by
25 the Bureau of the Census of the Department of

1 Commerce) subject to permit requirements
2 under subparagraph (C), (D), or (F) of para-
3 graph (1) shall be required to have a permit if
4 a State or local stormwater management pro-
5 gram does not impose controls on the dis-
6 charge.”;

7 (5) in paragraph (3), by adding at the end the
8 following new subparagraph:

9 “(C) MAXIMUM EXTENT PRACTICABLE DE-
10 FINED.—

11 “(i) IN GENERAL.—For the purposes
12 of subparagraph (B)(iii) and permits is-
13 sued not later than 2 years after the date
14 of enactment of this subparagraph, the
15 term ‘maximum extent practicable’ means
16 applying management measures, as defined
17 in section 6217(g)(5) of the Coastal Zone
18 Act Reauthorization Amendments of 1990
19 (16 U.S.C. 1455b(g)(5)), in the manner
20 prescribed in guidance issued pursuant to
21 such section.

22 “(ii) EXPANDED DEFINITION.—For
23 the purposes specified in clause (i), after
24 the date that is 2 years after the date of
25 enactment of this subparagraph, the term

1 ‘maximum extent practicable’ has the
2 meaning provided in clause (i), except that
3 the term also includes applying other ap-
4 propriate management measures in a man-
5 ner prescribed by the Administrator in
6 guidance. The Administrator shall issue
7 the guidance not later than 2 years after
8 the date of enactment of this subpara-
9 graph.”;

10 (6) in paragraph (4), by striking “(2)” each
11 place it appears and inserting “(1)”; and

12 (7) by striking paragraphs (5) and (6) and in-
13 serting the following new paragraphs:

14 “(5) MONITORING AND REPORTING REQUIRE-
15 MENTS.—Each municipality subject to the require-
16 ments of this subsection shall be subject to—

17 “(A) monitoring requirements for the qual-
18 ity of receiving waters; and

19 “(B) reporting requirements for the imple-
20 mentation of management measures.

21 “(6) REVISED MUNICIPAL PERMITS.—

22 “(A) IN GENERAL.—Not later than 5 years
23 after the initial date of issuance of a permit
24 under paragraph (4), the Administrator (or the
25 State, in the case of a State with the authority

1 to issue permits under this section) shall review
2 each permit issued under such paragraph and
3 include in each reissued permit management
4 measures that ensure the attainment and main-
5 tenance of water quality standards and the re-
6 quirements of the guidance referred to in para-
7 graph (3)(C).

8 “(B) WAIVER.—With respect to a permit
9 issued under this paragraph, during the term of
10 the permit, the Administrator may not require
11 compliance with a numeric effluent limitation or
12 a water quality standard.

13 “(7) DELAYED COMPLIANCE.—During the 10-
14 year period beginning on the date of enactment of
15 this paragraph, the Administrator (or the State, in
16 the case of a State with the authority to issue per-
17 mits under this section) may not require, in a permit
18 issued under this subsection, compliance with a
19 numeric effluent limitation or a water quality stand-
20 ard directly, except as reflected in management
21 measures required under paragraph (6)(A).

22 “(8) NATIONAL SOURCE CONTROLS.—

23 “(A) IN GENERAL.—The Administrator
24 shall—

1 “(i) identify and assess the relative
2 degree of contribution of pollutants to
3 stormwater from various sources (including
4 household products, motor vehicles, and
5 other sources); and

6 “(ii) assess the availability and cost of
7 alternatives and substitutes for the pollut-
8 ants identified pursuant to clause (i).

9 “(B) SUBSTITUTIONS OR REDUCTIONS.—
10 In any case in which the Administrator deter-
11 mines that—

12 “(i) a pollutant found in stormwater
13 causes or contributes to a significant im-
14 pairment in water quality or a significant
15 violation of water quality standards as a
16 result of a discharge of the pollutant in
17 stormwater; and

18 “(ii) a reasonably available and eco-
19 nomically achievable alternative or sub-
20 stitute to the pollutant, or the source asso-
21 ciated with the pollutant, is available,
22 the Administrator may, by regulation, require
23 each manufacturer of the pollutant or source of
24 the pollutant to implement a phased substi-
25 tution or reduction in the manufacture of the

1 pollutant or source in accordance with a sched-
2 ule that takes into account the cost of the sub-
3 stitution or reduction.

4 “(C) REPORT.—Not later than 2 years
5 after the date of enactment of this paragraph,
6 and biennially thereafter, the Administrator
7 shall submit a report to Congress that describes
8 the implementation of this paragraph.”.

9 **SEC. 403. WATER CONSERVATION.**

10 Section 113 (33 U.S.C. 1263) is amended to read as
11 follows:

12 **“SEC. 113. WATER CONSERVATION.**

13 **“(a) INTERGOVERNMENTAL COORDINATION.—**

14 **“(1) IN GENERAL.—**The Environmental Protec-
15 tion Agency shall be the primary coordinator for all
16 policies of the Federal Government related to munic-
17 ipal, commercial, residential, and industrial water
18 conservation.

19 **“(2) CONSULTATION WITH AGENCY HEADS.—**

20 To carry out this section, the Secretary of the Army,
21 acting through the Chief of Engineers of the Army
22 Corps of Engineers, shall, to the greatest extent
23 practicable, consult with the heads of other Federal
24 agencies that participate in water resource planning,
25 development, and management.

1 “(3) CONSULTATION WITH OTHER OFFI-
2 CIALS.—To carry out this section, the Secretary of
3 the Army, acting through the Chief of Engineers of
4 the Army Corps of Engineers, shall, to the greatest
5 extent practicable, consult with appropriate officials
6 of State and local governments, educational institu-
7 tions, trade associations, scientific organizations,
8 businesses, and other organizations with expertise
9 and experience with respect to water conservation.

10 “(b) TECHNICAL ASSISTANCE TO STATES AND MU-
11 NICIPALITIES.—

12 “(1) IN GENERAL.—The Secretary of the Army,
13 acting through the Chief of Engineers of the Army
14 Corps of Engineers, acting alone or through a con-
15 tracting party, is authorized to provide technical as-
16 sistance to States, public and private water utilities,
17 local governmental entities, and other appropriate
18 public agencies and authorities with respect to—

19 “(A) conducting a promotional and edu-
20 cational campaign to encourage consumers to
21 use water more efficiently;

22 “(B) implementing financial or other in-
23 centives for users of water to conserve water,
24 including universal metering of water users and

1 the reform of water rates to promote conserva-
2 tion;

3 “(C) detecting and correcting leaks in
4 water distribution and collection systems;

5 “(D) promoting, distributing, and install-
6 ing water-saving technologies, fixtures, or
7 equipment for users of water;

8 “(E) incorporating water-saving tech-
9 nologies into building codes and standards;

10 “(F) establishing coordinated regional
11 management of water and sewer systems;

12 “(G) auditing water use;

13 “(H) reclaiming, recycling, and reusing
14 wastewater;

15 “(I) promoting water-efficient vegetative
16 cover and landscaping; and

17 “(J) otherwise achieving beneficial reduc-
18 tions in water use or water loss.

19 “(2) DUTIES OF THE SECRETARY OF THE
20 ARMY.—

21 “(A) IN GENERAL.—The Secretary of the
22 Army, acting through the Chief of Engineers of
23 the Army Corps of Engineers, shall, on a regu-
24 lar basis, make available information to poten-
25 tial recipients of the assistance referred to in

1 paragraph (1) concerning the programs, offer-
2 ings, and activities of Federal agencies with re-
3 spect to water conservation.

4 “(B) CONSULTATION.—In order to better
5 target limited resources to potential recipients,
6 the Secretary of the Army, acting through the
7 Chief of Engineers of the Army Corps of Engi-
8 neers, shall consult, on a regular basis, with the
9 heads of other Federal water resources develop-
10 ment agencies to determine which States, areas,
11 water utilities, and municipalities are experienc-
12 ing water capacity shortfalls or will likely expe-
13 rience the shortfalls.

14 “(3) MODEL WATER CONSERVATION PRO-
15 GRAMS.—The Secretary of the Army, acting through
16 the Chief of Engineers of the Army Corps of Engi-
17 neers, shall develop, update, maintain, and dissemi-
18 nate a series of model water conservation programs
19 for States, water utilities, and municipalities.

20 “(4) REQUESTS FOR STUDY.—

21 “(A) IN GENERAL.—Any water utility or
22 municipality may request the Secretary of the
23 Army, acting through the Chief of Engineers of
24 the Army Corps of Engineers, to—

1 “(i) undertake a study of the feasibility,
2 impacts, costs, and benefits of then
3 current and potential water conservation
4 activities; and

5 “(ii) recommend actions for beneficial
6 reductions in water use or loss.

7 “(B) PRIORITIES.—The Secretary of the
8 Army, acting through the Chief of Engineers of
9 the Army Corps of Engineers, shall give priority
10 to the water conservation studies referred to in
11 subparagraph (A) on the basis of the potential
12 for—

13 “(i) protection of the environment;
14 and

15 “(ii) reducing costs to Federal, State,
16 and local governments for water supply
17 and wastewater treatment facilities.

18 “(C) AMOUNT OF ASSISTANCE.—The
19 amount of Federal funds for a water conserva-
20 tion study under this subsection of any State,
21 water utility, or municipality serving more than
22 5,000 individuals shall be not less than 50 per-
23 cent of the cost of the study. The Secretary of
24 the Army, acting through the Chief of Engi-
25 neers of the Army Corps of Engineers, may

1 waive the 50 percent matching requirement for
2 a water utility or municipality that serves a
3 population of fewer than 5,000 individuals.

4 “(5) REVIEWS.—

5 “(A) IN GENERAL.—The Secretary of the
6 Army, acting through the Chief of Engineers of
7 the Army Corps of Engineers, shall collect in-
8 formation concerning water conservation
9 projects, including projects assisted under para-
10 graph (4), and make the information widely
11 available to the public in a timely manner.

12 “(B) REQUIREMENTS FOR REVIEWS.—The
13 reviews shall—

14 “(i) evaluate the effectiveness of var-
15 ious water conservation measures; and

16 “(ii) provide information to assist the
17 Secretary in providing technical assistance.

18 “(c) TECHNICAL ASSISTANCE TO BUSINESSES AND
19 INSTITUTIONS.—The Secretary of the Army, acting
20 through the Chief of Engineers of the Army Corps of En-
21 gineers, may provide assistance that is comparable to the
22 assistance provided under subsection (b) to businesses and
23 other persons. The Federal cost of the assistance shall be
24 fully reimbursed by the recipient of the assistance.

1 “(d) NATIONAL CLEARINGHOUSE ON WATER CON-
2 SERVATION.—

3 “(1) IN GENERAL.—The Administrator shall es-
4 tablish a national clearinghouse on water conserva-
5 tion (referred to in this subsection as the ‘clearing-
6 house’) to—

7 “(A) collect, analyze, and disseminate in-
8 formation on water conservation technologies
9 and practices; and

10 “(B) promote the widespread adoption of
11 the technologies and practices referred to in
12 subparagraph (A) by public and private water
13 utilities, and commercial, industrial, and resi-
14 dential consumers.

15 “(2) REQUIREMENTS FOR INFORMATION.—The
16 information referred to in paragraph (1) shall in-
17 clude information referred to in, and information ob-
18 tained under, subsections (b) and (c).

19 “(3) COLLECTION OF INFORMATION.—The
20 clearinghouse shall collect reliable water conservation
21 information. On request, the Administrator shall
22 provide the information to Federal agencies, States,
23 local governments, other appropriate public agencies
24 and authorities, nonprofit institutions and organiza-
25 tions, businesses and industries, researchers, private

1 individuals, and other persons and entities in a posi-
 2 tion to derive or increase the public benefits offered
 3 by the technologies, methods, and practices related
 4 to water conservation described in this subsection.

5 “(e) AUTHORIZATION OF APPROPRIATIONS.—There
 6 are authorized to be appropriated to carry out this section
 7 an amount not to exceed \$10,000,000 for each of fiscal
 8 years 1994 through 2000, of which not less than \$500,000
 9 for each fiscal year are authorized to be appropriated to
 10 the Environmental Protection Agency to carry out sub-
 11 section (d).”.

12 **TITLE V—PERMIT PROGRAM** 13 **AND ENFORCEMENT**

14 **SEC. 501. PERMIT FEES.**

15 (a) IN GENERAL.—Section 402 (33 U.S.C. 1342), as
 16 amended by section 401, is further amended by adding
 17 at the end the following new subsection:

18 “(s) PERMIT FEES.—

19 “(1) IN GENERAL.—

20 “(A) MODIFICATION.—

21 “(i) IN GENERAL.—Not later than 2
 22 years after the date of enactment of this
 23 subsection, or the applicable date specified
 24 in clause (ii), the Governor of each State
 25 that administers a permit program under

1 subsection (b) shall submit to the Adminis-
2 trator, for approval, a modification of the
3 permit program of the State that includes
4 a requirement under State law that—

5 “(I) the owner or operator of cer-
6 tain point sources (as determined by
7 the State) subject to the requirement
8 to obtain a permit under this section
9 or a permit for the disposal of sewage
10 sludge under section 405; and

11 “(II) an industrial user of a pub-
12 licly owned treatment works subject to
13 a Federal or State permit, or equiva-
14 lent individual control mechanism,
15 concerning the pretreatment of toxic
16 or nonconventional pollutants for in-
17 troduction into the treatment works,
18 pay an annual fee (or the equivalent, over
19 another specified period of time).

20 “(ii) EXTENSION.—If a State has a
21 legislature that is not scheduled to meet in
22 a legislative session in which legislation to
23 carry out this subparagraph may be en-
24 acted by the date specified in clause (i),
25 the State shall carry out the requirements

1 of clause (i) not later than the date of ad-
2 journeyment of the first regular legislative
3 session of a State in which legislation to
4 carry out this subsection may be consid-
5 ered.

6 “(B) ACCUMULATED AMOUNT OF FEES.—
7 The total amount collected as fees for any year
8 in a State shall be a sufficient amount to cover
9 not less than 60 percent of the costs of develop-
10 ing and administering point source elements of
11 the water quality program, and the costs of de-
12 veloping and administering sewage sludge dis-
13 posal and pretreatment programs, of the State,
14 including the costs of—

15 “(i) reviewing and acting upon appli-
16 cations for permits;

17 “(ii) implementing and enforcing the
18 terms and conditions of permits or equiva-
19 lent individual control mechanisms (exclud-
20 ing any court costs);

21 “(iii) effluent and ambient water qual-
22 ity monitoring;

23 “(iv) preparing generally applicable
24 regulations or guidance, including water
25 quality standards;

1 “(v) modeling, planning, analyses, and
2 demonstrations;

3 “(vi) preparing and maintaining pub-
4 lic information systems concerning effluent
5 limitations, discharges, compliance, and
6 water quality; and

7 “(vii) evaluating the performance of
8 laboratories that analyze monitoring sam-
9 ples (including laboratory inspections, lab-
10 oratory audits, and quality assurance).

11 “(2) USE OF FEES.—

12 “(A) IN GENERAL.—Each fee required to
13 be collected by a State under this subsection
14 shall be used only to support the water quality
15 programs of the State.

16 “(B) RESTRICTION ON USE.—Except as
17 provided in subparagraph (C), the fees collected
18 pursuant to this subsection may not be used to
19 provide State matching funds for Federal funds
20 made available to the State pursuant to section
21 106.

22 “(C) USE FOR MATCHING FUNDS.—A
23 State may use any amount collected by the
24 State as fees pursuant to this subsection in ex-
25 cess of the minimum amount specified in para-

1 graph (1)(B) to provide matching funds for
2 Federal funds made available to the State pur-
3 suant to section 106.

4 “(3) FEDERAL FEE PROGRAM.—

5 “(A) FEDERAL PROGRAM OF FEE ASSESS-
6 MENT.—Not later than 3 years after the date
7 of enactment of this subsection, the Adminis-
8 trator shall establish a Federal program for the
9 collection of fees under this subsection.

10 “(B) CONDITIONS THAT REQUIRE IMPLI-
11 MENTATION OF FEDERAL PROGRAM.—If the
12 Administrator, upon review of the permit modi-
13 fications submitted by a State pursuant to
14 paragraph (1), or upon conducting a subse-
15 quent review pursuant to subparagraph (C), de-
16 termines that—

17 “(i) the fee provisions under the modi-
18 fied permit program submitted by a State
19 to the Administrator for approval pursuant
20 to paragraph (1) do not meet the require-
21 ments of this subsection;

22 “(ii) a State is not adequately admin-
23 istering or enforcing a fee system referred
24 to in paragraph (1) that has been approved
25 by the Administrator; or

1 “(iii) a State does not have the au-
2 thority to administer a permit program
3 pursuant to subsection (b),
4 the Administrator shall, not later than 3 years
5 after the date of enactment of this subsection,
6 or with respect to a finding described in clause
7 (ii) not later than 180 days after making the
8 finding, assess and collect fees from sources re-
9 ferred to in paragraph (1) pursuant to the pro-
10 gram referred to in subparagraph (A).

11 “(C) REVIEW BY ADMINISTRATOR.—The
12 Administrator may, at any time after approving
13 the modifications of the permit program of a
14 State under paragraph (1), review the fees as-
15 sessed by the State pursuant to the modifica-
16 tions. The Administrator shall review the fees
17 assessed by the State not later than 5 years
18 after the date of approval of the modifications,
19 and not less frequently than every 5 years
20 thereafter.

21 “(D) SUBSEQUENT ESTABLISHMENT OF
22 STATE PROGRAM.—At any time after the Ad-
23 ministrator implements a program to assess
24 fees pursuant to subparagraph (A), if the Ad-
25 ministrator determines that a State program to

1 assess fees meets the requirements of this sub-
2 section and the State has adequate authority to
3 assess the fees, the Administrator may approve
4 the State program and terminate the applica-
5 tion of the Federal program to the State.

6 “(E) FEDERAL WATER POLLUTION CON-
7 TROL PERMIT FUND.—

8 “(i) ESTABLISHMENT.—There is es-
9 tablished in the United States Treasury a
10 Federal Water Pollution Control Permit
11 Fund (referred to in this subparagraph as
12 the ‘Fund’).

13 “(ii) SOURCE AND USE.—All fees col-
14 lected by the Administrator (plus any
15 amount of interest and penalty collected by
16 the Administrator pursuant to section
17 309(g)) and any interest earned from the
18 investment of the Fund shall be deposited
19 in the Fund, and shall be available, with-
20 out fiscal limitation, to carry out the ac-
21 tivities for which the fees are collected (as
22 described in paragraph (1)(B)).

23 “(iii) INVESTMENT OF FUND.—It
24 shall be the duty of the Secretary of the
25 Treasury to invest such portion of the

1 Fund as the Secretary determines is not
2 required to meet the then current with-
3 draws of the Fund. The investment may
4 be made only in interest-bearing obliga-
5 tions of the United States or in obligations
6 guaranteed as to both principal and inter-
7 est by the United States. For the purpose
8 referred to in the preceding sentence, the
9 obligations may be acquired—

10 “(I) on original issue at the issue
11 price; or

12 “(II) by purchase of outstanding
13 obligations at the market price.

14 “(iv) PAYMENTS FROM FUND.—The
15 Secretary of the Treasury is authorized
16 and directed to pay out of any funds avail-
17 able in the Fund any expenses incurred by
18 the Federal Government in carrying out
19 the activities specified in clause (ii). None
20 of the funds deposited into the Fund shall
21 be available for any purpose other than
22 making payments authorized under the
23 preceding sentence.”.

1 (b) PENALTIES.—Section 309(g) (33 U.S.C.
 2 1319(g)) is amended by adding at the end the following
 3 new paragraph:

4 “(12) OTHER PENALTIES.—Any point source
 5 that fails to pay a fee lawfully imposed by the Ad-
 6 ministrator under section 402(s) shall be liable to
 7 the United States for payment of an amount equal
 8 to the sum of—

9 “(A) the amount of the fee;

10 “(B) a penalty in an amount equal to 50
 11 percent of the amount of the fee; and

12 “(C) interest on the amount of the fee
 13 computed in accordance with section 6621(a)(2)
 14 of the Internal Revenue Code of 1986.”.

15 **SEC. 502. PERMIT PROGRAM MODIFICATIONS.**

16 (a) PERMIT MANAGEMENT.—

17 (1) IN GENERAL.—Section 402(b) (33 U.S.C.
 18 1342(b)) is amended by adding at the end the fol-
 19 lowing new paragraphs:

20 “(10) To ensure that, beginning on the date that is
 21 1 year after the date of enactment of this paragraph, in
 22 the case of a new discharge into navigable waters resulting
 23 from the construction of a new facility, the applicant ap-
 24 plies for a permit under this section prior to the com-
 25 mencement of construction of the facility.

1 “(11) To ensure that each person issued a permit
2 under this section who has received assistance under sec-
3 tion 201(g)(1) or section 603(c)(1) is in compliance with
4 the requirements of section 204(b).”.

5 (2) SYSTEM OF CHARGES.—The first sentence
6 of section 204(b)(1) (33 U.S.C. 1284(b)(1)) is
7 amended by striking “the Administrator shall not
8 approve any grant for any treatment works under
9 section 201(g)(1) after March 1, 1973, unless he
10 shall first have determined that the applicant (A)
11 has adopted or will adopt” and inserting “the Ad-
12 ministrator may not approve a grant for any recipi-
13 ent of assistance under section 201(g)(1) or
14 603(c)(1)(A) unless the applicant (A) has adopted or
15 will adopt”.

16 (b) PERMIT REVISION AND RENEWAL.—Section
17 402(b)(1)(C) (33 U.S.C. 1342(b)(1)(C)) is amended—

18 (1) in clause (iii), by adding “and” at the end;
19 and

20 (2) by adding at the end the following new
21 clause:

22 “(iv) the promulgation, after the date of is-
23 suance of the permit, of any new or revised ef-
24 fluent guideline or standard pursuant to section
25 303, or any applicable regulation;”.

1 (c) FEDERAL PROGRAM OVERSIGHT.—Section
2 402(d) (33 U.S.C. 1342(d)) is amended—

3 (1) in paragraph (4)—

4 (A) by striking “on request of the State,”
5 and all that follows through “If” and inserting
6 “and if”;

7 (B) by striking “within 30 days” and all
8 that follows through “of such objection” and in-
9 serting “within 180 days after such objection”;
10 and

11 (C) by adding at the end the following new
12 sentence: “In any case in which the Adminis-
13 trator exercises waiver authority, the Adminis-
14 trator shall make reasonable efforts to periodi-
15 cally review the waiver.”; and

16 (2) by adding at the end the following new
17 paragraphs:

18 “(5) In any case in which the appropriate official of
19 a State permit program approved by the Administrator
20 pursuant to subsection (b) fails, during the 180-day period
21 beginning on the date of expiration of a permit for a dis-
22 charge, to propose to reissue a permit for the discharge,
23 the Administrator may issue a permit for the discharge.

24 “(6) The Administrator may, by regulation require
25 that each permit issued be reviewed and revised to include

1 an effluent limitation based on a new or revised effluent
2 guideline or standard, or any other applicable regulation.”.

3 (d) JUDICIAL REVIEW.—

4 (1) IN GENERAL.—Section 402(b)(3) (33
5 U.S.C. 1342(b)(3)) is amended by striking the semi-
6 colon at the end and inserting “and an opportunity
7 for judicial review of a final permit action under this
8 section in a State court by the applicant, any person
9 who participated in the public comment process, and
10 any other person who could obtain judicial review of
11 the action under any applicable law;”.

12 (2) SANCTION.—Section 402(d), as amended by
13 subsection (c)(2), is further amended by adding at
14 the end the following new paragraph:

15 “(7) If a State with a program approved under sub-
16 section (b) fails to modify a State program pursuant to
17 the requirements of subsection (b)(3) by the date that is
18 3 years after the date of enactment of this paragraph, the
19 Administrator shall withhold an amount equal to 10 per-
20 cent of the amount that would otherwise be allotted to the
21 State under section 106 for the fiscal year that begins
22 after the decision of the Administrator to withhold the
23 amount.”.

24 (e) BIOLOGICAL ASSESSMENT.—

1 (1) IN GENERAL.—Subsection (e) of section
2 402 (33 U.S.C. 1342(e)) is amended to read as fol-
3 lows:

4 “(e)(1)(A) The Administrator may, in cooperation
5 with the Governor of a State and in cooperation with the
6 heads of the United States Fish and Wildlife Service of
7 the Department of the Interior and the National Marine
8 Fisheries Service of the Department of Commerce, iden-
9 tify sensitive aquatic systems in the State that support
10 valuable biological resources, including threatened or en-
11 dangered species.

12 “(B) The Administrator shall publish a description
13 of the areas identified pursuant to subparagraph (A) in
14 the Federal Register.

15 “(2) Beginning on the date that is 1 year after the
16 date of enactment of this paragraph, before a final permit
17 under this section may be issued for a discharge to waters
18 identified pursuant to paragraph (1), the head of—

19 “(A) the United States Fish and Wildlife Serv-
20 ice of the Department of the Interior; or

21 “(B) the National Marine Fisheries Service of
22 the Department of Commerce,

23 whichever is appropriate, shall be required to review and
24 comment on a draft permit prepared pursuant to this sub-
25 section not later than 30 days after receipt of the draft

1 permit. The Administrator shall promulgate such regula-
2 tions as are necessary to carry out this paragraph.”.

3 (2) BIOLOGICAL DISCHARGE CRITERIA.—Sec-
4 tion 403 (33 U.S.C. 1343) is amended—

5 (A) by striking the section heading and in-
6 serting the following new heading:

7 “BIOLOGICAL DISCHARGE CRITERIA”;

8 (B) by striking subsection (a) and insert-
9 ing the following new subsection:

10 “(a) No permit shall be issued under section 402 for
11 a discharge into the territorial sea, the waters of the con-
12 tiguous zone, the oceans, or any waters identified pursu-
13 ant to section 402(e)(1)(A) if, on the basis of an assess-
14 ment of the criteria referred to in subsection (c), the dis-
15 charge can reasonably be expected to prevent the protec-
16 tion and propagation of a balanced population of shellfish,
17 fish, and wildlife.”; and

18 (C) in subsection (c)(1)—

19 (i) in the matter preceding subpara-
20 graph (A)—

21 (I) by striking “Act (and from
22 time to time promulgate)” and insert-
23 ing the following: “the Water Pollu-
24 tion Prevention and Control Act of
25 1993, and biennially thereafter, pub-
26 lish”; and

- 1 (II) by striking “and the
2 oceans,” and inserting the following:
3 “the oceans, or any waters identified
4 pursuant to section 402(e)(1)(A),”;
5 (ii) in subparagraph (B), by striking
6 “marine” and inserting “aquatic”; and
7 (iii) in subparagraph (G), by inserting
8 “or other waters” after “oceans”.

9 (f) **PERMIT APPLICATION REQUIREMENTS.**—Section
10 402(a) (33 U.S.C. 1342(a)) is amended by adding at the
11 end the following new paragraph:

12 “(6) Not later than 2 years after the date of
13 enactment of this paragraph, the Administrator shall
14 promulgate regulations to update the application for
15 a permit under this section for municipal and indus-
16 trial dischargers to require the applicant to more
17 fully characterize the nature of the discharge of ef-
18 fluent and the contributions of the effluent to receiv-
19 ing waters.”.

20 (g) **WATERBODY AND EFFLUENT ASSESSMENT.**—

21 (1) **BIOLOGICAL MONITORING METHODS.**—Sec-
22 tion 304(a)(8) (33 U.S.C. 1314(a)(8)) is amended
23 by adding at the end the following new sentence:
24 “Not later than 3 years after the date of enactment
25 of the Water Pollution Prevention and Control Act

1 of 1993, the Administrator shall publish regulations
2 that establish biological monitoring methods, prac-
3 tices, and protocols, including measurements suitable
4 for establishing the biological condition of
5 waterbodies.”.

6 (2) WHOLE EFFLUENT TOXICITY.—Section
7 402(a)(2) (33 U.S.C. 1342(a)(2)) is amended—

8 (A) by inserting “(A)” before “The Admin-
9 istrator”; and

10 (B) by adding at the end the following new
11 subparagraph:

12 “(B) Not later than 2 years after the date of enact-
13 ment of this subparagraph, the Administrator shall pub-
14 lish regulations that provide for—

15 “(i) the establishment of a quantitative basis
16 for determining acute and chronic whole effluent
17 toxicity; and

18 “(ii) the inclusion of numerical effluent limita-
19 tions for whole effluent toxicity in a permit for any
20 discharge that the Administrator determines is likely
21 to exhibit toxicity.”.

22 (h) INNOVATIVE PRODUCTION PROCESSES AND
23 TECHNOLOGY.—Subsection (k) of section 301 (33 U.S.C.
24 1311(k)) is amended to read as follows:

1 “(k) INNOVATIVE PRODUCTION PROCESSES AND
2 TECHNOLOGY.—

3 “(1) IN GENERAL.—The Administrator (or the
4 State, in the case of a State with the authority to
5 issue permits under section 402) may, with the con-
6 sent of the State in which a source is located and
7 after notice and opportunity for comment, tempo-
8 rarily waive any permit limitation applicable to a
9 point source that is in a permit issued under section
10 402 and that has been established pursuant to sub-
11 paragraph (A) or (E) of subsection (b)(2) for the
12 purpose of encouraging the development and testing
13 of an innovative production process or pollution con-
14 trol technology that will—

15 “(A) result in an effluent reduction signifi-
16 cantly greater than that required by the limita-
17 tion otherwise applicable;

18 “(B) promote the national goal of eliminat-
19 ing the discharge of all pollutants; or

20 “(C) result in significantly lower costs than
21 processes and technologies that the Adminis-
22 trator has determined to be the best economi-
23 cally achievable for the source.

1 “(2) WAIVER.—A waiver referred to in para-
2 graph (1) shall include alternative limitations appli-
3 cable during the temporary waiver period that—

4 “(A) ensure that water quality standards
5 applicable to the waters receiving any discharge
6 from the source are not exceeded; and

7 “(B) provide for the protection of human
8 health and the environment.

9 “(3) REQUIREMENTS FOR WAIVER.—The Ad-
10 ministrator may only grant a waiver under this sub-
11 section if the Administrator finds that—

12 “(A) the innovative process or technology
13 that is the subject of the waiver has not been
14 adequately demonstrated;

15 “(B) the innovative process or technology
16 has not previously failed to operate effectively
17 or to meet any limitation otherwise applicable;
18 and

19 “(C) the owner of the source will conduct
20 such tests and monitoring during the period of
21 the waiver as are necessary to ensure that the
22 alternative limitations established pursuant to
23 paragraph (2) are not exceeded.

24 “(4) PERIOD OF WAIVER.—

1 “(A) IN GENERAL.—The period of the
2 waiver shall not exceed the period necessary to
3 determine whether the innovative process or
4 technology would, in commercial operation,
5 meet the limitations referred to in paragraph
6 (1) that would otherwise apply to the source
7 that is the subject of the waiver. The period
8 may not exceed 90 days, unless the Adminis-
9 trator extends the period for an additional 90-
10 day period.

11 “(B) TERMINATION.—The Administrator
12 or the State in which the source is located may
13 at any time terminate the waiver granted under
14 this subsection, if the Administrator or the
15 State determines that the innovative process or
16 technology—

17 “(i) has failed to achieve an effluent
18 reduction at least equivalent to the reduc-
19 tion required by a limitation referred to in
20 paragraph (1) that would otherwise apply;
21 or

22 “(ii) has exceeded any limitation in
23 the waiver established pursuant to para-
24 graph (2).

1 “(5) NUMBER OF WAIVERS.—The number of
 2 waivers granted under this subsection for a specific
 3 production process or pollution control technology
 4 may not exceed the number necessary to dem-
 5 onstrate the effectiveness of the process or tech-
 6 nology in meeting the objectives specified in para-
 7 graph (1). No waiver granted under this section
 8 shall apply to any limitation in a permit that is not
 9 directly related to the operation and testing of the
 10 innovative process or technology.”.

11 **SEC. 503. ENFORCEMENT.**

12 (a) CITIZEN ENFORCEMENT.—Section 505 (33
 13 U.S.C. 1365) is amended—

14 (1) in subsection (a)(1), by inserting “to have
 15 violated (if there is evidence that the alleged viola-
 16 tion has been repeated) or” before “to be in viola-
 17 tion”;

18 (2) in subsection (b)(1)(A), by inserting “or has
 19 occurred,” after “occurs,”;

20 (3) in subsection (f)(6), by inserting “, or has
 21 been in effect,” after “in effect”; and

22 (4) in subsection (g), by striking “is” and in-
 23 serting “has been, is,”.

24 (b) PENALTIES AND COMPENSATION.—

25 (1) BENEFICIAL USE.—

1 (A) CIVIL PENALTIES.—Section 309(d)
2 (33 U.S.C. 1319(d)) is amended—

3 (i) by striking “(d) Any person” and
4 inserting the following:

5 “(d) CIVIL PENALTIES.—

6 “(1) IN GENERAL.—Any person”; and

7 (ii) by adding at the end the following
8 new paragraph:

9 “(2) BENEFICIAL USE.—Notwithstanding any
10 other provision of law (including subchapter III of
11 chapter 7 of title 31, United States Code, and chap-
12 ter 128 of title 28, United States Code), each dis-
13 trict court may order that all or a portion of a civil
14 penalty referred to in paragraph (1) be used for a
15 beneficial project to enhance public health or the en-
16 vironment by restoring or otherwise improving, in a
17 manner consistent with this Act, the water quality,
18 wildlife, or habitat of the waterbody in which the
19 violation occurred.”.

20 (B) CITIZENS SUITS.—Section 505(a) (33
21 U.S.C. 1365(a)) is amended by adding at the
22 end the following new sentences: “Notwith-
23 standing any other provision of law (including
24 subchapter III of chapter 7 of title 31, United
25 States Code, and chapter 123 of title 28, Unit-

1 ed States Code), each district court may order
2 that, in any action under this subsection to
3 apply a civil penalty, all or a portion of the civil
4 penalty be used for a beneficial project to en-
5 hance public health or the environment by re-
6 storing or otherwise improving, in a manner
7 consistent with this Act, the water quality, wild-
8 life, or habitat of the waterbody in which the
9 violation occurred.”.

10 (C) CRIMINAL FINES.—Section 309(c) (33
11 U.S.C. 1319(c)) is amended by adding at the
12 end the following new paragraph:

13 “(8) BENEFICIAL USE.—Notwithstanding any
14 other provision of law (including subchapter III of
15 chapter 7 of title 31, United States Code, and chap-
16 ter 123 of title 28, United States Code) each court
17 that imposes a fine pursuant to this subsection may
18 order that all or a portion of the fine be used for
19 a beneficial project to enhance public health or the
20 environment by restoring or otherwise improving, in
21 a manner consistent with this Act, the water quality,
22 wildlife, or the habitat of the waterbody in which the
23 violation occurred.”.

24 (2) RESTORATION OF DAMAGED NATURAL RE-
25 SOURCES.—

1 (A) IN GENERAL.—Section 309(b) (33
2 U.S.C. 1319(b)) is amended—

3 (i) in the second sentence, by insert-
4 ing, “, to order the defendant to take such
5 other action as may be necessary, including
6 the restoration of natural resources dam-
7 aged or destroyed as a result of the viola-
8 tion,” after “such violation”; and

9 (ii) by inserting after the second sen-
10 tence the following new sentence: “The
11 maximum cost of any restoration under the
12 preceding sentence that a responsible per-
13 son may be obligated to pay to carry out
14 the order may not exceed the maximum
15 amount of a civil penalty that may be as-
16 sessed against the responsible person in a
17 civil action commenced pursuant to this
18 subsection.”.

19 (B) CITIZENS SUITS.—Section 505(a) (33
20 U.S.C. 1365(a)), as amended by paragraph
21 (1)(B), is further amended—

22 (i) in the second sentence, by insert-
23 ing “or to order any responsible person to
24 take such other action as may be nec-
25 essary, including the restoration of natural

1 resources damaged or destroyed as a result
2 of the violation," after "as the case may
3 be,"; and

4 (ii) by inserting after the second sen-
5 tence the following new sentence: "The
6 maximum cost of any restoration under the
7 preceding sentence that a responsible per-
8 son may be obligated to pay to carry out
9 the order may not exceed the maximum
10 amount of a civil penalty that may be as-
11 sessed against the responsible person in a
12 civil action commenced pursuant to this
13 subsection."

14 (3) PRETREATMENT REQUIREMENTS.—

15 (A) IN GENERAL.—Section 505(f)(4) (33
16 U.S.C. 1365(f)(4)) is amended by inserting "
17 pretreatment requirement," after "effluent
18 standard".

19 (B) STATE ENFORCEMENT.—Section
20 309(a)(1) (33 U.S.C. 1319(a)(1)) is amended
21 by inserting "any requirement imposed under a
22 pretreatment program approved under sub-
23 section (a)(3) or (b)(8) of section 402, or any
24 local limit imposed under section 402(b)(9),"
25 after "under section 402 or 404 of this Act,".

1 (C) ENFORCEMENT BY THE ADMINIS-
2 TRATOR.—Section 309(a)(3) (33 U.S.C.
3 1319(a)(3)) is amended by inserting “or any re-
4 quirement imposed under a pretreatment pro-
5 gram approved under subsection (a)(3) or
6 (b)(8) of section 402 or any local limit imposed
7 under section 402(b)(9),” after “section 404 of
8 this Act by a State,”.

9 (D) ADMINISTRATIVE PENALTIES.—Sec-
10 tion 309(g)(1)(A) (33 U.S.C. 1319(g)(1)(A)) is
11 amended by inserting “or any requirement im-
12 posed under a pretreatment program approved
13 under subsection (a)(3) or (b)(8) of section 402
14 or any local limit imposed under section
15 402(b)(9),” after “section 404 by a State,”.

16 (E) NOTICE TO PUBLICLY OWNED TREAT-
17 MENT WORKS OF NOTIFICATION.—The first
18 sentence of section 309(a)(4) (33 U.S.C.
19 1319(a)(4)) is amended by striking “and other
20 affected States” and inserting “, other affected
21 States, and any publicly owned treatment works
22 receiving wastewater from the violation”.

23 (4) FIELD CITATION PROGRAM.—Section
24 309(g), as amended by section 501(b), (33 U.S.C.
25 1319(g)) is further amended—

1 (A) by redesignating paragraphs (7)
2 through (12) as paragraphs (8) through (13),
3 respectively; and

4 (B) by inserting after paragraph (6) the
5 following new paragraph:

6 “(7) FIELD CITATION PROGRAM.—

7 “(A) AUTHORITY TO IMPLEMENT PRO-
8 GRAM.—The Administrator may establish, by
9 regulation, a field citation program under which
10 field citations for minor violations may be is-
11 sued by officers or employees designated by the
12 Administrator. The field citations issued pursu-
13 ant to this authority shall not be subject to the
14 public notice requirements of paragraph (4), or
15 any other requirement for advance public notifi-
16 cation.

17 “(B) AMOUNT OF PENALTY.—A civil pen-
18 alty assessed under this paragraph may not ex-
19 ceed \$5,000 per day for each violation, and a
20 total of \$25,000 for the violation.

21 “(C) ELECTION.—Any person to whom a
22 field citation is assessed may, within a reason-
23 able time as prescribed by the Administrator
24 through regulation, elect to pay the penalty as-
25 sessment or to request a hearing on the field ci-

1 tation. If a request for a hearing is not made
2 within the time specified in the regulation, the
3 penalty assessment in the field citation shall be
4 final.

5 “(D) HEARING.—A hearing under this
6 paragraph may not be subject to section 554 or
7 556 of title 5, but shall provide a reasonable op-
8 portunity to be heard and to present evidence.

9 “(E) EFFECT ON FUTURE ENFORCE-
10 MENT.—Payment of a civil penalty required by
11 a field citation may not be a defense to further
12 enforcement by the United States or a State.”.

13 (5) OFFSETTING PENALTIES.—

14 (A) CIVIL PENALTIES.—The second sen-
15 tence of paragraph (1) of section 309(d) (33
16 U.S.C. 1319(d)), as designated by paragraph
17 (1)(A)(i), is amended by inserting “any penalty
18 previously imposed by a court or administrative
19 agency for the same violation,” after “the viola-
20 tor,”.

21 (B) EXEMPTION FROM CERTAIN LIMITA-
22 TIONS.—Section 309(g)(6)(B) (33 U.S.C.
23 1319(g)(6)(B)) is amended—

24 (i) in clause (i), by inserting “or an
25 action under a State law comparable to

1 this subsection” after “an action under
2 this subsection”; and

3 (ii) in clause (ii), by inserting “or an
4 action under a State law comparable to
5 this subsection,” after “an action under
6 this subsection”.

7 (6) **ECONOMIC BENEFIT.**—Section 309(g) (33
8 U.S.C. 1319(g)), as amended by section 501(b) and
9 paragraph (4)(A), is further amended—

10 (A) by redesignating paragraph (13) as
11 paragraph (14); and

12 (B) by inserting after paragraph (12) the
13 following new paragraph:

14 “(13) **STATE CONSIDERATION OF ECONOMIC**
15 **BENEFIT.**—

16 “(A) **ESTABLISHMENT AND APPLICATION**
17 **OF POLICY.**—Each State that has in effect a
18 State law that has any comparable civil enforce-
19 ment authority (whether administrative or judi-
20 cial) to those authorities under this section
21 shall develop and apply an economic benefit pol-
22 icy to be used in determining the amount of any
23 penalty assessed against a violator. The policy
24 shall ensure consideration of the amount of eco-

1 nomic benefit resulting from the violation that
2 is the subject of the penalty.

3 “(B) AUTHORITY OF ADMINISTRATOR.—In
4 addition to other circumstances giving rise to
5 enforcement proceedings under this Act, the
6 Administrator may commence enforcement pro-
7 ceedings under this section against a violator
8 that is the subject of an action under State law
9 that has comparable requirements to this sub-
10 section if the State does not establish and apply
11 an economic benefit policy to be used in deter-
12 mining the amount of any penalty assessed
13 against a violator under the comparable provi-
14 sion of State law.”.

15 (7) STATE ADMINISTRATIVE ENFORCEMENT.—

16 (A) IN GENERAL.—Section 402 (33 U.S.C.
17 1342), as amended by section 501(a), is further
18 amended by adding at the end the following
19 new subsection:

20 “(t) WITHHOLDING WATER POLLUTION CONTROL
21 ASSISTANCE.—

22 “(1) IN GENERAL.—Beginning on the date that
23 is 3 years after the date of enactment of this sub-
24 section, the Administrator is authorized to withhold
25 from a State with an approved program under sub-

1 section (b), an amount not to exceed 25 percent of
2 the amount of funds allocated for any fiscal year to
3 the State under section 106, if the Administrator de-
4 termines that the State does not have adequate au-
5 thority to abate violations of—

6 “(A) permits issued under section 402; and

7 “(B) pretreatment requirements applicable
8 to industrial users of publicly owned treatment
9 works.

10 “(2) ADEQUATE AUTHORITY.—For purposes of
11 paragraph (1), in order to demonstrate adequate au-
12 thority, a State shall, at a minimum, demonstrate
13 the authority to recover an administrative civil pen-
14 alty in a maximum amount of not less than \$10,000
15 per day for each violation referred to in paragraph
16 (1).

17 “(3) AMOUNTS WITHHELD.—The Administrator
18 shall make available any amounts withheld under
19 paragraph (1) to States with an approved program
20 under subsection (b).”.

21 (B) ABATEMENT.—Section 402(b) (33
22 U.S.C. 1342(b)) is amended by striking para-
23 graph (7) and inserting the following new para-
24 graph:

1 “(7) To abate violations of the permit or the permit
2 program by—

3 “(A) the imposition of administrative penalties
4 (in a manner comparable to section 309(g));

5 “(B) the imposition of criminal penalties; or

6 “(C) other means of enforcement that the State
7 is able to demonstrate to be as effective as the
8 means described in this paragraph.”.

9 (8) FEDERAL PROCUREMENT.—Subsection (a)
10 of section 508 (33 U.S.C. 1368(a)) is amended to
11 read as follows:

12 “(a)(1)(A) No Federal agency may enter into any
13 contract, grant, or loan that is to be performed, in whole
14 or in part, using any facility owned, leased, operated, or
15 supervised, at the time of the violation, by any person who
16 has been convicted of an offense under section 309(c),
17 407, or 411 or under section 10 of the Act entitled ‘An
18 Act making appropriations for the construction, repair,
19 and preservation of certain public works on rivers and har-
20 bors, and for other purposes’, approved March 3, 1899
21 (33 U.S.C. 403) (commonly known as the ‘River and Har-
22 bor Act of 1899’).

23 “(B) With respect to a person described in subpara-
24 graph (A), a prohibition under such subparagraph shall—

1 “(i) continue for a period of not less than 1
2 year following the date of conviction as determined
3 by the Administrator;

4 “(ii) affect each facility owned or operated by
5 the person that the Administrator determines has
6 given rise to the conviction; and

7 “(iii) continue until the Administrator, in the
8 sole discretion of the Administrator, certifies that
9 the conditions giving rise to the conviction have been
10 corrected.

11 “(C) Each applicant who seeks to participate in a
12 Federal contract, grant, or loan shall disclose any convic-
13 tion described in subparagraph (A) to each appropriate
14 Federal agency.

15 “(2)(A) No Federal agency may enter into any con-
16 tract for the procurement of a good, material, or service
17 with any person who has been found liable for civil pen-
18 alties, or who has entered into any consent order or decree
19 under section 309(d) admitting to violations that may be
20 subject to the assessment of a civil penalty under section
21 309(d), as a result of 3 or more separate enforcement ac-
22 tions instituted under section 309(d) within a period of
23 less than 5 consecutive years, if the Administrator deter-
24 mines that the contract is to be performed at a facility—

1 “(i) at which the violations that resulted in the
2 determination of liability or admission of liability in
3 any enforcement action under section 309(d) oc-
4 curred; and

5 “(ii) that is owned, leased, or supervised by the
6 person who was found to be responsible or admitted
7 liability for any violation that was the subject of an
8 enforcement action under section 309(d).

9 “(B) With respect to a person described in subpara-
10 graph (A), a prohibition under such subparagraph shall—

11 “(i) continue for a period of not less than 1
12 year from the date determined by the Administrator
13 to be the final and effective date of the third en-
14 forcement action occurring within the 5-year period
15 referred to in subparagraph (A);

16 “(ii) affect each facility that the Administrator
17 determines has given rise to the enforcement actions
18 under section 309(d); and

19 “(iii) continue until the Administrator, in the
20 sole discretion of the Administrator, certifies that
21 the conditions giving rise to the violations for which
22 liability under section 309(d) has been imposed or
23 admitted in the enforcement actions under subpara-
24 graph (A) have been corrected.”.

1 (9) ADMINISTRATIVE PENALTIES.—Section
2 309(g)(2)(B) (33 U.S.C. 1319(g)(2)(B)) is amended
3 by striking “\$125,000” and inserting “\$200,000”.

4 (c) FEDERAL FACILITIES.—

5 (1) IN GENERAL.—Section 313(a) (33 U.S.C.
6 1323(a)) is amended—

7 (A) in the first sentence—

8 (i) by striking “(1)” and inserting
9 “(A)”; and

10 (ii) by striking “(2)” and inserting
11 “(B)”;

12 (B) by designating the first and second
13 sentences as paragraphs (1) and (2), respec-
14 tively;

15 (C) by striking the third sentence;

16 (D) by designating the fourth sentence as
17 paragraph (7);

18 (E) by striking the fifth sentence;

19 (F) by designating the sixth through elev-
20 enth sentences as paragraph (8);

21 (G) by inserting after paragraph (2) (as
22 designated by subparagraph (B)) the following
23 new paragraphs:

24 “(3) The Federal, State, interstate, and local sub-
25 stantive and procedural requirements, administrative au-

1 thory, and process and sanctions referred to in this sec-
2 tion shall include—

3 “(A) any administrative order; and

4 “(B) any civil or administrative penalty or fine
5 (without regard to whether the penalty or fine is pu-
6 nitive or coercive in nature or is imposed for one or
7 more isolated, intermittent, or continuing violations).

8 “(4) The United States hereby expressly waives any
9 immunity otherwise applicable to the United States with
10 respect to the substantive and procedural requirements,
11 administrative authority, and process and sanctions re-
12 ferred to in paragraph (2) (including any injunctive relief,
13 administrative order, civil or administrative penalty re-
14 ferred to in paragraph (3)(B), or reasonable service
15 charge).

16 “(5) A reasonable service charge referred to in para-
17 graph (4) includes any fee or charge assessed in connec-
18 tion with—

19 “(A) the processing and issuance of a permit;

20 “(B) the renewal of a permit;

21 “(C) an amendment to a permit;

22 “(D) the review of a plan, study, or other docu-
23 ment;

24 “(E) the inspection and monitoring of a facility:

25 and

1 “(F) any other nondiscriminatory charge,
2 that is assessed in connection with a Federal, State, inter-
3 state, or local water pollution program.

4 “(6)(A) No agent, employee, or officer of the United
5 States shall be personally liable for any civil penalty under
6 any Federal, State, interstate, or local water pollution law
7 with respect to any act or omission within the official du-
8 ties of the agent, employee, or officer.

9 “(B) An agent, employee, or officer of the United
10 States shall be subject to a criminal sanction (including
11 a fine or imprisonment) under a Federal or State water
12 pollution law, except that no department, agency, or in-
13 strumentality of the executive, legislative, or judicial
14 branch of the Federal Government shall be subject to a
15 criminal sanction referred to in this subparagraph.”; and

16 (H) in paragraph (7) (as designated by
17 subparagraph (D)), by striking “28 U.S.C.
18 1441 et seq.” and inserting “chapter 89 of title
19 28, United States Code”.

20 (2) DEFINITION OF PERSON.—Section 502(5)
21 (33 U.S.C. 1362(5)) is amended by striking “or any
22 interstate body” and inserting “any interstate body,
23 or any department, agency, or instrumentality of the
24 United States”.

1 (3) CIVIL PENALTY.—Section 311(a)(7) (33
2 U.S.C. 1321(a)(7)) is amended by striking “and a
3 partnership” and inserting “partnership, or any de-
4 partment, agency or instrumentality of the United
5 States”.

6 (4) COMPLIANCE ORDERS.—Section 309 (33
7 U.S.C. 1319) is amended by adding at the end the
8 following new subsection:

9 “(h) COMPLIANCE ORDERS FOR FEDERAL FACILITY
10 ENFORCEMENT.—

11 “(1) IN GENERAL.—

12 “(A) AUTHORIZATION.—If on the basis of
13 any information available—

14 “(i) to the Administrator, the Admin-
15 istrator determines that any department,
16 agency, or instrumentality of the United
17 States has violated or is in violation of sec-
18 tion 301, 302, 306, 307, 308, 311, 318, or
19 405, or has violated or is in violation of
20 any permit condition or limitation imple-
21 menting any of such sections in a permit
22 issued under section 402 by the Adminis-
23 trator or by a State, or in a permit issued
24 under section 404 by a State, or any re-
25 quirement imposed under a pretreatment

1 program approved under subsection (a)(3)
2 or (b)(8) of section 402;

3 “(ii) to the Secretary of the Army, the
4 Secretary of the Army determines that any
5 department, agency, or instrumentality of
6 the United States has violated or is in vio-
7 lation of any condition or limitation in a
8 permit issued under section 404; or

9 “(iii) to the Secretary of the Depart-
10 ment in which the Coast Guard is operat-
11 ing, the Secretary determines that any de-
12 partment, agency, or instrumentality of the
13 United States has violated section 311 or
14 any regulation implementing such section,
15 the Administrator or Secretary, as applicable,
16 may issue an order to assess a civil or adminis-
17 trative penalty for any past or current violation,
18 requiring compliance immediately or within a
19 specified time period, or both.

20 “(B) CONTENTS OF ORDER.—

21 “(i) IN GENERAL.—Any order issued
22 pursuant to this subsection—

23 “(I) by the Administrator, may
24 include a suspension or revocation of
25 any permit issued by the Adminis-

187

1 trator or a State under section 402 or
2 404;

3 “(II) by the Secretary of the
4 Army, may include a suspension or
5 revocation of any permit issued by the
6 Secretary of the Army or a State
7 under section 404; and

8 “(III) shall state with reasonable
9 specificity the nature of the violation.

10 “(ii) MAXIMUM PENALTY AMOUNT.—
11 Any penalty assessed in an order issued
12 pursuant to this subsection may not exceed
13 \$25,000 per day for each violation.

14 “(2) PUBLIC HEARING.—

15 “(A) IN GENERAL.—Any order issued pur-
16 suant to this subsection shall become final un-
17 less, not later than 30 days after the order is
18 served, the Federal department, agency, or in-
19 strumentality of the United States named in
20 the order requests a public hearing. If the re-
21 quest is made, the Administrator or Secretary,
22 as applicable, shall promptly conduct a public
23 hearing.

24 “(B) SUBPOENAS AND DISCOVERY.—In
25 connection with any proceeding under this sub-

1 section, the Administrator or the Secretary
2 may—

3 “(i) issue a subpoena for the attend-
4 ance and testimony of a witness or the
5 production of a relevant paper, book, or
6 document; and

7 “(ii) promulgate rules for discovery
8 procedures.

9 “(3) VIOLATION OF ORDERS.—If a violator fails
10 to take corrective action within the period specified
11 in an order issued under this subsection—

12 “(A) the Administrator or Secretary, as
13 applicable, may assess a civil penalty of not
14 more than \$25,000 for each day of continued
15 noncompliance with the order; and

16 “(B)(i) the Administrator may suspend or
17 revoke the permit issued pursuant to section
18 402 or 404 that is the subject of the order,
19 without regard to whether the permit is issued
20 by the Administrator or a State; and

21 “(ii) the Secretary of the Army may sus-
22 pend or revoke the permit issued pursuant to
23 section 404, without regard to whether the per-
24 mit is issued by the Secretary of the Army or
25 a State.

1 “(4) DETERMINING AMOUNT OF PENALTY.—In
2 determining the amount of any penalty assessed
3 under this subsection, the Administrator or Sec-
4 retary, as applicable, shall consider—

5 “(A) the seriousness of each violation;

6 “(B) the economic benefit or savings (if
7 any) to the violator resulting from each viola-
8 tion;

9 “(C) any history of the violations;

10 “(D) any good-faith efforts to avoid non-
11 compliance or to comply with applicable require-
12 ments;

13 “(E) failure, prior to the violation, to es-
14 tablish and implement a program or other orga-
15 nized effort to achieve and maintain compliance
16 with environmental laws (including regulations);
17 and

18 “(F) such other matters in mitigation and
19 aggravation as justice may require.”.

20 (d) EMERGENCY POWERS.—Section 504 (33 U.S.C.
21 1364) is amended—

22 (1) in subsection (a)—

23 (A) by inserting after “(a)” the following
24 new subsection heading: “IN GENERAL.—”;

1 (B) by striking “is presenting” and insert-
2 ing “may present”;

3 (C) by inserting “, whether actual or
4 threatened,” after “substantial endangerment”;
5 and

6 (D) by striking “may bring suit” and in-
7 serting the following: “or to the environment,
8 the Administrator may—

9 “(1) issue such orders, or take such action, as
10 may be necessary to protect public health or welfare
11 or the environment; and

12 “(2) bring suit on behalf of the United States
13 in a district court of the United States of appro-
14 priate jurisdiction against any person who causes or
15 contributes to the alleged pollution or threat of pol-
16 lution to—

17 “(A) immediately restrain the person from
18 discharging or threatening to discharge each
19 pollutant causing or contributing to the pollu-
20 tion;

21 “(B) order the person to take such other
22 action as may be necessary; or

23 “(C) take action under both subparagraphs
24 (A) and (B).”; and

1 (2) by adding at the end the following new sub-
2 section:

3 “(b) ADDITIONAL ACTION.—The Administrator may
4 take additional action under this section, including issuing
5 such orders as may be necessary to protect public health
6 or welfare or the environment.”.

7 (e) ADMINISTRATIVE AMENDMENTS.—

8 (1) REQUIREMENT FOR CONSULTATION ON AD-
9 MINISTRATIVE ORDERS.—Section 309(g) (33 U.S.C.
10 1319(g)), as amended by section 501(b) and sub-
11 sections (b)(4)(A) and (b)(6)(A), is further
12 amended—

13 (A) by redesignating paragraph (14) as
14 paragraph (15); and

15 (B) by inserting after paragraph (13) the
16 following new paragraph:

17 “(14) CONSULTATION.—The failure of the Ad-
18 ministrator to consult with a State concerning a vio-
19 lation of an order pursuant to paragraph (1) may
20 not constitute a defense in any action to assess a
21 civil penalty under this subsection and may not in-
22 validate the assessment of any penalty under this
23 subsection.”.

1 (2) EFFECT OF STATE ENFORCEMENT AC-
2 TIONS.—Section 309(g)(6)(A) (33 U.S.C.
3 1319(g)(6)(A)) is amended—

4 (A) in clause (i), by adding “or” at the
5 end;

6 (B) by striking clause (ii);

7 (C) by redesignating clause (iii) as clause
8 (ii); and

9 (D) in clause (ii) (as so redesignated)—

10 (i) by striking “, the Secretary, or the
11 State” and inserting “or the Secretary”;
12 and

13 (ii) by striking “or such comparable
14 State law, as the case may be,”.

15 (3) SINGLE OPERATIONAL UPSETS.—

16 (A) CRIMINAL PENALTIES.—Section
17 309(c) (33 U.S.C. 1319(c)), as amended by
18 subsection (b)(1)(C), is further amended—

19 (i) by striking paragraph (5); and

20 (ii) by redesignating paragraphs (6),
21 (7), and (8) as paragraphs (5), (6), and
22 (7), respectively.

23 (B) CIVIL PENALTIES.—Paragraph (1) of
24 section 309(d) (33 U.S.C. 1319(d)), as des-
25 ignated by subsection (b)(1)(A)(i), is amended

1 by striking "For purposes of this subsection, a
2 single operational upset which leads to simulta-
3 neous violations of more than one pollutant pa-
4 rameter shall be treated as a single violation."

5 (C) ADMINISTRATIVE PENALTIES.—Section
6 309(g)(3) (33 U.S.C. 1319(g)(3)) is amended
7 by striking "For purposes of this subsection, a
8 single operational upset which leads to simulta-
9 neous violations of more than one pollutant pa-
10 rameter shall be treated as a single violation."

11 (4) OBTAINING INFORMATION.—

12 (A) IN GENERAL.—Subsection (a) of sec-
13 tion 308 (33 U.S.C. 1318(a)) is amended to
14 read as follows:

15 "(a) IN GENERAL.—

16 "(1) DUTIES OF THE ADMINISTRATOR.—When-
17 ever the Administrator is required to carry out the
18 objective of this Act (as described in section 101(a)),
19 including—

20 "(A) developing or assisting in the develop-
21 ment of an effluent limitation, or other limita-
22 tion, prohibition, or effluent standard,
23 pretreatment standard, or standard of perform-
24 ance under this Act;

1 “(B) determining whether any person is in
2 violation of an effluent limitation, or other limi-
3 tation, prohibition, effluent standard,
4 pretreatment standard, or standard of perform-
5 ance, or is causing or contributing to the
6 exceedance of a water quality standard, under
7 this Act;

8 “(C) a requirement established under this
9 section; or

10 “(D) carrying out sections 305, 311, 402,
11 404 (relating to State permit programs), 405,
12 and 504,

13 the Administrator may require a person subject to a
14 requirement of this Act to meet the requirements of
15 paragraph (2) relating to the provision of informa-
16 tion to the Administrator if the Administrator deter-
17 mines that the information is relevant to the imple-
18 mentation of this Act.

19 “(2) REQUIREMENTS.—In each case described
20 in paragraph (1), the Administrator may require a
21 person subject to a requirement of this Act to—

22 “(A) establish and maintain such records;

23 “(B) make such reports;

1 “(C) install, use, and maintain such mon-
2 itoring equipment or methods (including, if ap-
3 propriate, biological monitoring methods);

4 “(D) sample such effluents and affected
5 receiving waters (in accordance with such meth-
6 ods, at such locations, at such intervals, and in
7 such manner as the Administrator shall pre-
8 scribe;

9 “(E) provide data necessary to support the
10 development of water quality criteria for a pol-
11 lutant present in the discharge of the owner or
12 operator; and

13 “(F) provide such other information,
14 as the Administrator may reasonably require.

15 “(3) INSPECTION.—The Administrator or an
16 authorized representative of the Administrator (in-
17 cluding an authorized contractor acting as a rep-
18 resentative of the Administrator) on presentation of
19 the credentials of the Administrator or
20 representative—

21 “(A) shall have a right of entry to, upon,
22 or through any premises in which an effluent
23 source is located or in which any records re-
24 quired to be maintained under paragraph (2)
25 are located; and

1 “(B) may at reasonable times have access
2 to and copy any records, inspect any monitoring
3 equipment or method required under paragraph
4 (2), and sample any effluents that the owner or
5 operator of the source is required to sample
6 under such paragraph.”.

7 (B) TECHNICAL AMENDMENTS.—Section
8 308 (33 U.S.C. 1318) is amended—

9 (i) in subsection (b), by inserting
10 “RECORDS; REPORTS; INFORMATION.—”
11 after “(b)”; and

12 (ii) in subsection (c), by inserting
13 “PROCEDURES.—” after “(c)”.

14 (5) SUBPOENAS.—The first sentence of section
15 509(a)(1) (33 U.S.C. 1369(a)(1)) is amended by in-
16 serting “or any enforcement activity under this Act”
17 after “section 507(e) of this Act”.

18 (f) TECHNICAL AMENDMENT.—Section 309(g)(2)
19 (33 U.S.C. 1319(g)(2)) is amended—

20 (1) in subparagraph (A), by inserting “day for
21 each” after “exceed \$10,000 per”; and

22 (2) in the first sentence of subparagraph (B),
23 by striking “for each day during which the violation
24 continues” and inserting “for each violation”.

1 **TITLE VI—PROGRAM**
2 **MANAGEMENT**

3 **SEC. 601. TECHNOLOGY DEVELOPMENT.**

4 Section 105 (33 U.S.C. 1255) is amended to read as
5 follows:

6 **"SEC. 105. TECHNOLOGY DEVELOPMENT.**

7 “(a) **IN GENERAL.**—The Administrator shall estab-
8 lish a program to develop and demonstrate practices,
9 methods, technologies, or processes that may be effective
10 in the prevention and control of sources or potential
11 sources of water pollution.

12 “(b) **GRANT ASSISTANCE.**—

13 “(1) **IN GENERAL.**—The Administrator may
14 provide grants to public agencies and authorities and
15 nonprofit organizations and institutions, and enter
16 into cooperative agreements or contracts with other
17 persons, to develop or demonstrate water pollution
18 prevention and control practices, methods, tech-
19 nologies, or processes.

20 “(2) **REQUIREMENTS FOR DEMONSTRATION**
21 **PROJECTS.**—The Administrator may provide assist-
22 ance for a demonstration project under this sub-
23 section only if—

24 “(A) the demonstration project will serve
25 to demonstrate a new or significantly improved

1 practice, method, technology, or process, or the
2 feasibility and cost effectiveness of a practice,
3 method, technology, or process that exists at
4 the time of the demonstration, but is unproven;

5 “(B) the demonstration project will not du-
6 plicate any other Federal, State, local, or com-
7 mercial effort to demonstrate the practice,
8 method, technology, or process;

9 “(C) the demonstration project meets the
10 requirements of this section and serves the pur-
11 poses of this Act;

12 “(D) the demonstration of the practice,
13 technology, or process will comply with all other
14 laws (including regulations) for the protection
15 of human health and welfare and the environ-
16 ment; and

17 “(E)(i) in the case of a contract or cooper-
18 ative agreement, the practice, method, tech-
19 nology, or process would not be adequately
20 demonstrated by State, local, or private per-
21 sons; or

22 “(ii) in the case of an application for fi-
23 nancial assistance by a grant, the practice,
24 method, technology, or process is not likely to

1 receive adequate financial assistance from other
2 sources.

3 “(3) REQUIREMENTS FOR DEMONSTRATION
4 PROGRAM.—The demonstration program established
5 under this subsection shall include—

6 “(A) solicitations for demonstration
7 projects by the Administrator;

8 “(B) the selection of suitable demonstra-
9 tion projects from among proposed demonstra-
10 tion projects;

11 “(C) the supervision of the demonstration
12 projects;

13 “(D) the evaluation of the results of the
14 demonstration projects; and

15 “(E) the dissemination of information con-
16 cerning the effectiveness and feasibility of the
17 practices, methods, technologies, and processes
18 that are proven to be effective under the dem-
19 onstration projects.

20 “(4) SOLICITATIONS.—

21 “(A) IN GENERAL.—Not later than 1 year
22 after the date of enactment of this paragraph,
23 and not less frequently than annually there-
24 after, the Administrator shall publish a sollicita-
25 tion notice for proposals to demonstrate, by

200

1 prototype or at full-scale, practices, methods,
2 technologies, and processes that are (or may be)
3 effective in controlling sources or potential
4 sources of water pollution.

5 “(B) CONTENTS OF SOLICITATION NO-
6 TICE.—The solicitation notice shall prescribe
7 the information to be included in the proposal,
8 including technical and economic information
9 derived from the research and development ef-
10 forts of the applicant, and other information
11 sufficient to allow the Administrator to assess
12 the potential effectiveness and feasibility of the
13 practice, method, technology, or process that is
14 the subject of the demonstration project.

15 “(5) APPLICATION.—Any person may submit
16 an application to the Administrator in response to a
17 solicitation under paragraph (4). The application
18 shall contain a proposed demonstration plan setting
19 forth how and when the project is to be carried out
20 and such other information as the Administrator
21 may require.

22 “(6) SELECTION OF DEMONSTRATION
23 PROJECTS.—In selecting practices, methods, tech-
24 nologies, and processes to be demonstrated, the Ad-

1 administrator shall evaluate each project according to
2 the following criteria:

3 “(A) The potential for the proposed prac-
4 tice, method, technology, or process to effec-
5 tively control sources or potential sources of
6 pollutants that present risks to human health.

7 “(B) The potential for the practice, meth-
8 od, technology, or process to contribute to the
9 advancement of pollution control with respect to
10 an industry for which an effluent guideline is
11 published pursuant to section 304.

12 “(C) The potential for the practice, meth-
13 od, technology, or process to effectively prevent
14 the discharge of pollutants that present risks to
15 human health and the environment.

16 “(D) The potential for the practice, meth-
17 od, technology, or process to contribute to the
18 advancement of the treatment of sewage or the
19 management of sewage sludge.

20 “(E) The potential for the practice, meth-
21 od, technology, or process to contribute to re-
22 ductions of pollution associated with nonpoint
23 sources of pollution.

1 “(F) The capability of the applicant to
2 successfully complete the demonstration project
3 as described in the application.

4 “(G) The likelihood that the demonstrated
5 practice, method, technology, or process could
6 be applied in other locations and under other
7 circumstances to control sources or potential
8 sources of pollutants (taking into consideration
9 the cost, effectiveness, and technological fea-
10 sibility of the practice).

11 “(H) The extent of financial support from
12 the applicant to accomplish the demonstration
13 as described in the application.

14 “(I) The capability of the applicant to dis-
15 seminate the results of the demonstration or
16 otherwise make the benefits of the practice,
17 method, technology, or process widely available
18 to the public in a timely manner.

19 “(7) APPROVAL OF APPLICATIONS.—The Ad-
20 ministrators shall approve or disapprove an applica-
21 tion for a project under this subsection in an expedi-
22 tious manner. In the case of a disapproval of an ap-
23 plication for a project, the Administrator shall notify
24 the applicant of the reasons for the disapproval.

1 “(8) AGREEMENT.—Each applicant selected to
2 conduct a demonstration project under this sub-
3 section shall be required, as a condition of receiving
4 funds made available pursuant to this subsection, to
5 enter into an agreement with the Administrator to
6 provide for monitoring, testing procedures, quality
7 control, and such other measurements necessary to
8 evaluate the results of demonstration projects or fa-
9 cilities intended to control sources or potential
10 sources of contaminants.

11 “(9) FEDERAL SHARE.—

12 “(A) IN GENERAL.—Except as provided in
13 subparagraph (B), the Federal share for a dem-
14 onstration project under this section shall not
15 exceed 75 percent of the total cost of the
16 project.

17 “(B) CERTAIN BASIC RESEARCH.—In any
18 case in which the Administrator determines
19 that a research project under this subsection is
20 basic research that would not otherwise be un-
21 dertaken, the Administrator may award a grant
22 for the research project under this subsection
23 with respect to which the Federal share may
24 equal 100 percent of the total cost of the
25 project.

1 “(c) AUTHORIZATION OF APPROPRIATIONS.—There
2 are authorized to be appropriated to the Environmental
3 Protection Agency to carry out this section \$20,000,000
4 for each of fiscal years 1994 through 2000.”.

5 **SEC. 602. STATE CERTIFICATION.**

6 The first sentence of section 401(a)(1) (33 U.S.C.
7 1341(a)(1)) is amended by inserting before the period the
8 following: “and that any such activity will comply with
9 water quality standards adopted under section 303 and
10 allow for the protection, attainment, and maintenance of
11 designated uses included in the standards”.

12 **SEC. 603. REPORTS TO CONGRESS.**

13 (a) CLEAN WATER REPORT.—Subsections (a)
14 through (c) of section 516 (33 U.S.C. 1375 (a) through
15 (c), respectively) are amended to read as follows:

16 “(a) CLEAN WATER REPORT.—

17 “(1) IN GENERAL.—On January 1 of the year
18 following the date of enactment of subparagraph
19 (A), and every 2 years thereafter, the Administrator
20 shall submit to Congress a report on measures taken
21 toward the implementation of the goals and objec-
22 tives of this Act, including—

23 “(A) a summary of the results achieved in
24 the field of water pollution control research,

1 demonstrations, experiments, studies, and relat-
2 ed matters;

3 “(B) a summary of the status of tech-
4 nology-based water pollution controls;

5 “(C) a summary of the development of pol-
6 lutant criteria documents and the adoption of
7 water quality and sediment quality standards;

8 “(D) an assessment of progress in the de-
9 velopment of effluent limitations pursuant to
10 sections 301, 304, 306, and 307;

11 “(E) a description of State nonpoint
12 source pollution control programs;

13 “(F) an assessment of the progress in the
14 identification of and development of programs
15 for water quality problem areas, including—

16 “(i) the national estuary program es-
17 tablished under section 320;

18 “(ii) the Great Lakes program estab-
19 lished under section 118;

20 “(iii) the Chesapeake Bay program es-
21 tablished under section 117;

22 “(iv) other programs that the Admin-
23 istrator considers appropriate; and

1 “(v) other estuaries and rivers for
2 which management conferences are being
3 conducted;

4 “(G) a description of alternative require-
5 ments for effluent discharges established under
6 section 301 or 307 (including any alternative
7 requirement established under section 301(b)(2)
8 or 307(b) on the basis of fundamentally dif-
9 ferent factors (as described in section 301(d));

10 “(H) a description of activities relating to
11 wastewater treatment operator training and
12 certification;

13 “(I)(i) an identification and assessment of
14 noncompliance with the enforceable require-
15 ments of this Act (including an assessment of
16 noncompliance by Federal facilities); and

17 “(ii) a description of all enforcement ac-
18 tions pending or completed under this Act dur-
19 ing the 2-year period immediately preceding the
20 date of the report; and

21 “(J) recommendations concerning improve-
22 ments to the water quality programs authorized
23 by this Act.

24 “(2) CONSULTATION BY ADMINISTRATOR.—The
25 Administrator shall consult with the heads of State

1 agencies in the development of the report required
2 under this subsection.

3 “(b) WATER QUALITY INFRASTRUCTURE NEEDS AS-
4 SESSMENT.—

5 “(1) IN GENERAL.—The Administrator shall
6 conduct a comprehensive assessment of the cost of
7 construction of public facilities needed to accomplish
8 the water quality goals of this Act.

9 “(2) CONTENTS OF ASSESSMENT.—The assess-
10 ment under this subsection shall, at a minimum,
11 describe—

12 “(A) on a national basis, and for each
13 State, the cost of construction for the rehabili-
14 tation, replacement, and upgrading of publicly
15 owned treatment works in existence during the
16 calendar year that is 2 years before the date of
17 the report, including an estimate of the portion
18 of the costs associated with meeting the en-
19 forceable requirements of this Act;

20 “(B) on a national basis, and for each
21 State the cost of construction of expanded or
22 new publicly owned treatment works, including
23 an estimate of the portion of the costs associ-
24 ated with meeting the requirements of this Act;

1 “(C) the cost of implementing plans for
2 the elimination of combined stormwater and
3 sanitary sewer overflows developed pursuant to
4 section 406, including any additional treatment
5 needed to ensure compliance with water quality
6 standards;

7 “(D) the portion of the costs described in
8 subparagraphs (A), (B), and (C) associated
9 with treatment works serving fewer than 2,500
10 individuals;

11 “(E) the cost to Federal, State, and local
12 governments and agricultural producers of the
13 construction of measures to control nonpoint
14 sources of pollution implemented in accordance
15 with programs developed pursuant to section
16 319;

17 “(F) the cost of construction of measures
18 and facilities required to comply with permits
19 for the control of municipal discharges of
20 stormwater;

21 “(G) the cost of implementation of con-
22 servation and management plans approved pur-
23 suant to section 320(f);

1 “(H) the cost of implementation of
2 Lakewide Management Plans and Remedial Ac-
3 tion Plans developed pursuant to section 118;

4 “(I) the cost of implementation of clean
5 lakes projects pursuant to section 314; and

6 “(J) the cost of implementation of water-
7 shed management plans approved by the Ad-
8 ministrator pursuant to section 321.

9 “(3) SUBMISSION OF ASSESSMENT.—Not later
10 than 4 years after the date of enactment of this
11 paragraph, and every 4 years thereafter, the Admin-
12 istrator shall submit the assessment required under
13 this subsection to Congress.

14 “(c) RESERVED.”.

15 (b) ELIMINATION OF OTHER REPORTS.—

16 (1) DEVICES FOR FLOW REDUCTION.—Section
17 104(a)(5) (33 U.S.C. 1254(a)(5)) is amended by
18 striking “, and shall report on such quality in the
19 report required under subsection (a) of section 516”.

20 (2) CHESAPEAKE BAY.—Section 117 (33
21 U.S.C. 1267) is amended—

22 (A) by striking subsection (c); and

23 (B) by redesignating subsection (d) as sub-
24 section (c).

210

1 (3) GREAT LAKES.—Section 118(c) (33 U.S.C.
2 1268(c)) is amended—

3 (A) by striking paragraph (10); and

4 (B) by redesignating paragraph (11) as
5 paragraph (10).

6 (4) OPERATION OF PUBLICLY OWNED TREAT-
7 MENT WORKS.—Title II (33 U.S.C. 1281 et seq.) is
8 amended by striking section 210 and inserting “Sec-
9 tion 210. RESERVED.”.

10 (5) ALTERNATIVE DISCHARGE REQUIRE-
11 MENTS.—Section 301(n) (33 U.S.C. 1311(n)) is
12 amended by striking paragraph (8).

13 (6) CONDITION OF LAKES.—Section 314 (33
14 U.S.C. 1324) is amended—

15 (A) in subsection (a)—

16 (i) by striking paragraph (3); and

17 (ii) by redesignating paragraph (4) as
18 paragraph (3); and

19 (B) in subsection (b)—

20 (i) by striking paragraph (3); and

21 (ii) by redesignating paragraph (4) as
22 paragraph (3).

23 (7) STATUS OF NONPOINT PROGRAMS.—Section
24 319(m) (33 U.S.C. 1329(m)) is amended by striking
25 “(m) REPORTS OF ADMINISTRATOR.—” and all that

1 follows through “(2) FINAL REPORT.—Not later
2 than” and inserting the following:

3 “(m) FINAL REPORT OF THE ADMINISTRATOR.—Not
4 later than”.

5 (8) ESTUARINE RESEARCH AND MONITORING.—
6 Section 320(j) (33 U.S.C. 1330(j)) is amended—

7 (A) by striking paragraph (2);

8 (B) by striking “(j) RESEARCH.—” and all
9 that follows through “In order to” and insert-
10 ing the following:

11 “(j) RESEARCH.—In order to”;

12 (C) by striking “(A) a long-term program”
13 and inserting the following:

14 “(1) a long-term program”;

15 (D) by striking subparagraph (B) and in-
16 serting the following new paragraph:

17 “(2) a program of ecosystem assessment assist-
18 ing in the development of—

19 “(A) baseline studies that determine the
20 state of estuarine zones and the effects of natu-
21 ral and anthropogenic changes; and

22 “(B) predictive models capable of translat-
23 ing information on specific discharges or gen-
24 eral pollutant loadings within estuarine zones
25 into a set of probable effects on the zones;”;

1 (E) by striking “(C) a comprehensive” and
 2 inserting the following:

3 “(3) a comprehensive”; and

4 (F) by striking “(D) a program” and in-
 5 serting the following:

6 “(4) a program”.

7 (9) FEDERAL PROCUREMENT.—Section 508 (33
 8 U.S.C. 1368) is amended by striking subsection (e).

9 **SEC. 604. DEFINITIONS.**

10 (a) DEFINITION OF POINT SOURCE.—Section
 11 502(14) (33 U.S.C. 1362(14)) is amended by adding at
 12 the end the following new sentence: “The term shall in-
 13 clude a landfill leachate collection system.”.

14 (b) CONFORMING AMENDMENT.—Section 507 of the
 15 Water Quality Act of 1987 (33 U.S.C. 1362 note) is re-
 16 pealed.

17 **SEC. 605. INDIAN PROGRAMS.**

18 (a) SEWAGE TREATMENT.—Section 518(c) (33
 19 U.S.C. 1377(c)) is amended—

20 (1) by striking “one-half of one percent of the
 21 sums appropriated under section 207” and inserting
 22 “1 percent of the sums appropriated under section
 23 607”; and

24 (2) by adding at the end the following new sen-
 25 tence: “The Administrator shall provide the funds

1 reserved under this subsection directly to Indian
2 tribes and may make a grant in an amount not to
3 exceed 100 percent of the cost of a project that is
4 the subject of the grant. In making a grant under
5 this subsection, the Administrator shall give priority
6 to projects that address the most significant public
7 health and environmental pollution problems, as de-
8 termined by a needs assessment conducted under
9 paragraph (2).”.

10 (b) NONPOINT POLLUTION CONTROL.—Section
11 518(f) (33 U.S.C. 1377(f)) is amended—

12 (1) in the second sentence, by striking “one-
13 third” and inserting “one-half”;

14 (2) in the third sentence, by striking “(d)” and
15 inserting “(e)”; and

16 (3) by adding at the end the following new sen-
17 tence: “Notwithstanding section 319(h)(3), the Ad-
18 ministrator may make a grant under this subsection
19 in an amount not to exceed 100 percent of the cost
20 of the project that is the subject of the grant.”.

21 (c) REVOLVING LOAN FUNDS.—Section 603(c)(1)
22 (33 U.S.C. 1383(c)(1)), as amended by section 101(a)(2),
23 is further amended by inserting “Indian tribe,” after
24 “State agency”.

1 **SEC. 606. CLEAN WATER EDUCATION.**

2 (a) IN GENERAL.—Title V (33 U.S.C. 1361 et seq.)
3 is amended—

4 (1) by redesignating section 519 as section 520;
5 and

6 (2) by inserting after section 518 the following
7 new section:

8 **“SEC. 519. CLEAN WATER EDUCATION.**

9 “(a) AUTHORITY.—

10 “(1) IN GENERAL.—The Administrator shall es-
11 tablish a national program of education and infor-
12 mation to increase public awareness concerning
13 water quality.

14 “(2) EMPLOYEES TO IMPLEMENT PROGRAM.—
15 The Administrator shall ensure that for each fiscal
16 year, not fewer than—

17 “(A) 5 full-time equivalent employees are
18 assigned on a full-time basis to carry out this
19 section; and

20 “(B) 1 full-time equivalent employee is as-
21 signed on a full-time basis to carry out this sec-
22 tion in each regional office.

23 “(b) VOLUNTEER PROGRAMS.—

24 “(1) IN GENERAL.—The Administrator, in co-
25 operation with the States, shall foster and provide
26 guidance for volunteer citizen programs for the as-

1 assessment, oversight, and protection of individual
2 waterbodies.

3 “(2) HANDBOOK.—Not later than 2 years after
4 date of enactment of this subsection, the Adminis-
5 trator shall publish a handbook and other related in-
6 formational materials with respect to the organiza-
7 tion, management, functions, and activities of volun-
8 teer citizen programs under this subsection.

9 “(3) VOLUNTEER CITIZEN PROGRAMS.—Not
10 later than 3 years after the date of enactment of
11 this subsection, and biennially thereafter, each State
12 shall provide to the Administrator a list of volunteer
13 citizen programs and the waterbody served by each
14 program included in the list. Not later than 180
15 days after receiving the State lists required to be
16 submitted pursuant to this paragraph, the Adminis-
17 trator shall publish a national list of volunteer citi-
18 zen programs that includes the information in the
19 State lists.

20 “(4) FEDERAL ENFORCEMENT.—In the case of
21 any action taken pursuant to subsection (c) or (d)
22 of section 309, an appropriate Federal official shall
23 advise the court of any volunteer citizen program
24 listed pursuant to paragraph (3) for the waterbody
25 associated with the violation.

1 “(c) AWARDS.—

2 “(1) IN GENERAL.—The Administrator shall
3 implement a program to provide official recognition
4 of the Federal Government to industrial organiza-
5 tions, political subdivisions of States, and volunteer
6 citizen programs that have demonstrated an out-
7 standing commitment to the prevention and control
8 of water pollution.

9 “(2) SELECTION BY REGIONAL ADMINISTRA-
10 TORS.—Each regional administrator of the Environ-
11 mental Protection Agency shall select not more than
12 3 industrial organizations, 3 political subdivisions,
13 and 3 volunteer citizen programs within the region
14 under the jurisdiction of the regional administrator
15 for an award under this subsection for each fiscal
16 year.

17 “(3) SELECTION BY ADMINISTRATOR.—The Ad-
18 ministrator shall select from the organizations, polit-
19 ical subdivisions, and volunteer programs that re-
20 ceive awards pursuant to paragraph (2) not more
21 than 3 industrial organizations, 3 political subdivi-
22 sions, and 3 volunteer programs to receive national
23 awards.

24 “(4) FORM OF AWARD.—The Administrator
25 shall award a certificate or plaque of suitable design

1 to each industrial organization, political subdivision,
 2 or volunteer program that receives an award under
 3 this subsection.

4 “(5) NOTICE AND PUBLICATION.—The Presi-
 5 dent, the Governor of the appropriate State, the
 6 Speaker of the House of Representatives, and the
 7 President pro tempore of the Senate shall be notified
 8 of each award under this subsection by the Adminis-
 9 trator, and the awarding of the recognition shall be
 10 published in the Federal Register.”.

11 (b) TECHNICAL CORRECTIONS.—

12 (1) Section 104(c) (33 U.S.C. 1254(c)) is
 13 amended by striking “Health, Education, and Wel-
 14 fare” and inserting “Health and Human Services”.

15 (2) Section 501 (33 U.S.C. 1361) is amended—

16 (A) by striking subsection (e); and

17 (B) by redesignating subsection (f) as sub-
 18 section (e).

19 **SEC. 607. NATIONAL ESTUARY PROGRAM.**

20 Section 320 (33 U.S.C. 1130) is amended—

21 (1) in subsection (g)(2), by inserting “and im-
 22 plementation” after “development”; and

23 (2) in subsection (i), by striking “1987, 1988,
 24 1989, 1990, and 1991” and inserting “1987
 25 through 2000”.

○

REAUTHORIZATION OF THE CLEAN WATER ACT

WEDNESDAY, JUNE 23, 1993

U.S. SENATE,
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,
SUBCOMMITTEE ON CLEAN WATER, FISHERIES, AND WILDLIFE,
Washington, DC.

FUNDING; STORMWATER AND COMBINED SEWER OVERFLOWS

The subcommittee met, pursuant to notice, at 10:07 a.m. in room SD-406, Dirksen Senate Office Building, Hon. Max Baucus [chairman of the full committee] presiding.

Present: Senators Baucus, Faircloth, Lautenberg, Chafee, Kempthorne, Durenberger and Wofford.

Senator BAUCUS. The hearing will come to order.

Good morning, everyone.

The chairman of the subcommittee, Senator Graham, is unable to be here at this time. He's at the White House. He will join us when he is able. He has a statement that will be included in the record. In his absence, I will chair this hearing. There may be a time when I will leave and Senator Chafee will then chair the meeting until Senator Graham arrives.

Today's hearing is about two related problems under the Clean Water Act. Before I get into those, I'd like to put in the record an editorial from today's Washington Post entitled, "The First Big Environmental Bill." It states approvingly of the efforts of Senator Chafee and myself in reauthorizing the Clean Water Act.

[Senator Graham's statement and the editorial referred to follow:]

STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

This is the second in a series of hearings to be held by this subcommittee on the reauthorization of the Clean Water Act. Last week, we began the series by looking at some broad policy questions and announced some of the problems that remain unsolved by the Act.

While broad questions remain, today we begin to get into some of the details. Today, we will focus for the most part upon our cities and upon funding issues.

There are several important funding questions. The first of these is whether to continue federal funding and, if so, how much and for how long? Since 1972, the federal government has provided about \$60 billion in construction grants assistance to help communities comply with the Act. Over the years, the level and manner of assistance has changed. In 1981, the level dropped from \$5 billion to \$2.4 billion and the types of projects eligible for funding was restricted. In 1987, the grants program was replaced with one that established State Revolving Funds. The new program had a simple premise: states would lend federal and state dollars to communities, who would pay them back, thus creating a continuous source of funding that sus-

tained itself and "revolved." This feature allowed federal support to be phased out over several years and to expire after 1994.

The bill before us not only extends federal funding to SRFs through the year 2000, but gradually increases the level from \$2.5 billion in 1995 to \$5 billion in the year 2000, so long as deficit reduction goals are met along the way. The justification for this change in policy seems to be grounded in the continued need for federal support.

We are told that EPA has reported more than \$80 billion in un-met needs in our cities nationwide just for major wastewater treatment facility construction and repair and that the cities have identified \$30 billion more on top of that. But, staggering as these figures are, they don't cover stormwater or combined sewer overflows. They don't cover non-point source pollution and they don't cover drinking water. I believe we will hear a great deal today about the needs of our cities.

The second question is how should the SRFs be used to maximize the federal funds we do provide to try to meet some of these needs. When I was Governor, we had a state program similar to the SRF that provided funding just for the construction phase because that was when cities had the most difficult time securing financing. After construction, cities used the revenues they collected to secure their permanent financing. I want to explore how we can make the SRF revolve more quickly. We also need to look at the issue of leveraging as we try to utilize federal funds in a manner that will generate the most effective use of funds from other sources.

Third, we must look at the way these funds are allocated to the states. Every two years, EPA completes a survey with the states to determine their funding needs under the SRF. Incredibly, we have ignored the last seven of these surveys and continue to allocate federal dollars to the states based on the needs survey completed in 1978. This distortion of reality results in some states getting far more than they need, while others get a fraction of their needs met.

We will also address other critical funding issues, including how to help our small and disadvantaged communities and whether to again expand the projects eligible for SRF funding. Since it is clear that we have failed to address all the needs in the country that are currently covered, we must discuss the wisdom of trying to fund new categories of need.

I also want us to address how we can make the approaches to wastewater treatment and stormwater more environmentally appropriate, but also more cost-effective. On Monday, I worked at a sewer plant in West Palm Beach, Florida, which is considering methods of recycling water. Today that water is injected into very expensive deep wells. This recycling not only has the potential of saving a valuable resource, but also of enhancing the economic viability of wastewater treatment.

We also need to look at how federal government can encourage practices that would prevent pollution, such as land use practices that would mitigate stormwater runoff and facilitate the most efficient governmental structures, such as regional cooperation among local governments to construct the most cost-efficient disposal systems. How well have these efforts worked in the past and how should they be considered as part of the reauthorization of the Clean Water Act?

Finally, we will address two other issues of great importance to our communities: the regulation of stormwater and combined sewer overflows.

These are distinct problems. Our cities tell us that they simply cannot afford stormwater regulation under the Clean Water Act, especially when faced with other burdens, including solid waste management and wastewater treatment. They tell us that it will be prohibitively expensive to comply with effluent guidelines and permits for each of the 8 million stormwater outfalls.

The bill before us provides these communities with some relief. Small cities, those whose population is 100,000 or less, would be not have to obtain separate stormwater permits. The large and mid-sized cities would be subject to EPA guidelines, but would not be required to comply with effluent guidelines or water quality standards for 10 years. The cities desperately seek this relief, while those in the environmental community fear that this represents yet another delay in a series of delays to require cities to address serious pollution problems.

We need to discuss today whether the bill provides the best approach to solving these economic issues, while still providing adequate environmental protection.

Combined sewer overflows occur in systems that combine wastewater and stormwater, thus creating the risk that during severe storms, the volume of water will overload the wastewater treatment facilities, spilling untreated waste into the waterways. This is a problem primarily affecting some of older cities in the Northeast, Mid-West and Far West and the potential cost is also in the billions. The bill adopts a consensus policy adopted by EPA with the assistance of environmental groups and the cities. We will discuss the adequacy of that approach in addressing this problem.

As can be seen, some of these issues can become quite complex. We will try to get the best advice from our witnesses as we go along. As I indicated last week, we will ask our witnesses to utilize the provisions of S. 1114, filed last week by Senators Baucus and Chafee, in giving detailed analysis and recommendations for Subcommittee action. In this fashion, I hope to focus the Subcommittee's attention upon real problems, the best solution for them, and the legislative language that would incorporate that best answer.

The Washington Post

AN INDEPENDENT NEWSPAPER

First Big Environmental Bill

THE FIRST MAJOR piece of environmental legislation in this Congress seems likely to be a strengthening of the Clean Water Act. House and Senate committees have both begun work on such a bill. The administration is also working out a position, though five months into the president's term the key official—assistant administrator for water at the Environmental Protection Agency—has yet to be appointed. Last week EPA Administrator Carol Browner testified in mostly general terms on a thoughtful draft bill by Sens. Max Baucus and John Chafee of the relevant Senate subcommittee. At this point the senators are well ahead of the administration; theirs is the most authoritative draft around.

For most of its 21 years, the Clean Water Act was mainly aimed at building new municipal sewage treatment plants and reducing industrial water pollution. The success has been such that most pollution now is the trickier general agricultural and other runoff that comes from so-called non-point sources. In a given watershed there may be thousands of mostly small contributors to such pollution, from dairy farmers to municipal storm sewer systems. Basically this is pollution resulting from land use, traditionally a state and local rather than federal regulatory preserve, and a bewildering array of often private management practices. How to change them, and how to pay the cost?

All sides agree that for flexibility's sake the federal government should operate mainly through the states. But who defines clean and how best to achieve it? What standards does the federal government set, what aid does it offer the states to achieve them and what

sanctions does it apply if they fail? The Baucus-Chafee bill would use more carrot than stick; that seems to be the administration's inclination as well, but this is a question whose answer will lie in the fine print. "Voluntary, targeted approaches should remain the primary focus," the EPA administrator testified the other day, "but backup enforcement requirements . . . are needed when voluntary approaches fail." Where would the administration draw the line?

Resort to the carrot also depends on funding. Most clean water funding over the years has been for sewage treatment plants. The Reagan administration moved in 1987 to phase that out in favor of state revolving funds to which the federal government would make the initial contributions. The Clinton administration now hopes in the name of investment to keep up the contributions, thereby expanding the funds. Baucus-Chafee would do much the same—and both would expand the uses of the funds to combat the broader runoff problem, for which the senators would authorize a special appropriation as well. The trouble is that all these are authorizations only, subject to the tight appropriations caps to which the administration has agreed for the next five years. Ms. Browner also warned that the sewage treatment problem isn't over; cities will continue to bid for available funds. The administrator said that the new legislation needs to be "realistic in light of the resources we can reasonably expect to be available." But "realistic" is also a matter of policy: how much money the president sets aside and fights for in his budget. At some point in the legislative process the administration will need to speak in more detail.

OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR
FROM THE STATE OF MONTANA

Senator BAUCUS. The first of the two problems that we address this morning is municipal water pollution. I think we've made great progress since 1972 dealing with municipal water pollution, but municipalities across the country are still responsible for significant water pollution problems. They are still responsible for inadequately treated sewage, for overflows of raw sewage from combined sewer overflows, and dirty stormwater.

The second problem is the high cost of measures to reduce municipal water pollution. The EPA estimates that there is a \$60 billion backlog of unfunded sewage treatment projects. This doesn't even account for the new projects needed to accommodate population growth and it doesn't account for combined sewer overflows and stormwater. So there's tension. On the one hand, we have to further reduce municipal water pollution, and on the other hand, we have to face up to the cost. This hearing is about resolving that tension.

Let me suggest five key principles. First and foremost, restoration of a full partnership between the Federal Government and State and local governments. Communities have an obligation to solve their pollution problems. The Federal Government has an obligation to help. I believe that the existing State loan funds are the best vehicle for providing this help. I also believe that the Federal contribution should be doubled by the year 2000.

Second, it is not enough to simply spend more money. We also must assure that scarce Federal money is spent more efficiently. For example, some States leverage the revolving loan funds to more than double the number of projects than the funds support. A new Clean Water Act can encourage such innovative financing so we get more environmental bang for our Federal buck.

Third, we must also support innovative pollution control methods. For example, for many years, we have assumed that the only solution to the problem of overflows of raw sewage from combined sewers was to build separate storm sewers and sanitary systems. Today, however, there is a growing recognition that separation is expensive and sometimes unnecessary. Instead, through better management of stormwater, better planning for new development, and better use of existing facilities, we may be able to achieve the same result more cheaply. We must encourage these and other innovative methods.

Fourth, we must acknowledge that effective control of some municipal pollution problems takes time. In some cases, communities may need relief from existing requirements. Combined sewer overflows do demand our attention but the current provisions of the Clean Water Act simply don't fit. We need to revise the Act to allow for development of control plants over a more realistic time frame of up to 15 years.

In addition, we need to reexamine the existing requirements of permits for discharges of stormwater from small communities, especially where receiving waters are not impaired.

Finally, we must respond to small communities that face excessive costs for new water pollution control projects. I've heard from

communities all across my State about this, I daresay that every Senator has heard the same complaints. I know that because I hear them mention them. The existing loan program does not allow States to provide sufficient financial support to these communities and we must revise the Clean Water Act to address this problem, including providing new authority to forgive an appropriate amount of loan repayment.

With these principles in mind, I look forward to hearing from our witnesses.

I'd now like to turn to the ranking member of the committee, Senator Chafee for any comments he might have.

**OPENING STATEMENT OF HON. JOHN H. CHAFEE, U.S. SENATOR
FROM THE STATE OF RHODE ISLAND**

Senator CHAFEE. Thank you, Mr. Chairman.

I congratulate you on that editorial in the Washington Post.

Senator BAUCUS. I congratulate you. It takes two to get this bill together.

Senator CHAFEE. Well, thank you, and it's nice to have a kind word from the Washington Post.

[Laughter.]

Senator CHAFEE. As for Senator Graham being detained at the White House, you indicated I would be here to Chair. Yes, that's quite true. I will not be called to the White House regrettably, so I'll be available to cover.

[Laughter.]

Senator CHAFEE. Mr. Chairman, I have statement I'll put in the record, but I'd like to summarize it briefly if I might.

In 1972, we started to fund the secondary treatment of sewage discharges and since then, we've spent some \$60 billion of Federal grants. Almost all cities are now in compliance with secondary treatment and tremendous improvements in the water quality have resulted.

Now, there are other problems which the Mayor and others are going to introduce—combined sewer overflows, stormwater discharges, nonpoint source pollution and habitat loss—all of which contributes to impairing our waters.

So in 1987 as we looked toward the phaseout of this program, we started the Revolving Loan Program in the States and that's been a big success. In my State, for example, our biggest problem is combined sewer overflows and we recently adopted a plan to spend, if you think of it in our little State, \$467 million, amongst other items, to build a 10-mile tunnel that will capture and store stormwater for treatment before it's discharged into one of the jewels of our State, namely Narragansett Bay.

In addition to that, we've got problems which the Mayor and others will perhaps address. Along the shores of our bay, we have individual septic tanks which have failed, in large numbers I might say, all contributing to pollution in the bay.

So the bill that Senator Baucus and I have introduced would make it possible for Rhode Island and other States to solve problems by using their SRFs to finance needed projects. There's one item in the bill, Mr. Chairman, that does give me some trouble and

I'd be interested in what the witnesses have to say. That's the fact that many small communities have not been able to take advantage of the SRF Program because they cannot afford to repay a loan. So what we've done in here is to allow States to use up to 20 percent of their Federal grant to reduce the amount of loan principle that has to be repaid by disadvantaged communities.

That's a lot of words but what it basically says is 20 percent can go to the small communities to reduce the principal that they have to pay under the revolving fund.

I understand the problem of the small communities—you've got them in your State and I've got them in mine—but I do think we've got to be careful of returning to the old Construction Grants Program where money is just going out in grants. So I'll be interested to hear any comments from the witnesses in connection with that testimony.

Mr. Chairman, I'll put in my entire statement in the record and look forward to hearing from the witnesses.

[Senator Chafee's statement follows:]

STATEMENT OF HON. JOHN H. CHAFEE, U.S. SENATOR FROM THE STATE OF RHODE ISLAND

Mr. Chairman, today the Subcommittee will consider Clean Water reauthorization issues that are of special interest to local governments. Stormwater, combined sewer overflows and the future of the revolving loan fund program are at the top of their list.

As everybody knows, the federal role in financing sewage treatment projects is scheduled to end next year. The authorization for federal grants to create and expand State Revolving Funds expires in 1994. Based on the 1981 and 1987 amendments, most people have assumed that the program would not be extended.

Back in 1981, when we first contemplated an end to federal grants for sewage treatment, we were focused on the mandate in the Clean Water Act that requires secondary treatment sewage discharges. That is a federal mandate dating back to 1972. We were determined to fund that mandate and we have. Sixty billion dollars in federal grants have been made since 1972. Almost all cities are now in compliance with the secondary treatment requirement. Tremendous improvements in water quality have resulted.

But there are other water quality problems—combined sewer overflows, stormwater discharges, nonpoint source pollution, and habitat loss—that continue to impair our waters. The federal interest in solving these problems may be even greater than our original interest in construction of sewage treatment plants.

The State Revolving Fund program we created in 1987 has been a very great success. The states have done a splendid job managing these funds. The SRFs have been so successful that we now hope to use this mechanism to address additional water quality problems.

For instance, in Rhode Island our biggest problem is combined sewer overflows. Recently, Rhode Island adopted a plan to spend \$467 million to build a 10-mile tunnel that will capture and store stormwater for treatment before it is discharged into Narragansett Bay. In addition, we have many areas along the shores of the Bay where individual septic tanks have failed in large numbers and are now a major source of pollution. The bill that Senator Baucus and I have introduced would make it possible for Rhode Island and other states to solve problems like these by using their SRFs to finance needed projects.

There is one item in the bill, the proposed assistance to small communities that we included for discussion purposes, that gives me particular concern. Many small communities have not been able to take advantage of the SRF program because they cannot afford to repay a loan. The proposal in S. 1114 would allow states to use up to 20% of their federal capitalization grant to reduce the amount of loan principal that has to be repaid by disadvantaged communities. I am not opposed to special help for these communities, but I do worry that this proposal puts us on the verge of returning to the old construction grants program.

My suggestion is this. Instead of using federal dollars for grants, we should encourage states to provide assistance to disadvantaged communities out of funds ap-

propriated by state legislatures. If a state sets up a grant program, we could count their efforts toward the matching requirement for the federal grant. The matching requirement is 20% so small communities would get the same amount of assistance. I fear that if we offer federal funds to meet the needs of small communities directly, we won't be able to hold the line at 20%. We may be putting the very concept of revolving funds at risk by suggesting that federal funds can once again be used for grants.

Mr. Chairman, I have reviewed the testimony of the witnesses and I am pleased to say that it is quite supportive of our bill. One hears constantly about the problems that cities are having with federal mandates and environmental regulations. I hope that we have started to turn the corner on that problem with the stormwater and CSO provisions included in this bill.

Senator BAUCUS. Thank you very much, Senator.
Senator Faircloth?

**OPENING STATEMENT OF HON. LAUCH FAIRCLOTH, U.S.
SENATOR FROM THE STATE OF NORTH CAROLINA**

Senator FAIRCLOTH. Thank you, Mr. Chairman.

I want to thank Chairman Graham in his absence for his leadership in this year's reauthorization of the Clean Water Act.

I might have to leave a few minutes early before I get to my questions. If I do, I want to submit them for the record. I'll be going to the Banking Committee, not to the White House.

[Laughter.]

Senator FAIRCLOTH. The Clean Water Act is one of our most successful environmental laws. The Nation's waters are cleaner today than anytime in the recent past. I want, as a member of this committee, to build on their success with responsible legislation targeted to correct the most vital remaining water quality problems in a cost effective manner.

As far as today's subject, I am pleased with parts of the bill and less pleased with all of it. I would like to have some more flexibility built into S. 1114 for encouraging public-private partnership for the construction and ownership of municipal water plants. I think the taxpayers will ultimately benefit if we encourage private sector ownership and operation of traditional government services.

I am pleased to see the effluent provisions for stormwater from last year's bill was lifted and replaced with more reasonable guidelines based on management practices. I am concerned with expanding the eligibility for State revolving funds for combined sewer overflows if that means a new formula that will short change States with modern sewer systems.

North Carolina has virtually no combined sewage overflows, Senator Chafee, because our systems are newer and more modern and therefore we have no overflow. I don't think we should be penalized in future formulas because that is not one of our problems.

More importantly, I would like the assurance of the administration that the expanded funding for State revolving funds is absolutely justified in light of the ballooning Federal deficit.

I think we should only be spending money for a national emergency and I'm not sure that the expansion is justified on the basis of a national emergency. Perhaps the sewer problem does constitute an emergency, but I have my doubts.

I'll look forward to the committee coming through this year with a common sense Clean Water bill, one in which taxpayers, municipi-

palities, and industry and the environmental groups can all find some common ground.

Thank you, Mr. Chairman.

Senator BAUCUS. Thank you very much, Senator.

I'd now like to introduce the first panel. They include: Donald Fraser, Mayor of Minneapolis—very good to see you, Don; Mr. Greg Smith, Chairman, Municipal Assistance Task Force from the Ohio Environmental Protection Agency, Columbus Ohio; Mr. Edward Wagner, Deputy Commissioner, New York City Department of Environmental Protection; Mr. Bob Adler, representing the Natural Resources Defense Council; and Ms. Martha Prothro, Acting Assistant Administrator for Water, U.S. Environmental Protection Agency.

Before I have you speak, I'd like now to introduce some visitors from Russia at the request of Mayor Fraser. I'd like you all to stand, please, when I mention your name.

First, we have Konstantin Nikulin, who is General Secretary of the Union of Russian Cities; Valery Kirpitchenkov, President, URC, a Member of Parliament; and Vladimir Varnavsky, Omsk Council Chairman, URC Board. Welcome to the United States.

Apparently they are visiting and Mayor Fraser can explain in more detail precisely the nature of the program. Why don't you do that, Mayor, before you begin your testimony?

Mayor FRASER. Thank you very much, Mr. Chairman.

Thank you for introducing our guests. They are the leaders of the Union of Russian Cities, an organization which is a counterpart to the National League of Cities in the United States. This is our first formal meeting. They were organized about two years ago and we're looking forward to exchanges, to provide technical assistance, and to learn from one another.

Senator BAUCUS. That's very good.

I'd like to tell each of the witnesses that your full statements will be included in the record. You'll have 5 minutes to summarize your testimony.

Why don't you begin, Don?

Senator CHAFEE. Mr. Chairman, I'd just like to join in the welcome to the friends from Russia and say we're glad they are here.

I'd also like to say, Mr. Chairman, that I believe I'm correct that one of Mr. Donald Fraser's predecessors as Mayor of Minneapolis was Hubert Humphrey.

Senator BAUCUS. That's right.

Senator CHAFEE. So what lies ahead for you?

[Laughter.]

Mayor FRASER. My first political job was as an office boy in his campaign for the United States Senate in 1948.

Senator BAUCUS. Thank you very much. Why don't you proceed, Don?

STATEMENT OF HON. DONALD FRASER, MAYOR, MINNEAPOLIS, MINNESOTA, REPRESENTING THE NATIONAL LEAGUE OF CITIES

Mayor FRASER. Thank you, Mr. Chairman and members of the committee.

I am Don Fraser, Mayor of Minneapolis and President of the National League of Cities. I'm here to testify on behalf of the National League of Cities and the 16,000 cities and towns across the country that we represent on Senate 1114, the Water Pollution Prevention Control Act of 1993.

My remarks will be quite brief and I've tried to summarize the high points in my longer statement.

We're very pleased that both Senators Baucus and Chafee have taken the critical first step toward restoring our governmental partnership that the Chairman referred to. We think that is essential if we are to accomplish our mutual national environmental objectives.

The priority Clean Water Act issues for our cities in the country are substantially addressed in your proposal—clarification of congressional intention, revisions of the Stormwater Management Program, revision of the requirements for addressing pollution from combined sewer overflows and a continuing Federal financial commitment to municipalities to assist in implementation of the Clean Water Act requirements.

The other issue in which we have a vital interest is how you resolve the current conundrum on wetlands and we look forward to reviewing that proposal when it is completed.

The Stormwater Program has been a major issue for the National League of Cities for over 10 years. We've been to the Congress three times on this issue over the past several years, seeking and obtaining delays in implementation of the program for the Nation's smaller cities and towns. The bill pending before you at long last begins to address the real issues facing municipalities in implementing the Stormwater Program.

What we believe has been poorly understood is that no one, not EPA, not the Congress, nor the environmental community, has ever made a credible case to municipal officials that urban stormwater runoff is a priority problem deserving the investment of millions if not billions of scarce local dollars. We've not been convinced that pollution from urban runoff is an issue that can be addressed effectively regardless of the resources invested; nor do we believe that municipal stormwater is the major contributor of what, in effect, is a nonpoint problem of ongoing pollution in our rivers and streams.

For NLC, the bottom line on the stormwater amendment is no end-of-pipe requirements and Senate 1114, at least for the foreseeable future, provides municipalities with that absolutely essential relief.

The provision in your bill that imposes a 10-year moratorium on numerical effluent limits and water quality standards cannot be amended or deleted. You've taken an important step in the right direction and from our perspective, it is not negotiable.

It is also important for you to understand that while the provisions in 1114 are a vast improvement over where we are now, the alternative is not without significant cost. The recent estimates indicate that even the least costly strategies to control pollutants and urban runoff will cost municipalities over \$1.1 billion a year. That represents an average cost of half a million dollars a year for the cities that will be required to implement a stormwater manage-

ment program. The CCMA guidance goes far beyond these least costly strategies.

We would like to recommend several revisions to your proposal. First, we would like to see an amendment to the current regulations which require municipal industrial facilities, such as municipal garages, sewage treatment plants and airports, to obtain individual permits. These facilities should be incorporated within the system or jurisdiction wide permit.

Second, we propose that you dedicate some Federal resources to finding the techniques that will accomplish the objectives of a stormwater management program. We would propose you consider a set aside from the SRF appropriations for a research program to help develop effective stormwater management strategies and programs.

Third, we recommend that you incorporate a legislative role for local officials in the rewrite of the CCMA guidance as it applies to municipal stormwater programs.

The Baucus-Chafee measure is, again, a significant step in the right direction and while we are disappointed that no Federal funds are made available for grants to municipalities, the bill does, in our opinion, demonstrate a renewed Federal commitment to meeting Clean Water Act needs by reauthorizing funds for the SRF, by providing for grants to distressed communities regardless of size and by expanding the pollution control activities eligible for financial assistance.

Mr. Chairman, that is essentially a summary of my longer statement which I understand will be a part of the record.

Senator BAUCUS. Thank you very much, Mayor.

Next, Mr. Smith?

STATEMENT OF GREG SMITH, CHAIRMAN, MUNICIPAL ASSISTANCE TASK FORCE, OHIO ENVIRONMENTAL PROTECTION AGENCY, REPRESENTING THE ASSOCIATION OF STATE AND INTERSTATE WATER CONTROL ADMINISTRATORS

Mr. SMITH. Good morning, Mr. Chairman, Senator Chafee, and members of the committee.

I'm very pleased to be here this morning to address you. You have a written statement, I believe, which incorporates our comments. I'm not going to attempt to summarize all of those but there are a few major points I would like to emphasize this morning.

At the outset, I'd like to say that the comments I'm going to make may raise more questions than provide answers for you but it's our intent to let you know some of our concerns so that we can begin a dialog over the next few months and work toward the best win-win situation on the bill that we can.

I'm here representing the Association of State and Interstate Water Pollution Control Administrators. Our association believes that we need to build upon Clean Water Act successes of the past, but also while we make improvements to the Act, we need to ensure that we don't jeopardize the benefits that we've already achieved.

Many of the programs that have already been developed have been very successful such as the State Revolving Loan Fund and

we want to ensure that those continue in the same manner of effectiveness and efficiency that they have. The newer programs, such as the Stormwater Program and the Combined Sewer Overflow Program are going to require a good deal of dialog to work out the details.

With regard to the State Revolving Loan Fund, we believe that the States have been very successful in broadly fulfilling their part of the 1987 covenant which established the SRFs. As you remember, that was a move from the Grants Program into the State Revolving Loan Program.

We believe it is worthwhile to remember two basic tenets of that 1987 covenant. One was that adequate funding would be available to replace the Construction Grants Program and allow the SRFs to broaden the role of a Federal-State partnership in financial assistance. The second is that the States are to be afforded maximum flexibility in developing their State programs and the assistance mechanisms to meet the unique Clean Water Act needs of their individual circumstances. We would like to respectfully remind the Congress that both of us need to keep in mind our various responsibilities in that covenant.

In the area of appropriations, we believe that the record is clear, the appropriations from the original 1987 authorized amounts for the SRF loan are \$1.7 billion short to date and currently, the States stand in the shadow of a reduced appropriation for fiscal year 1994.

At the same time, the Clean Water's eligibilities have been dramatically expanded since the 1987 covenant, but the funding commitment to date has not. We believe it is key to the successful administration of the SRFs that the States must have confidence, that adequate and predictable levels of funding will be available to address the traditional and the new Clean Water Act needs. The current proposal expands eligibility without concomitant increases in appropriations. Another concern is that grants to individual cities and set-a-sides continue to divert funds that could be appropriated to the SRF. Since 1987, we have been left with the impression that the SRF receives what remains after the special grant projects have been funded from the appropriation.

We believe that the Congress needs to reaffirm its commitment to a proven program, such as the State Revolving Loan Fund, and authorize appropriate and adequate levels of funding. This funding commitment would allow States to be less conservative in planning their cash flows and, in all likelihood, may well increase the willingness of some States to leverage their funds to provide even more assistance at any given point in time.

The other area of principal concern to us is the ability of the States to have flexibility to manage their SRFs. One of the most desirable characteristics of the SRF is the ability of State pollution control agencies and the State financing authorities to be innovative in developing mechanisms to assist in achieving the Act's objectives. There is much emphasis placed on innovative technologies and what's been happening in the intervening years since 1987 is that the States and State financing authorities have been hard at work to develop innovative financing mechanisms to go along to complement technological advances.

We believe that some of the refinements that are proposed in the current bill, while they are grounded in desirable policy objectives, we are concerned that they may impair the States' ability to continue the creative work that we are now pursuing in carrying out the Act.

Without going into detail, some of the provisions that we are concerned about are the 200 percent binding commitment requirement, the expansion and contraction of eligibilities and permitted types of assistance. In particular, we're very unclear about the intent of the proposed section 603(c)(2)(A). We are concerned about the recreation of a grants program which would operate outside of the SRF. We are concerned about the loan forgiveness provisions that are proposed for disadvantaged communities. We are concerned about the limited number of changes to facilitate the small, hardship and rural community funding.

Senator BAUCUS. I'm going to have to ask you to summarize, Mr. Smith.

Mr. SMITH. With regard to combined sewer overflows, we applaud the direction the committee is moving in that area toward implementing the national policy. The specifics on our comments on that proposal are contained in my written testimony.

As far as the Stormwater Program is concerned, we are very worried about an excessive or large number of permits coming into being all at the same time and overwhelming a State's capability to monitor and ensure water quality improvements as opposed to issuing permits exclusively.

In closing, we are very interested in working collaboratively with the committee and the staff over the next few months.

Senator BAUCUS. Thank you very much.

Mr. Wagner?

**STATEMENT OF EDWARD WAGNER, DEPUTY COMMISSIONER,
NEW YORK CITY DEPARTMENT OF ENVIRONMENTAL PROTECTION,
REPRESENTING THE ASSOCIATION OF METROPOLITAN
SEWERAGE AGENCIES**

Mr. WAGNER. Good morning.

I'm pleased to be here today to provide AMSA's perspective on the reauthorization of the Clean Water Act and the recently introduced Water Pollution Prevention and Control Act of 1993, Senate 1114. We appreciate this opportunity to share our thoughts and recommendations as environmental practitioners dedicated to protecting and improving the quality of the Nation's waters.

AMSA supports the reauthorization of the Clean Water Act and its goal of fishable and swimmable waters. Let me outline AMSA's vision for this reauthorization.

We believe the reauthorization must provide an integrated and comprehensive strategy that allows setting appropriate priorities for achieving water quality goals. It must recognize the wide range of conditions present in our Nation's watersheds and provide flexibility to decisionmakers so that they can address site specific needs. It must target all impediments to ecosystem health. It must develop mechanisms for control that properly balance environmen-

tal gains and their cost effectiveness. It must provide the funding to implement its clean water mandates.

While this is AMSA's vision for the reauthorized Clean Water Act, we also acknowledge in our initial review of Senate 1114 that the Senate legislation goes a long way toward the realization of these principles and we commend Senator Baucus and Senator Chafee for introducing this legislation that clearly moves the Clean Water Program forward.

AMSA has recently initiated a detailed review of this bill and will be reporting on specific comments and recommendations to the subcommittee in the coming weeks.

It is important to put reauthorization of the Clean Water Act into an historical perspective. The Nation, its States, cities and towns have made enormous progress in the 20 years since the passage of the 1972 Act. Back then, national standards that targeted point sources made sense because we had huge problems, much of which were traceable to easily controlled sources. Congress provided funding, deadlines and enforcement tools. Coupled with great public support and motivation, this set the stage to successfully address many of our clean water challenges.

Today, the problems are different and so must be the solutions. While public support for environmental progress and improvement continues, the remaining clean water issues we must address are much more complex and costly.

The control of combined sewer overflows and the management of stormwater and nonpoint sources of pollution exemplify the dilemma of how to fund major priorities in the face of unprecedented fiscal shortfalls at every level of government.

Today, we must find a way to reconcile the constraints of the 1990s with our continued high expectations and the need to make continuing progress. Reconciling constraints with expectations within the context of a reauthorized Clean Water Act will involve several things.

The first is an increased and ongoing Federal financial commitment to funding clean water mandates. Attached to my testimony is a report AMSA has published called, "The Cost of Clean." Among the key findings of the report are the following. Funds totaling over \$23 billion will be required for AMSA member agencies alone to meet currently mandated clean water needs to the year 1995. We can expect operation and maintenance costs which are paid totally by local government to double every 8 years. Historical data allows us to project that annual household user fees will double every 6 years and that currently, local governments pay 80 to 90 percent of the "Cost of Clean".

I believe that we, my colleagues on this panel, and the members of the distinguished committee should work together to ensure Federal resources are forthcoming. We must not lose sight of the fact that the Clean Water Act sets forth a national program with an integral relationship to our Nation's long-term environmental health and economic growth.

We are all impatient to aggressively restore our Nation's water environment. AMSA's long-term funding position calls for a \$6 billion a year Federal commitment based upon what we believe is an accurate reflection of the funding needs to effectively meet existing

requirements. Plainly stated, Federal support is essential if we are to meet the clean water challenges we face as a Nation.

In my testimony, I talk about the support that we have for the provisions regarding combined sewer overflows. In this national policy, that was developed through collaborative means, national direction is coupled with sufficient flexibility to consider site specific variables and it is welcomed as a solution to a complex problem.

Some of my colleagues on this panel will have much more to say than I concerning the approach to the issue of stormwater management, but AMSA would like to speak in support of the draft bill's recognition of the effectiveness of best management practices and endorses the legislation's movement away from the requirement of numeric water quality limits in stormwater permits.

Last, let me comment that praise and support are deserved for the attention paid in Senate 1114 to many longstanding programs, as well as the important areas of pollution prevention, water conservation and what we are convinced must be the future direction of our Nation's clean water program, comprehensive watershed management. We will be submitting additional testimony at a future hearing on that subject.

In conclusion, let me suggest the following. We need to consistently search for better ways of doing things and to AMSA that means more flexibility and more attention to site-specific variables; a better public awareness of what the problems are, the importance of solving them, and the best solutions.

Local consensus building must become an essential step in the framework for reaching the environmental milestones we've set. We must strive toward implementation of the most effective, pragmatic means through which we can accomplish our national clean water goals. There has to be a measurable and meaningful return for our investment.

Senator BAUCUS. I have to ask you to summarize, please.

Mr. WAGNER. We all recognize that we have a long way to go. However, by working together, I know we can succeed. We look forward to working closely with the subcommittee and I'd be pleased to answer any questions you might have.

Senator BAUCUS. Thank you very much.

Mr. Adler?

STATEMENT OF ROBERT ADLER, SENIOR ATTORNEY, NATURAL RESOURCES DEFENSE COUNCIL

Mr. ADLER. Thank you, Mr. Chairman.

I'm a senior attorney and Director of the Clean Water Program at NRDC. I also chair the Steering Committee of the National Clean Water Network which has more than 420 groups around the country working together to strengthen the Clean Water Act. Behind me today is Diane Cameron, an environmental engineer at NRDC to answer any technical questions about stormwater.

We agree that significant progress has been made in the past 20 years in reducing pollution from municipal sources, yet municipal pollution does remain among the most daunting challenges facing Federal, State and local water quality officials at a time when fiscal resources are increasingly scarce.

I'd like to begin by supporting increased Clean Water Act funding both for SRF and for State, Federal and Tribal water quality operating programs. I believe the public will support this spending.

According to a 1992 Roper Poll, water pollution topped the list of the most serious environmental problems experienced by the American public, with 77 percent of respondents agreeing that water pollution is a severe problem and 79 believing that our current water pollution programs do not go far enough to solve these problems. If more Federal dollars are spent on water pollution control, the public must be assured that it's getting more environmental protection, not less, for its money.

Included in our testimony are two ways that we can make sure that our Federal dollars are spent more wisely and more efficiently. The first is least cost water planning. Simply put, water conservation is dollar conservation. Many of the capital and operating costs of wastewater collection and treatment are closely related to the amount of water flowing through the system. If it's cheaper to save water than to supply it at the front end or to save it at the back end, that's a wiser Federal investment than building new treatment capacity and new supply capacity. That ought to be considered in the mix.

Second is targeting funding to the National Estuary Program and similar watershed management-based programs around the country. Our written testimony addresses some of the problems with NEP. Senate Bill 815, introduced by Senators Lieberman, Dodd, Moynihan and D'Amato, would increase NEP funding contingent on the resolution of many of these problems, but the basic approach is to try to target more money to projects that are identified in sound watershed management plans so long as there is assurance that those programs are implemented.

For similar reasons, it is critical for us to seek solutions to stormwater and CSO problems that are cost effective but without turning our backs on the severe human health and environmental problems caused by those releases.

For those reasons, NRDC and other environmental groups worked closely with AMSA, ASWIPCA, and the National League of Cities last year to negotiate a rational framework for resolving CSO problems in a cost-effective way, and were extremely pleased to see that framework is included by reference in Senate Bill 1114.

With due respect, however, we were disappointed to read that the approach to stormwater control in Senate Bill 1114 undercuts rather than supports ongoing efforts to negotiate a rational, cost effective solution to stormwater pollution around the country.

We have quite a detailed recitation of stormwater problems around the country in our written testimony. I'd like to summarize the four most salient points.

I think the largest point of disagreement we would have with the National League of Cities is that stormwater pollution problems have been well-documented around the country over the years. I think members of this committee, including Senator Chafee, recognized in 1987 that stormwater is a severe problem.

Studies conducted by NRDC in cities around the country found that total pollutant loadings from urban stormwater rivals and in many cases exceeds loadings from factories and sewage treatment

plants. According to EPA's 1992 "Study of Urban Stormwater Discharges", while urban population areas make up only 2.5 percent of our land area, they contributed to 18 percent of the impaired river miles, 34 percent of the impaired lake acres and 62 percent of the impaired estuarine miles identified under section 319(a) of the Clean Water Act. Clearly, urban stormwater runoff is a major source of pollution for U.S. waters.

The distinguished Mayor talked about delays in the program over the past 3 years. I would refer you to page 22 of our testimony which documents the continuous delays in the Stormwater Program since 1972. The delays have been requested again, and again, and again, and the time has come for a rational, cost effective solution to stormwater problems that doesn't turn our backs on urban water quality around the country.

We do not believe that Senate 1114 addresses those problems. It would exempt most cities under 100,000 from the Stormwater Program. I'd like to emphasize that I'm not talking only about small, rural communities. We are talking about the largest growing suburban areas—the suburbs of New York, Philadelphia, Cleveland, Detroit, Cincinnati, Los Angeles. These are the largest growth areas in the country. They are the areas where we have the most bang for the buck in terms of investing in stormwater control programs.

EPA's data show that it is far cheaper to address stormwater pollution at the front end than to wait until after development has occurred and then face the serious costs and the serious flood and water quality problems that occur due to stormwater.

We would ask you to reconsider Section 402 of Senate 1114. Give us the opportunity to work with the cities on stormwater as we have on combined sewer overflows and to try to work out a reasonable approach, a cost-effective approach that does not send the message that we are willing to write off water quality in urban areas around the country.

Thank you.

Senator BAUCUS. Thank you very much, Mr. Adler.

Ms. Prothro?

STATEMENT OF MARTHA PROTHRO, ACTING ASSISTANT ADMINISTRATOR, OFFICE OF WATER, ENVIRONMENTAL PROTECTION AGENCY, ACCOMPANIED BY MICHAEL COOK, DIRECTOR, OFFICE OF WASTEWATER ENFORCEMENT AND COMPLIANCE

Ms. PROTHRO. Good morning, Mr. Chairman, members of the subcommittee.

I'm Martha Prothro, Acting Assistant Administrator for the Office of Water at EPA. With me today is Michael Cook, Director of our Office of Wastewater Enforcement and Compliance. He is an expert on municipal wastewater issues.

Since last week when Administrator Browner testified before the subcommittee, we've had a chance to look at Senate Bill S. 1114 more carefully and we wish to express our general support for the direction of the bill and many of the detailed provisions. While we have a few differences with the bill, we're very optimistic that this can be the vehicle for reauthorization that the administration can

support. I'm just going to summarize briefly some of the specific positions that we are able to relay to you today.

First, with regard to the SRF, the administration supports a strong Federal commitment to capitalization of the SRFs. However, the President's long-term vision is for \$2 billion per year from 1995 through 1998 and this is \$5 billion less than the bill authorizes over the four-year period.

We do support lifting the restriction on sewer project funding so that CSOs and stormwater projects can be more readily funded. We also are considering the merits of allowing SRF funding for water use efficiency, water conservation and pollution prevention. We think these are good ideas.

We support the principal purpose test to restrict eligibility to those projects intended for water quality improvement. We're very interested in the idea of expanding State priority lists to include nontraditional projects such as nonpoint source and stormwater management so it is more likely these projects would be funded.

We're very concerned about the plight of disadvantaged communities that have had disproportionately high per capita wastewater treatment costs. As you know, we've proposed in the short term a \$100 million program in fiscal year 1994 for cities with high needs and user fees. Boston would qualify on this basis.

The President has also requested for fiscal years 1994 through 1997 more than \$2.4 billion in grants and \$3.9 billion in loans for rural communities as part of the Rural Development Administration's program for wastewater treatment. We're examining whether further Federal assistance would be appropriate.

EPA is concerned, however, about the total amount of set-asides allowed in S. 1114 and the long-term effect of these set-asides on the revolving nature of the SRF.

Finally, with regard to the SRF, we agree that the allotment formula does need to be updated. We believe it should be done in a legislative context.

With regard to permit fees, we support the establishment of a permit fee program, perhaps modeled on the Clean Air Act to help both the States and the EPA defray the costs of permit issuance, enforcement, monitoring and related program activities.

With regard to combined sewer overflows (CSO), we expect to publish our final CSO policy in October of this year, culminating many months of negotiation and public comment. The proposed CSO policy received widespread public support and we believe legislation on this subject will be unnecessary once the policy is final. In fact, we plan to move quickly now to implement the policy without awaiting legislative direction on CSOs.

With regard to stormwater, we would likewise like to proceed with implementing Phase I of the Stormwater Program without a loss in momentum. However, we do recognize the difficulty cities face in implementing their local programs and we believe a delay in applying the numeric water quality standards would be reasonable. We would also support authorization for cities to issue NPDES permits to dischargers to their storm sewers where they are willing and able to do so.

We believe the Phase II stormwater sources generally should be handled under a strengthened nonpoint source program, except

perhaps in urbanized areas. We'd like to work with you further on that.

That concludes my abbreviated summary statement.

Senator BAUCUS. Thank you very much, Ms. Prothro.

I'd like to focus a little bit on stormwater if I could and Mr. Adler, first with respect to communities under 100,000, does the environmental community think there should be some relaxation for the requirement for permits for stormwater discharge for communities under 100,000 or not?

Mr. ADLER. We think the program needs to be revised so that it works better. That doesn't necessarily mean that you exempt cities under 100,000 from permits. We would like to talk about things like general permits for cities under 100,000. I went to the National Flood and Stormwater Management Agency Conference in Sacramento in December and the problems that I heard were with the permit application process where they were spending a large amount of money to go to consulting firms simply to fill out the paperwork.

Now that we have experience with the Stormwater Program from the larger cities, let's talk about a general permit for smaller cities so that they can spend their limited dollars on the ground controls rather than paperwork.

Senator BAUCUS. What about that, Mr. Fraser? Is it more paperwork, but no relaxation in permit process as long as it's a general permit?

Mayor FRASER. My understanding is the paperwork problem has been formidable. I understood that the proposed legislation does apply to smaller communities if they are part of an urban area. I didn't see that there was a wholesale exemption of the communities under 100,000 but I may be reading the Act inappropriately.

Senator BAUCUS. Is there some agreement on the degree to which permits are required for communities under 100,000? That is what I'm trying to determine, or is that just an irresolvable issue at this point?

Mr. ADLER. Perhaps we should talk about density rather than population size. The National Urban Runoff Program found that all areas with a density of approximately 640 persons per square mile, which is roughly one person per acre, were similar in their stormwater impacts. Small cities with a low density perhaps could get a break from the Stormwater Program, but what disturbed us about EPA's implementation of Phase I and S. 1114 as we read it is that geographically contiguous, densely populated areas, which form the rapidly growing suburbs of the major cities in the country will continue to be exempt from the Stormwater Program. These are precisely the areas that are in most need of stormwater control.

Senator BAUCUS. Let's move to those communities above 100,000. The bill essentially relaxes the water quality standards and discharge for five year periods but in their place requires best management practices. Is that a provision that you and the conservation community can agree with?

Mr. ADLER. We don't agree with the bill in three principal respects. One is the exemption of cities below 100,000, especially the contiguous communities. Two is relaxation of the substantive re-

quirements for stormwater that rely on the CZMA guidelines which are good in principle but lacking in substance, lacking in firm, enforceable, accountable requirements to ensure that Philadelphia does approximately the same thing as New York city does for their stormwater.

We agree that there ought to be flexibility in stormwater programs. Each city is different, but there ought to be some substantive accountability so that the public has the assurance that if they are spending money on stormwater control, they are getting their money's worth. That's the second major area.

Senator BAUCUS. Mr. Fraser, you say the cities need a little help, what's your answer to Mr. Adler?

Mayor FRASER. Our main interest has been to get rid of the numerical requirements. I think that's the most important issue from our perspective.

Exemption for the smaller communities we thought made sense, but I'd have to confess to you that my reading of the bill is probably not—

Senator BAUCUS. What about the water quality standards at discharge during the two five-year permit periods and substituting best management practices in the interim? Is that needed from the cities point of view?

Mayor FRASER. I'm a little hesitant to speak for the smaller cities.

Senator BAUCUS. I'm talking about the larger cities now, those over 100,000.

Mayor FRASER. Those over 100,000, as long as we get rid of the numerical discharge requirements, those are postponed I think for 10 years, we're okay.

Mr. ADLER. We're willing to talk about the numeric, end-of-pipe effluent limits if they are replaced with something meaningful. Right now, the CZMA guidelines do not provide us with anything meaningful that assures us that sound programs are in place.

Senator BAUCUS. One final round of question although my time has expired and I'll be leaving.

Ms. Prothro, your statement was a bit vague on support to small communities. Does EPA support forgiveness of some amount of loans for needy communities or grant assistance or what?

Ms. PROTHRO. The Administration is continuing to examine the possible approaches for needy cities. For small communities, however, the request that the President made for additional funding for both grants and loans from the Rural Development Administration is the answer, we believe, for the long term. There is a considerable increase there for communities that are in rural areas below 10,000 and SRF assistance does provide considerable subsidy in and of itself. Given that it can be provided at zero percent interest, it is in essence a 40 percent grant subsidy over a long term.

Senator BAUCUS. I'd just encourage the administration to look, not only at Boston, but also at smaller communities. They are both needy. It is true the Boston Harbor is needy, there is no doubt about that but Boston itself is needy, but it is also true there are small communities that are equally stressed. I encourage the administration to work with the Congress to find a solution to that problem as well.

Senator Chafee?

Senator CHAFEE. Mr. Chairman, I note that two of our colleagues have joined us, Senator Kempthorne and Senator Durenberger. If they have statements, now would be a good time. I know that Senator Durenberger wants to greet his fellow Minnesotan.

**OPENING STATEMENT OF HON. DAVE DURENBERGER, U.S.
SENATOR FROM THE STATE OF MINNESOTA**

Senator DURENBERGER. Thank you very much.

I express to you and the Chairman my regrets on not being here earlier, and to the members of the panel as well. We were marking up the clinic access bill.

When I think back to the last reauthorization of the Clean Water Act, the one we completed in 1987, the issues that I recall most clearly are the formula for the SRF grants, nonpoint source pollution, and stormwater permits. While reviewing the materials for this hearing, I can see that participation in the last reauthorization will prove beneficial as we work on this new bill. The issues are still the same.

S. 1114 would substantially reduce the portion of SRF dollars that get allocated to my State of Minnesota. All of the States of the Great Lakes region, with the exception of New York, would be losers. Hundreds of millions of dollars now allocated to water quality projects in the Great Lakes would be redirected to other regions of the country. Mr. Chairman, these are the same points I made when the clean water bill was last reported out of this committee.

I called the SRF formula in the bill reported by the committee in 1985, the moral equivalent of the lamprey eel. That bill brought a filibuster on the floor from other Great Lakes Senators and it was uniformly opposed by House members in the conference and completely overturned and the conference restored with the minor modifications. The formula was written in 1981.

One can draw some lessons, I hope, from that experience. No one will deny that the distribution of the dollars among the States would change as needs change but formula changes that have no foundation in policy are likely to fail. The SRF formula proposed by this committee in 1985 was nothing more than a blatant grab for bucks with no policy justification.

For instance, I recall that one of the factors in that formula was the inverse of the cube root of some obscure EPA statistic. Formulas like that will just not pass for policy.

I'd like to work with the leadership on this committee and I compliment both the Chair and the ranking member as strongly as I can for their work in getting this bill before us. I'd like to work with you to assure that the distribution of SRF dollars is fair and justified in all cases by good policy considerations.

I will recognize the need for change but I also expect that changes that reduce the money coming into my region of this country will only occur if they are going to meet more pressing water quality problems elsewhere.

Senator Chafee [assuming Chair]. Senator Kempthorne, did you have statement?

Senator KEMPTHORNE. Mr. Chairman, this is a very, very important issue that we will be dealing with and so I too have questions that I will be posing to the members of the panel and would just note that I was a bit late because of conflict of schedule with the Armed Services hearing. I'd note that there is a Senate Reform Committee that has been taking testimony on suggested reform and I intended to appear and testify on the frustrations of conflict of schedule, but I had a conflict of schedule.

Senator CHAFEE. I must say it's very nice having Senator Kempthorne on this committee because, as everyone knows, he has dealt with these problems firsthand as a Mayor of a large city, so we are delighted to have your expertise here.

Let me ask the panel about Davis-Bacon. As you know, any time the Federal Government provides monies we impose mandates that require adherence to the Davis-Bacon Act which means paying salaries at the so-called prevailing wage which, in nearly all instances, is considerably higher than otherwise.

Mr. Smith, in his testimony suggests we repeal Davis-Bacon mandates so that we can get more accomplished with the same dollars. How do you feel about this, Mayor Fraser?

Mayor FRASER. Our organization has favored the repeal of that Act.

Senator CHAFEE. Mr. Adler, I suppose you're not involved in this?

Mr. ADLER. That's correct.

Senator CHAFEE. Mr. Wagner?

Mr. WAGNER. Speaking for AMSA, we don't have a position on that subject, Senator, so I can't really respond. However, coming from New York, I would offer the opinion that there are many other restrictions and requirements in the SRF program that we think should be looked at as well that are onerous and really preventing people from getting these loans in an expeditious way.

Senator CHAFEE. Ms. Prothro?

Ms. PROTHRO. We have not supported a change in the general applicability of Davis-Bacon, but we have been looking at whether or not it would be appropriate to provide some kind of an exemption for smaller communities. So we'd like to work with you on that.

Senator CHAFEE. Mr. Adler, back to this subject of stormwater and the permits that would be required. Here is the situation as we looked at it. You devoted a lot of attention to stormwater. If that were the only question, we might well agree with you but here is the situation. We've got a whole series of unresolved water quality problems—nonpoint pollution from farm runoff, wetlands protection, combined sewer overflows, habitat loss, discharge of pollutants that bioaccumulate in the food chain.

When you look at the water quality problems, stormwater wouldn't seem to be the highest priority. The problem, under what you're suggesting, is the reallocation of efforts under the Act and resources likewise. Let me give you a little illustration and Mayor Fraser has addressed this.

It's my understanding that it cost 180 cities under this \$140 million just to prepare their applications. We thought that is a lot of money. That is the paperwork matter that the Mayor and Ms. Prothro were addressing. It seemed to me that the approach we

took was a better one, particularly for the smaller cities under 100,000 and they follow a plan.

It isn't that they are let off scott free but they come forth and they say what they are going to do—they are going to sweep their streets x times a year; they are going to make these various efforts—and that's the way we approached the thing. Yet you would have these permits, whether they are general permits or specific permits, it's a whale of a paperwork problem.

Mr. ADLER. If I may disagree with your first point and agree with your second point, we disagree that stormwater is not a priority problem. Again, I'll refer to EPA's data—these are not our data—that 2.5 percent of the land area, 18 percent of the impaired river miles, 34 percent of the impaired lake acres, 62 percent of impaired estuarine areas are identified under the nonpoint source assessment. So nonpoint source pollution polluted runoff is a major remaining water quality problem but polluted urban runoff is a large percentage of that pollution and we need to address that if we are to restore the health of our urban waters, lakes and estuaries around the country.

I do agree with you that we should not be spending more limited resources on paperwork than on-the-ground control, which is why we propose we look at things like general permits for smaller cities or countywide permits for areas so that you don't have 50 smaller communities apply for separate permits rather than a countywide permit, taking advantage of economies of scale to address the problem.

So let's figure out a way to address the problem cost effectively but not turn our back on the problem altogether.

Senator CHAFEE. We wouldn't think we were turning our back on the problem.

Another thing that bothers me about all of this, and we talk about it, but I'm not sure we do much about it. Mayor Fraser, maybe you can say something about it. Is any innovation being undertaken in connection with solving these problems? You're always talking such big dollars that no one dares branch off and try something new because if it doesn't work, you've sunk a lot of money into a failure. Are you familiar with innovative steps that are being taken in handling any of these problems?

Mayor FRASER. Senator, I'm not technically up-to-date. I don't follow some of the efforts that cities have made to deal with this problem. I wanted to note in connection with what you were saying earlier, since I've been Mayor for over a decade, we've faced recurrent financial crunches and there has been the need to cut spending.

One of the things we did is we cut street sweeping. We used to sweep our streets three times a year in our city. We went down to two because it was one of the places we could save money. Our estimate is it is going to cost us a couple of million a year just to comply now with the kinds of efforts that will be needed to address the stormwater run off.

Our view generally is that we don't think we know enough yet about what will really work. That's one reason we want to move a little more carefully here.

Senator CHAFEE. My time is up and I'll get back to you with that same question, Ms. Prothro.

Senator Kempthorne?

Senator KEMPTHORNE. Mr. Chairman, thank you very much.

Mayor Fraser, if we could continue the conversation with you, you've indicated that the stormwater is not the highest priority in this clean water issue. Have you, in your own city, or has the National League of Cities come up with how they would prioritize the issues themselves within the Clean Water Act?

Mayor FRASER. I'd like to say that we have but the fact of the matter is that when I speak for the organization on this, I come to it not having the depth of expertise that some of the other members do or some of our staff do.

Part of what we're looking at is the continued addition of Federal mandates that are making us do things-and whether it's the ADA Act or dealing now with the problems of lead in water, or upgrading sanitary landfills or financing the cleanup of toxic waste sites, we're getting hit every time we turn around and that's one of our biggest problems. That's one of our concerns with the stormwater issue. It's partly a question that as we talk about cleaning up the environment we have a lot of things to look at, and we are looking at a lot of them. We're just not sure the stormwater issue rises to the top of priorities. There are just too many other problems we're looking at.

Let me add that my own city, Minneapolis, and St. Paul are one of a dozen cities around the world that have joined in a CO₂ reduction project. We are engaging in extensive planning on ways to reduce the emissions of carbon dioxide into the air.

So it is not that we are not environmentally conscious, we are enormously conscious of it but our dollar problem is getting worse every year. I see the administration saying, well, don't put so much money into this, but the problem is more of it comes out of our pockets.

The real difficulty is we're having to charge people without any reference to ability to pay. Our combined water, sewer and solid waste is running almost half of the average property tax bill now. These are direct charges, so that a person who is in poverty pays the same amount as somebody who is very wealthy. So the whole thing is not working well. We are very sensitive to these added costs.

Senator KEMPTHORNE. How would you characterize the extent of the problem of unfunded Federal mandates?

Mayor FRASER. A very large problem and growing every year. Nobody thinks local government spends money very efficiently and I've been wrestling with that problem for a decade and I keep looking at other levels of government and figure we are doing pretty well.

Senator CHAFEE. Don't look at us.

Mayor FRASER. Right.

[Laughter.]

Mayor FRASER. Our fiscal problems every year are getting tougher. Our police department wants to add more cops now because we're not doing very well for families and kids in this country, so I

don't know whether we should have more cops or be treating stormwater runoff.

Senator KEMPTHORNE. Can you make a case that there may be instances where you do not provide for the level of police protection because you are meeting a Federal mandate?

Mayor FRASER. Oh, yes. It's a balancing act and we have a wide range of local responsibilities, and we are unable to deficit finance.

Senator KEMPTHORNE. Don't ever start.

Let me ask other members of the panel, just to help me to determine, what should be the priority, if it's not stormwater? What should be the priority as we consider the Clean Water Act? Mr. Wagner?

Mr. WAGNER. I'd like to jump to the mike on this issue because AMSA has been a strong proponent for a while now of comprehensive watershed planning. I think that is the message we'd like to bring here. We're very pleased to see in S. 1114 the beginnings of a framework that would allow planning comprehensively.

The reality is that not every water body suffers from the same problems and those that have similar problems are not there to the same degree in every case. What the comprehensive watershed approach would do is to assess that and if in fact there is a watershed where stormwater is the greatest problem, then that should be attacked first. If there is a watershed where it's the least of the problems or is not a problem, then it need not be addressed or could wait on the back burner for an extended period of time.

Senator KEMPTHORNE. So you believe the key should be the comprehensive watershed planning?

Mr. WAGNER. Absolutely, yes. We'd like to work with the committee to even strengthen S. 1114 further in that regard.

Senator KEMPTHORNE. All right. I appreciate that.

Anyone else? Mr. Smith?

Mr. SMITH. Senator Kempthorne, I would agree in essence with what Mr. Wagner just mentioned. Comprehensive watershed management planning is a mechanism by which to help establish those priorities that can vary greatly from watershed to watershed and cannot on a national scale, let alone on a State scale, identify one problem as predominating or having higher priority. That is not the only mechanism by which that can be done.

States are currently involved in a regular evaluation and monitoring process wherein the Congress, under Section 305(b) of the Clean Water Act, instream monitoring is getting more and more recognition as a means to determine not only where there are problems but where the resources are nationally.

Senator KEMPTHORNE. My time has expired. Mr. Chairman, thank you very much.

Senator CHAFEE. Senator Durenberger, Senator Wofford has a time problem and if he could just give his statement and ask a couple of questions?

Senator WOFFORD. Mr. Chairman, I'm delighted we're holding this series of hearings and I'm very sorry that inescapable obligations cut in at both ends and I'm just here to pay my respects to this panel whose testimony I will read and my old friend, the excellent Mayor, Don Fraser, and to thank you also for inviting Paul Marchetti from Pennvest, our State Infrastructure Investment Au-

thority. It was started by Governor Casey while I was in his cabinet and I saw it grow and I saw it dramatically improve water quality throughout the State and draw on the Federal-State Revolving Loan Fund Program.

I commend to you Mr. Marchetti's specific suggestions for what we can do. I've read them, I agree with them, and I'm just very sorry that I can't be here for more of this very vital hearing. I've read a good part of the testimony and we're on the right track.

Thank you.

Senator CHAFEE. Thank you.

Senator Durenberger?

Senator DURENBERGER. Thank you, Mr. Chairman.

Don, I want to welcome you and everybody else. Most of the witnesses are people or organizations with which we are very familiar and very grateful.

Let me begin by endorsing Don Fraser's comments which does not need to be done these days. I think the President of the League of Cities is just the latest in a series of honors, if you will, although I don't know that he looks at it that way when he undertakes the tasks that have come Don Fraser's way over many years of public service.

Don, you probably don't know but I spent a good part of Saturday riding around in a police car in south Minneapolis and I must say, it's a revelation and an endorsement of what you've said about the difficulties of being a Mayor, but also says something about the difference in the way you can govern at the local level and how difficult it is to balance, and how dependent you are on the judgment of people that are a part of city government. You don't see that at other levels of government as you do when you have to run a city.

I know you take a lot of heat for things, those of you who are mayors, and other people at the city level, but I must say, when I look at the problems with which communities are faced in this country, I don't envy you your position at all.

You've also been a member of an organization called the CSO Partnership. Minneapolis has difficult and expensive combined sewer problems, along with other cities, that are members of that partnership. I wonder where the partnership is right now on CSO policy that EPA has put out? Does Minneapolis, the partnership, or the League still have problems?

Mayor FRASER. I think we feel very comfortable with the direction we're moving in with the CSO and the 15-year permit. In Minneapolis, we are about 95 percent separated. We have another \$34 million of expenditures ahead of us. We think that issue is moving well.

Senator DURENBERGER. I'd like to know what you think about sewer rates compared to the cost of other municipal services. How much, for example, does the average Minneapolis family pay for sewer services? Do you receive a lot of complaints when you have to raise rates?

Mayor FRASER. I don't have that broken out separately from water because we bill them together. We bill the sewer rates based on winter water consumption so in the summertime they are using water to water the lawns and so on, we don't end up charging them for sewer use.

I can just say those rates are going up steadily. The combined water, sewer, solid waste collections are running close to \$50 a month and that's about half the average property tax bill of a homeowner in the city. Our city's family income has not kept pace with the metropolitan income. We're experiencing a steady growth of poverty in our city.

The problem with these kinds of charges is that they take no account of how able or unable someone is to pay them. It's not a very good way to finance government but we are forced to do it because we don't have any other choices.

Senator DURENBERGER. Is there an awareness level on the part of the consumer?

Mayor FRASER. Yes. It seems almost every year we're raising water rates, sewer rates and solid waste rates. We had been billing quarterly and we think we have to go monthly now because the bills are getting so large. There's quite a high level of consciousness but people, in a way, are accepting because they don't see a choice but it's becoming increasingly difficult for them.

Senator DURENBERGER. One of the observations that always amazes and interests me about peoples' view of Minnesota is that they see all the lakes and beautiful cities like Minneapolis that's got lake after lake after lake and all the greenways connecting it and nobody gives any thought that there is also some cost associated with protecting that kind of resource. Can you give us some idea of the cost of doing that in a city like Minneapolis?

Mayor FRASER. I don't know that I can give you an overall cost. As you know, perhaps better than others, one of the difficulties we've been experiencing with the beautiful lakes in our city has been the runoff into the lakes. The algae has been flourishing with the fertilizers from the lawns being sent into those lakes, so our park board has been trying to deal with that now for some time.

The one cost figure I can share with you is that we're estimating that our stormwater requirements will add several million dollars a year at the front end and they will continue to climb as we attempt to address the broader issue of stormwater runoff.

Senator DURENBERGER. Maybe I'll ask both Don Fraser and Mr. Wagner about the issue of permit fees. This bill is going to require cities to pay fees to the States to fund State programs. Industrial dischargers will also have to pay the fees. I'm just wondering whether AMSA and the League of Cities support those particular provisions in the bill?

Mr. WAGNER. AMSA does support those provisions. We've said for a while now that one of the problems with the Clean Water Program is inadequate resources at the State level to manage the program and to do the technical and scientific work for setting water quality standards on a rational and scientific basis. So we think this is a modest price that dischargers should pay to help support those programs to get a more rational system under which they are regulated.

Mayor FRASER. We're a little bit concerned about the fees. We are charging customers the cost of our systems in the city and then turn around and pay additional fees. That is an issue on which I don't feel I can speak in any detail. What I'd like to do is have our

staff be in touch with the subcommittee staff and work on that question.

Senator DURENBERGER. Thank you.

Senator CHAFEE. Thank you.

I was very interested in your testimony, Mr. Smith, in which you said about the State Revolving Loan Fund that, through that you could get projects done quicker and in half the time than a project which received a Federal grant. Do you stand by that statement?

Mr. SMITH. Yes, sir, we do. The time savings essentially comes in due to the fact that States are able to work more closely with communities in developing projects and determining which requirements of the Revolving Loan Fund apply and which don't. Under the Grants Program, all that work only got us up to the point of awarding a grant; there was no construction that followed that until after bids had been let in the community and initiated.

Under the State Revolving Loan Fund, most States award loans at the time of award of those bids, so there is a very small lag time between the time the loan is awarded and the project actually breaks ground.

Senator CHAFEE. I was going to ask you the last question, Ms. Prothro about innovation. Your agency has some innovative thoughts on how to handle all these problems?

Ms. PROTHRO. I think especially in the Stormwater Program, I think that was the original context of your question, we really would like to promote innovation. We don't think end-of-the pipe controls are going to be the answer in the long term for stormwater, although in some cases, it may be necessary.

I certainly agree with what Mayor Fraser said. We don't know exactly what's going to solve the water quality problems in all cases, although we know we do have water quality problems from stormwater. We think in some cities, for example, it's as simple as eliminating illegal connections to the storm sewers, making sure that domestic sanitary waste is not going into the storm sewers. In other cases, maybe the possibility of using pollution prevention approaches and management programs of that sort may prevent the pollution from getting into the storm sewers in the first place.

So we really do want to promote a lot of innovation in this area. That's one of the reasons, as I said in my oral testimony, that we think some delay in the application of the water quality standards' numeric limits might be appropriate and reasonable here while we work on this and don't unnecessarily rush to solutions that in the long term may be expensive and not as effective as a prevention-based approach.

Senator CHAFEE. One of the things that our bill contemplates is that instead of these permits being required for the smaller cities, that there would be a plan they would follow, perhaps street sweepers going twice a year. I must say I'm for that but at the same time, I don't think I've seen a street sweeper in the past 10 years. Do they still exist or have they gone the way of the horse collar, or do you know? Mayor? I remember those great things that looked like a tank that came down the street with brushes, and maybe I'm just not around when they are there but I'd be willing to give anybody a dollar that could show me a street sweeper in

the City of Washington. I suppose that wouldn't apply to you in the City of Minneapolis, Mr. Mayor?

Mayor FRASER. We'd collect your dollar in Minneapolis.

Senator CHAFEE. You would?

Mayor FRASER. Yes.

Senator CHAFEE. Are they at night? When do they function?

Mayor FRASER. We have sweepings now twice a year, one in the fall after the leaves have fallen because if the leaves get carried into the system, then they clog things up, so we attempt to clean the streets after the leaves have come off the trees and then we have usually winters with lots of snow and debris, so in the spring-time we also sweep a second time.

Senator CHAFEE. I must say it must be very hard with the number of automobiles we have parked along the curbs, so how can the street sweeper do his job?

Mayor FRASER. They are posted. We post signs and we do pieces of the city each day.

Mr. ADLER. Senator, if I could jump in. I don't want to minimize street sweeping's importance but I agree with what Ms. Prothro said about prevention over end of pipe treatment. We would view end of pipe treatment as the least preferable stormwater solution. We should begin with site design type of practices that minimize runoff to begin with.

I'd cite the example of Davis, California which led the way in the 1970s and 1980s with innovative site design practices as a way of preventing stormwater control and found that stormwater control saves money for the city in the long run. Flood control, where you have to build expensive capture, collection and then treatment systems is very expensive. That's why we believe we need to get the newly developing areas into the innovative, prevention-oriented stormwater programs before the development has occurred. It will cost us more to collect the flood water and to treat it later than to prevent it to begin with.

Senator CHAFEE. Okay, Mr. Adler.

Thank you all very much for coming. We appreciate it.

We'll now move to the next panel of four witnesses and if they'd come forth promptly.

This panel consists of Ms. Terry Agriss from New York State; Mr. Kenneth Bruzelius; Mr. Paul Marchetti; and Mr. Ronald Marino.

Ms. Agriss, you go first. I will say I will have to be quite stern about limiting you to five minutes. We are running short of time here and I want everyone to have their chance.

Ms. Agriss, why don't you proceed?

STATEMENT OF TERRY AGRISS, PRESIDENT, NEW YORK ENVIRONMENTAL FACILITIES CORPORATION, REPRESENTING THE COUNCIL OF INFRASTRUCTURE FINANCING AUTHORITIES

Ms. AGRISS. Thank you very much, Senator.

I appreciate the opportunity to appear before you today. My name is Terry Agriss. I'm the President of the New York State Environmental Facilities Corporation. I also have the privilege this

year to be the President of the Council of Infrastructure Financing Authorities and I'm testifying on their behalf today.

We are very pleased that the State revolving funds have been established in all 50 States and also Puerto Rico. As of June of 1992, over \$6 billion in grants had been received by the States for the State revolving funds. Including State match and the leveraging that we've been able to do as of June of last year, \$10.7 billion in loans had been made from State revolving funds throughout the country. That was on behalf of 1,363 projects at that time and we've been very busy ever since; we are updating that survey even as we speak.

One of the interesting things about the State revolving funds is they have been able to finance not only the sewage treatment facilities themselves, but we have been able to be creative in many instances so that we have been able to finance combined sewer overflow projects, stormwater control projects, and also nonpoint sources of a variety of kinds.

One of the things that we would strongly urge the committee is that with the reauthorization of the Clean Water Act that you remain flexible and that you allow the States to continue to be as creative as they have been, on the financing side and we would hope, as well, on the project facilities side.

The SRFs, we believe, are working very well, but we also believe that there is a significant need for continued funding and we appreciate the levels that are included in S. 1114. As you know, EPA estimates that over \$100 billion worth of projects still need to be constructed and completed and, in fact, we believe the current amounts of money that will be available through the SRFs are of great concern. The Administration, we believe, had intended for the SRFs to continue at \$2 billion a year and we are concerned that the number might be significantly smaller as we look into 1994.

One of the reasons for our concern is that we believe that the SRFs do have the ability, after they are fully funded, to indeed meet the needs that have been identified, notwithstanding the size of the need. In our analysis, we have looked at the funds continuing to be capitalized at \$2 billion a year. If we did that for the next 12 years, we believe the funds would be fully capitalized. At that \$2 billion a year level for 12 years, we would be able to finance more than \$133 billion worth of projects over the next 20 years. That's a significant amount of money; it's obviously well more than grants would ever be able to finance at similar levels.

In fact, what we see now is that many States have gone to leveraging. We expect that 60 percent of the monies in the SRFs throughout the country will be leveraged in a very short period of time and that can allow us to fund enormous numbers of projects.

Senator CHAFEE. Could you repeat that? What were your assumptions to get to your sums?

Ms. AGRISS. Yes. If the funds were to be capitalized at \$2 billion a year for the next 12 years—

Senator CHAFEE. By capitalized, you mean if the funds were to continue at the rate of \$2 billion a year?

Ms. AGRISS. That's correct.

Senator CHAFEE. Keep going.

Ms. AGRISS. That over the course of the next 20 years, we would be able to finance \$133 billion worth of projects so that would be looking at \$2 billion a year for the next 12 years or \$24 billion. But because of the revolving nature of the funds and our ability to leverage those funds, we would in fact be able to do \$133 billion worth of projects.

Senator CHAFEE. What is the next step between your 20 years and your 12 years?

Ms. AGRISS. What we're saying is that after 12 years, you would no longer need to continue capitalizing the funds.

Senator CHAFEE. Capitalize meaning?

Ms. AGRISS. Appropriating monies for them.

Senator CHAFEE. Why did you mention 20 then?

Ms. AGRISS. We're indicating that even after you stop appropriating money for the funds, because the funds revolve in the SRFs, we would continue to be able to finance projects and with their revolving nature and with leveraging, we would be able to do \$133 billion in project financing.

Senator CHAFEE. So with \$24 billion of Federal funds?

Ms. AGRISS. That's correct.

Senator CHAFEE. Over 12 years, you could stretch it out or keep it active for 20 years and you'd leverage to a total of 160?

Ms. AGRISS. \$133 billion. That's based on the State matching for the revolving fund plus the local communities putting some money in through loan repayment.

Ms. AGRISS. That includes the 20 percent State match, it also includes some modest assumptions on how much interest earnings would go into the funds. We've assumed that the funds would earn, on average, 1 percent a year on their monies and also that for loans that are made with the direct capital in the funds, they would receive a 2 percent interest rate on them.

We can give you the details. I'd be happy to provide them to the committee.

Senator CHAFEE. You've got this in your testimony, extrapolating the subsidy and so forth. I think you explain it pretty well.

Ms. AGRISS. There's a chart on the last page, I think that helps in giving all these numbers.

Senator CHAFEE. Fine.

You can have a little more time because I took your time.

Ms. AGRISS. Very briefly and to summarize my testimony, we do believe the SRFs provide very significant benefits. They do provide low interest to municipalities. Some people have indicated this is not quite as good as grants. We've done analyses that indicate, particularly for communities where many elements of their projects are not grant eligible, the loan program can in fact not only compete, but in fact, in many instances, surpass the benefits that a grant program at 55 percent would provide.

Just a couple of other numbers, not to confuse anybody, but the State revolving funds frequently are saving somewhere on the order of 2.5 percent of the interest rate, so instead of a 6.5 percent rate, the loans would be made at say 4 percent. For a \$10 million project using this kind of analysis, the savings to the municipality on the \$10 million project would be \$3.1 million over the full 20 years of the loan.

If you extrapolated those numbers to the total loan pool that we've made so far—the \$10.7 billion that had been loaned out as of last year—the savings are anticipated to be somewhere on the order of \$3.3 billion to the communities that had received those loans.

Briefly, I would like to note we are very pleased that in your bill, S. 1114, there is a provision for hardship communities. We believe that most people look at those hardship communities primarily as small communities. We feel very strongly that small communities can be benefited if they have financial hardship through what we call a principal subsidy. Rather than providing a direct grant to those communities, we believe the SRFs can be used creatively so that only interest earnings on the SRF funds would be used to provide what might be called principal writedowns to those small communities.

It has the effect of reducing the amount of money that a small community would have to repay to the State revolving loan fund but it also would keep the actual amount of money originally in the fund intact so that you don't diminish the value of the fund over time.

Senator CHAFEE. You've used up the bonus time I gave you.

Ms. AGRIS. It could have about 30 more seconds, I'd just like to note that for larger communities, we believe loan stretchouts beyond the 20 years are the appropriate way of dealing with hardship.

Finally, I would strongly suggest that technical assistance is enormously important, particularly for small communities. We applaud the committee's efforts and suggestions of how to provide financial and technical assistance.

We would look forward to working with the committee on how that might be refined and perhaps improved in order to not diminish the size of the funds.

Very finally, I would urge the committee to stress the need for coordinating with other Federal agencies. The SRFs can work closely with RDA. I believe Ms. Prothro's testimony, to the effect that there is a lot of money in RDA, should be looked at carefully in conjunction with the SRFs.

Thank you very much.

Senator CHAFEE. Thank you very much. We appreciate it.

I notice that Mr. Marchetti is on your board and he works with you on the subject.

Mr. Bruzelius is here and perhaps Senator Durenberger wanted to greet him.

STATEMENT OF KENNETH BRUZELIUS, PRESIDENT, RURAL COMMUNITY ASSISTANCE PROGRAM, NEW PRAGUE, MINNESOTA

Mr. BRUZELIUS. Good morning, Mr. Chairman and Senator Durenberger. I am pleased to be here to testify this morning.

My name is Ken Bruzelius. I'm the Executive Director of the Midwest Assistance Program in New Prague, Minnesota.

Senator CHAFEE. Where is New Prague?

Mr. BRUZELIUS. That is just south of the Twin Cities about 45 miles and has a great bed and breakfast, the Schumacher Hotel.

[Laughter.]

Mr. BRUZELIUS. A little PR.

The RCAP network includes national, regional, State and local offices serving all 50 States and Puerto Rico. Over the last 20 years, RCAP has provided on-site wastewater technical assistance to small rural communities. The communities assisted by RCAP are primarily very small communities with populations under 3,500. They are disadvantaged communities, often communities with minority or underserved populations.

For example, Newburg, a community in Missouri, with a population of 598 was issued an abatement order by the Missouri Department of Natural Resources as a result of longstanding documented problems at its wastewater treatment facility. The enforcement action required that Newburg take immediate action to resolve these problems without consideration of the costs to the residents.

The Midwest Assistance Program was able to work with the community of Newburg to provide an innovative, technical solution to the problem. Unfortunately, it is very difficult for States to accept innovative solutions. There does not seem to be a well-founded process for validating such solutions so that they can be accepted by the regulators and by the engineers.

As you know, more than 29 million Americans lack access to basic waste water treatment and disposal services. A study conducted by the North Carolina Rural Community Assistance Program found that nearly 250,000 residents of that State still use a privy, drain their raw sewage into streams, or lack running water. The same is true in many other States and it is reported that more than 80 percent of all communities in violation of sewage treatment requirements are in small, often rural communities.

A recent study by the Center for Community Change indicated that States find small community compliance problems with the following problems: the failing on-site septic systems, poor operation and maintenance, inadequate level of treatment, and excessive infiltration and inflow. Those responses confirm EPA needs survey findings of similar problems.

Senator CHAFEE. Mr. Bruzelius, you've got a long ways to go and you've got short time.

Mr. BRUZELIUS. And I'm going to move.

In fact, we would like to suggest to you some recommendations in terms of the legislation. I would like to thank Senator Baucus and Senator Chafee and this subcommittee for their willingness to avoid the one size fits all approach.

As I mentioned, RCAP works with small communities. We would recommend that States be required to set aside at least 15 percent of the total SRF each year for projects serving small, disadvantaged communities. States should be permitted to use SRF matching funds to provide grants for planning and design assistance and other up front costs to small systems whether or not they are successful in getting a loan. No one project should receive a loan from the State's SRF in an amount greater than 25 percent of the State's total SRF in a given year.

States should be permitted to extend low interest loan payments for perhaps up to 40 years for projects in small, disadvantaged communities, or find other means to subsidize the costs. In addition to

the technical assistance by States that is included which we strongly support, we believe there should be national third-party technical assistance available specifically targeted to communities with populations under 3,500 and to disadvantaged communities.

RCAP favors the repeal of easement of the Davis-Bacon, especially as it relates to contracting and construction in small rural communities. We have found that does in fact add to the cost of projects.

We certainly thank you for the opportunity of testifying and would be happy to work with the subcommittee in regards to items within our testimony and within the bill.

Thank you.

Senator DURENBERGER. Mr. Chairman, can I ask just one question of Mr. Bruzelius?

Senator CHAFEE. Sure.

Senator DURENBERGER. You talked about the compliment to the two main authors of this bill on getting away from one size fits all and that was an appropriate comment.

One of the things the bill does do in that regard is it opens up the SRF program to septic systems. Instead of having central sewers and POTWs, a city can go to a septic tank on site to manage protection of health and water quality. As I understand it, the city would bill the homeowners for that particular service and out of that repay the SRF loan. Could you tell us your perspective on that kind of option?

Mr. BRUZELIUS. We certainly support and believe that kind of option can work. However, we also believe that there are many rural communities that cannot effectively build sewer systems, even under the septic tank and alternative treatment methodology with just a loan, that some subsidy needs to be provided in many rural, low income communities to enable them to solve their problems and in other communities, where there is high groundwater, where there are other circumstances, they really need to be moving from the septic system to a more managed community wastewater treatment system.

Senator DURENBERGER. Your point is the cost of putting in a septic system at a certain level or size of community or economic status of the community or something like that is still too high so that it can't be paid back through some kind of fee?

Mr. BRUZELIUS. An example is the community of Garrison, Minnesota with which you are very familiar, I'm sure, where it is a resort community and yet the residents there are rather low income, many elderly people, and they have individual septic systems, but there is high groundwater, there is concern about Lake Mille Lacs, there are many problems basically the State is saying you need to take that discharge into a different watershed in order to protect the lake. Those types of situations become very expensive for the community, so there needs to be alternatives.

Senator DURENBERGER. That part, I understand, but where a septic system would be an acceptable alternative, is it still too costly in some communities?

Mr. BRUZELIUS. It really depends on where you can take the effluent from those septic systems. Just to have on-site treatment in

many areas doesn't work and in some cases where it does work, yes, I'd say a loan may help.

Senator DURENBERGER. Thank you, Mr. Chairman.

Senator CHAFEE. Mr. Marchetti who is Executive Director of the Pennsylvania Infrastructure Investment Authority in Harrisburg, Pennsylvania.

Mr. Marchetti?

STATEMENT OF PAUL MARCHETTI, EXECUTIVE DIRECTOR, PENNSYLVANIA INFRASTRUCTURE INVESTMENT AUTHORITY, HARRISBURG, PENNSYLVANIA

Mr. MARCHETTI. Thank you, Mr. Chairman.

Good morning. As you pointed out, my name is Paul Marchetti. I'm Executive Director of the Pennsylvania Infrastructure Investment Authority, otherwise known as PENNVEST.

What I'd like to do this morning is to briefly describe the PENNVEST program and also offer some comments on Senate Bill 1114 that I think the subcommittee might want to consider as this bill moves forward.

As Senator Wofford pointed out, PENNVEST was created in 1988 by Governor Casey in order to address a large number of drinking and waste water problems that existed at that time across the State of Pennsylvania. About a third of our sewer systems were under limitation bans, connection bans, and we led the Nation in the outbreak of waterborne diseases at that time.

Since PENNVEST was created with approximately \$1 billion in funding, three-quarters of which came from the State, and the balance of which came from the SRF Program, we have been able to fund approximately 650 drinking water and waste water projects across the Commonwealth with a total funding of slightly over \$1 billion.

In 1992, a referendum passed overwhelmingly in Pennsylvania that gave us an additional \$350 million in funding capacity and also gave us the ability to fund stormwater projects.

Most of our assistance is in the form of low interest loans. We average about 2.2 percent in our interest rates. We have about 5 percent of our assistance in the form of grants which we fund through State appropriations. The majority of our funding goes to larger systems, although approximately 30 percent goes to smaller systems which are defined as those with 1,000 connections or less. I should point out also that they constitute over half of the recipients of our loan and grant awards. Small systems also receive about 75 percent of our grant assistance.

Probably the primary characteristic of PENNVEST which is an attribute reflected in S. 1114 and that I commend the subcommittee for putting into this legislation is flexibility. We have a lot of flexibility in the State program, some of which is lacking in the SRF Program. I'm pleased to see that some of that flexibility is now being written into this legislation.

In terms of my comments on S. 1114, I'd like to express my pleasure to see that the loan-based approach that I think has been successful in Pennsylvania as well as other States in the SRF Program

has been maintained. I think that has been a very successful endeavor and I am glad to see that it continues.

Among the provisions I would like to comment on briefly in terms of funding, the needs and the SRF funding needs in Pennsylvania are over \$3 billion. If we got the funding that is proposed in this bill along with what we have received already, we would get approximately \$1 billion between 1989 and 2000. As I'm sure you hear from many States, we would like to see that funding increased if at all possible.

Second, as far as the principal writedown provision goes, as it is incorporated in this bill, I am in favor of that. I think it addresses the needs of many small and economically disadvantaged communities that have a very difficult time in meeting the user rates that are otherwise required to pay for these projects. I think the flexibility that the States would have to use a portion of the SRF as a principal writedown in order to provide some grant assistance to these communities would be very helpful.

Third, I support the inclusion of land costs as an eligible item. We now do that with our State program and I think it's entirely appropriate that be eligible under the SRF. As far as the leveraging provision proposed in this legislation, I would urge the committee to not require that. I think leveraging is a good idea, it certainly is true for Pennsylvania, but it's not necessarily true of every State. Leveraging, although it's advantageous, it does not increase the total capacity of the fund but rather moves some of that funding sooner into the present rather than having it available later. I think States should have the ability to decide when they want to time their SRF funding.

Finally, I would like to encourage the inclusion of an additional provision and that would be allowing extended term loans in cases where user rates are still very high. I think the 20-year restriction should be relaxed to perhaps 30 years or at least something coincidental with the design life of the facility being funded.

That concludes my comments. I'll be glad to take any questions.

Senator CHAFEE. Thank you, very much. That was good testimony.

I was interested in one comment you made in which you said, "Pennsylvania has the largest rural population in the country." I'm stunned at that.

Mr. MARCHETTI. So was I. I was surprised to hear that.

Senator CHAFEE. I'll give you another stunner. I was Governor when Bill Scranton was Governor of Pennsylvania and I remember him saying once that there are more deer killed on the roads in Pennsylvania than in any other State or maybe there are more deer in Pennsylvania than any other State in the Nation. Does that ring a bell?

Mr. MARCHETTI. That could very well be true.

Senator CHAFEE. It's a big State with a lot of rural and wooded areas.

Mr. Bruzelius, I've been pondering over your statement that 250,000 residents of the State of North Carolina lack indoor plumbing. I checked on the population of North Carolina. What do you think it is?

Mr. BRUZELIUS. I do not know, sir.

Senator CHAFEE. It's 6,037,000, so 250,000 residents without plumbing is 4 percent of the population. Do you think you're accurate?

Mr. BRUZELIUS. I believe so. The 1990 Census deals with sub-standard housing and one of the primary characteristics in the sub-standard data is lack of central water or sewer services.

Senator CHAFEE. And also your 50,000 households in Virginia seems high but that leads us into Mr. Marino.

[Laughter.]

STATEMENT OF RONALD MARINO, VICE PRESIDENT, PUBLIC FINANCE DIVISION, SMITH BARNEY, HARRIS, UPHAM & CO., INC., REPRESENTING THE PUBLIC SECURITIES ASSOCIATION

Mr. MARINO. Thank you, Mr. Chairman.

My name is Ron Marino and I'm a Vice President in the Public Finance Division of Smith Barney. I'm here today to testify on behalf of the Public Securities Association. While I'm doing that, I'll also try to distinguish my position from theirs.

I think basically what I am here to try to do today is look at some of the fundamental public policy and public finance issues. I'm certainly not an environmental systems analyst or an engineer, so I really don't know the technology but I can talk a little bit since I worked in New York City government for 8 years and public finance for the last 6 about some of the principles embodied in the legislation.

I think fundamentally, Senator, there is an intense competition growing throughout the United States over Federal aid. It's certainly not an insight, we know that. We know there is less Federal aid, more pressures on the State and in turn, more pressure on the counties, and in turn, more pressure on the cities to balance the various equities and interests that Mayor Fraser mentioned earlier.

Usually when you try to balance those interests and equities, infrastructure loses out. It certainly isn't chic, it's not sexy, and unless an intense storm hits Florida, then we quickly see our dependency on a strong infrastructure system or the bulkheads break in the City of Chicago and half of Chicago gets flooded, or a bridge collapses over the Mohawk River on the New York State Thruway, then we suddenly understand the importance of the infrastructure system.

Most basic I think is the Federal role in this. You've selected a very creative Federal role through the revolving loan fund. Revolving loan funds I think allow a State, and in turn the counties and localities, more flexibility in the grant programs. It's a self-insulated source of capital that will actually grow over time as the loan is repaid. It's a more efficient system. As Mr. Smith said, the loan program actually gets the construction started faster than the grant program. It's a vehicle to make feasible projects more feasible and unfeasible projects, because they can't meet the market requirements for capital, makes those projects feasible. It invests less public dollars as you go through the system of making more capital available.

Last, it gives more self-sufficiency and a more efficient decision-making process as we go through the system of allocating the priorities within a State, in a county and last to the city.

In 1987, we were told that there were \$83 billion of need just in this one area of wastewater and also competing needs in other infrastructure areas.

As Terry said in her testimony and Paul in his, while we can't meet that \$83 billion, what we do need is the basic legislative design to allow flexibility on the local level, to allow these two States, New York and Pennsylvania with very distinct programs, to aggressively leverage those dollars.

Some of the provisions in this bill tend to help that process as we move forward over the next 5 or 6 years. Allowing a loan term to be extended to the period of probable usefulness of the facility I think is quite important. Allowing land acquisition is also important.

I also understand in talking to some of the staff and in discussing with Senator Graham, that the Committee is also interested in trying to increase the velocity of the loan. How can we get this loan processed quicker and get the loan repayments back into this local bank that each State will create? Again, I think flexibility will be the key word here. You will need to look at various State models and allow, as the present legislation does, for this money to be used only for construction projects or in conjunction with construction or with the long-term takeout.

What you need to do is to look at the credit quality and the ability to pay of the counties and the localities. To mandate certain requirements would make it very difficult and indeed make the program unusable for counties of a low income nature or for counties that have a low credit quality. We need to assist those counties through some credit mechanisms. Indeed, it might sound counter intuitive that allowing for a principal writedown, actually lowers the cost for the entire financing because the rating agencies look at the weakest link. If you can help the weakest link, you will upgrade the overall number of projects and lower the cost of those projects being financed.

Senator CHAFEE. I'm not sure how you differ. You said you differed from Ms. Agriss.

Mr. MARINO. No, I wasn't differing. I said I was supporting what she was saying on that particular point.

Senator CHAFEE. Okay. Go ahead.

Mr. MARINO. A model you might look at in terms of the Federal mandates is the Intermodal Surface Transportation Efficiency Act where this committee also has jurisdiction over that legislation. In that model, in the revolving loan fund, when the loan is recycled and repaid, mandates are eliminated for Davis-Bacon for MBE, WBE, certain Federal construction requirements. That may be a way of incenting localities and States to use this money and then to be free from certain requirements. You want to eliminate all the vestiges of Title II.

Last, Mr. Chairman, let me say this because of your interest, I live in the City of New York in the Borough of Brooklyn about a mile-and-a-half south of the Brooklyn Bridge. The city actually has mechanical sweeping four times a week, two times on the north

side, two times on the south side, Monday, Thursday, Tuesday, Friday, and we use mechanical, GM and Mercedes-Benz.

Being a former city official, I'm sure we can arrange for a tour. If you're ever in the area, we'll get you down there.

The other thing is we actually had a program with 125 manual sweepers that would do the intense commercial areas of Manhattan and the boroughs but that's been eliminated due to the fiscal situation of the city.

Senator CHAFEE. Manual, you mean just pushing?

Mr. MARINO. Right, the guys with the brooms and the cans. Those guys were out there doing it.

Thank you, Senator, for the opportunity.

Senator CHAFEE. Thank you, very much.

Mr. Marino, as I understand your testimony, you are supportive but the only problem you had was some of the mandates that go along with the Federal program, correct?

Mr. MARINO. I think that's one area, Senator, that you want to provide flexibility and discretion. I think most States now have quite strict requirements for environmental, for MBWE & WBE, for local wage rates. You might want to utilize those State requirements rather than mandating Federal requirements. I think often we lose sight of the balance between the three levels of government. While it's important for the Federal interest, because you have money in this program and you do have an interest in it, I think at some point that interest terminates and you should allow the State, the county or the localities' rules and regulations and standards to be utilized.

Senator CHAFEE. What do you say about that, Mr. Marchetti?

Mr. MARCHETTI. I think I would have to support what Mr. Marino is saying. In Pennsylvania, we have a very extensive design process for sewer systems and review process. I think the States generally do a good job of ensuring that this program functions in a very efficient way. I think the States ought to maintain that flexibility to do that on their own.

Senator CHAFEE. What do you say, Mr. Bruzelius?

Mr. BRUZELIUS. I certainly agree that those requirements increase the cost of local projects and ways to take the Federal mandates off and make it more of a State or locality issue would help to fund more projects and get more bang for the bucks.

Senator CHAFEE. All right.

Senator Graham may have some questions; if so, he will submit them to you and you can respond for the record.

Senator Lautenberg has a statement he'd like included in the record.

[Senator Lautenberg's statement follows:]

STATEMENT OF HON. FRANK R. LAUTENBERG, U.S. SENATOR FROM THE
STATE OF NEW JERSEY

I welcome today's hearing to review issues that are critical to my State and its environment: sewage treatment funding and municipal pollution control.

We simply cannot achieve the goals of the Clean Water Act without adequate sewage treatment facilities. While we have provided over \$60 billion in Federal funds for these facilities, the remaining needs are monumental.

The state revolving loan program, which this Committee initiated in the last Clean Water Reauthorization, is making efficient use of limited Federal and state

funds for sewage treatment improvements. I support continuation of the funding for this program. And I am pleased that S. 1114 would increase the authorization for the state revolving loan program.

But with the large remaining needs, it's going to take more than Federal funding to get the job done. A few years ago, Senator Bradley and I introduced legislation to remove barriers to the privatization of sewage facilities. Last year, EPA announced that it would be developing an initiative to increase privatization.

I hope that our witnesses today can give us their views on the role privatization can play in meeting our sewage treatment needs.

One need which must be addressed is correction of combined sewer overflows. CSOs discharge raw sewage, industrial waste, and floatables, polluting our water, closing fishing grounds, and discharging garbage which winds up on our beaches. I'm pleased that the environmental community and the metropolitan sewage agencies have been able to negotiate a regulatory program for CSOs so we can get on with the job of reducing the impacts that CSOs have.

I hope we'll see this same spirit of cooperation as we address the contentious problem of storm water control.

Senator CHAFEE. Again, thank you all very, very much for coming. We appreciate it and it has been very helpful.

[Whereupon, at 12:15 p.m., the subcommittee was adjourned, to reconvene at the call of the Chair.]

[Statements submitted for the record follow:]

STATEMENT OF HON. DONALD M. FRASER, MAYOR, CITY OF MINNEAPOLIS, MINNESOTA AND PRESIDENT NATIONAL LEAGUE OF CITIES

Mr. Chairman, members of the Subcommittee: I am Don Fraser, Mayor of Minneapolis and President of the National League of Cities. I am here today to testify on behalf of NLC and the 16,000 cities and towns across the nation we represent on S. 1114, the Water Pollution Prevention and Control Act of 1993.

For years, the nation's cities and towns have been your allies in securing enactment of national standards to protect our environment. The National League of Cities worked with you and supported reauthorization of the Clean Air Act Amendments of 1990; we rejected recent attempts to weaken the Safe Drinking Water Act; we worked with you in establishing the State Revolving Loan Fund and on Superfund.

For too long now the ability and capacity of local governments to absorb and implement unfunded mandates has been dismissed and ignored by both the federal and state governments. There are many municipalities that want you to rescind the overload of federal dictates. What that tells you in part is that municipal officials feels sufficiently impacted by the federal deficit that we are no longer sure that it is in our best interest to ask you to pay for what you mandate; the preference is that you just stop mandating.

But, what you must also understand, is that these same municipalities have reached the point where they are confronted with Hobson's choices: having to choose whether to provide safe drinking water to their citizens or public access to all handicapped individuals; whether to upgrade their sanitary landfills to meet new federal requirements or implement a federal mandate to control pollution from stormwater run-off; whether to provide lead-free public housing or finance clean-up of toxic waste sites—all of which, however worthy, are unfunded requirements imposed on municipalities by the federal government. The resources to pay for it all are simply not there.

Our financial constraints are different from yours not only in magnitude, but in the very limited access local governments have to sources of revenue. We are constrained by state law in what we can tax, when we can tax, and how much we can tax. Most municipalities have access only to limited portions of the most regressive taxes; few municipalities share in revenues generated by income taxes and even fewer are permitted to impose such a tax. And, unlike the federal government, we are prohibited from deficit spending.

We are pleased to note that our untenable circumstances have at last been recognized and that this committee's leadership—Senators Baucus and Chafee—has taken the critical first step toward restoring the governmental partnership that is essential if we are to accomplish effectively our mutual national environmental objectives.

The priority Clean Water Act issues for the nation's cities and towns are substantially addressed in your proposal:

- Clarification of Congressional intent and revisions of the *stormwater* management program;
- Revision of the requirements for addressing pollution from *Combined Sewer Overflows*; and
- A continuing *federal financial commitment* to assist in implementation of Clean Water Act requirements.

The other issue in which we have a vital interest is how you resolve the current conundrum on *wetlands* and we look forward to reviewing that proposal when it is completed.

STORMWATER

The stormwater program has been a major issue for the National League of Cities for over ten years. We have been to the Congress three times on this issue over the past several years and in succession, the Senate, this Committee and the House Public Works Committee have taken the initiative to delay implementation of the program for the nation's smaller cities and towns. It has been, and continues to be, unacceptable to local officials for the federal government to hold municipalities responsible to accomplish what no one knows how to do at a price that is absolutely unaffordable. The bill pending before you at long last begins to address the real issues facing municipalities in implementing a stormwater program.

What we believe has been poorly understood is that no one—not EPA, not the Congress, not the environmental community—has ever made a credible case to municipal officials that urban stormwater run-off is:

- first of all a priority problem of a magnitude deserving the investment of millions—if not billions—of scarce local dollars;
- second, an issue we can address effectively regardless of the resources invested; and
- third, the major contributor of what, in effect, is a non-point problem, to ongoing pollution in our rivers and streams.

For NLC, the bottom line on a stormwater amendment is no end-of-pipe requirements and S. 1114, at least for the foreseeable future, provides municipalities with that absolutely essential relief. The provision in your bill that imposes a ten year moratorium on numerical effluent limits and water quality standards, cannot be amended or deleted. *It is not negotiable.* You have taken an important step in the right direction, a step which will keep much of the municipal community as your allies in passing this measure.

It is also important for you to understand that while the provisions in S. 1114 are a vast improvement over where we are now, the new proposal is not without significant cost. Recent estimates by the American Public Works Association for the cost of level 1 BMPs, that is, the least costly strategies to control pollutants in urban run-off, is over \$1.1 billion a year. That represents an average cost of half a million dollars a year for the cities that will be required to implement a stormwater management program. And, the CZMA Guidance goes far beyond level one BMPs.

We would like to recommend several revisions to your stormwater proposal. First, we would like you to include a legislated role for local officials in the re-write of the CZMA Guidance and the development of any additional Best Management Practices as they apply to municipal stormwater programs. Local officials are, after all, on the "cutting edge" and the only repository of knowledge on this issue. The nation's larger cities are, and have been, struggling with this program. We have already invested significant local resources in stormwater management. Use this knowledge, build on it, learn from it. Don't allow the expenditure of scarce resources reinventing wheels we have already thrown away because they don't work. Such an addition to your bill would absolutely clarify that we are again partners, working together to solve mutual national problems!

Second, we would propose you dedicate some federal resources to finding the techniques that will accomplish the objectives of a stormwater management program. We must begin to develop the knowledge about what works and what doesn't work in controlling pollutants from stormwater, or we will be no further along ten years from now in knowing the appropriate approaches to stormwater run-off. While we have no specific policy on the matter, and are usually opposed to set-asides from the SRF, you might want to consider an amount off the top for grants to municipalities to test and assess new and innovative stormwater management strategies and programs.

We do not have the resources at the local level to invest in demonstrations that may or may not work. And right now, we have no idea whether BMPs or any other strategies will have any significant impact on the receiving streams. Certainly, we

have no information on whether numerical effluent limits are achievable, or what, if anything, will get us to water quality standards. It is unfair to ask the citizens of a given municipality to finance the research for what some perceive is a national problem or to risk local resources on a program that may provide no benefit. We cannot justify expenditures for experimentation to our local citizenry. That is a national responsibility. If you are serious about numerical effluent limits and water quality standards for stormwater run-off than there must be a program to finance the research, the trial and error, that will get us there, if such a feat is even possible.

We must take advantage of this ten year period to investigate how and whether these requirements can be met. We would think it is self-evident that a body of knowledge indicating whether a requirement is even feasible is essential before moving forward to implement such a requirement.

Our third recommendation is to ask you to include "municipal industrial facilities," within the system- or jurisdiction-wide permit. Under current EPA regulations municipally owned and operated "industrial" facilities such as sewage treatment plants, municipal garages, airports must file separate permit applications. We believe that if we are to be held responsible for pollutants in our stormwater run-off, we will certainly have to address all sources of pollutants over which we have direct control. By including municipal facilities in a city-wide permit, the same objective will be accomplished without the added expense of applying for additional permits.

STATE REVOLVING FUND

NLC recently re-examined and developed new policy on the concerns of local government in the financing of our national goals in attaining and maintaining the national commitment to clean water. The Baucus-Chafee measure is again a significant step in the right direction: a renewed federal investment in meeting Clean Water Act needs; provision for grants to distressed communities; and an expanded number of pollution control activities eligible for financial assistance.

We are most pleased to see your recognition that for some municipalities—those whose citizens are facing unrealistic cost increases in water and sewer bills—compliance with federal Clean Water Act requirements will be possible only if non-repayable sources of revenue are available. Allowing the states to use their matching share for grants should—particularly in states that are experiencing severe financial constraints—facilitate broader opportunities for local compliance. We are disappointed, however, that no portion of federal funds are made available for grant funding to municipalities.

We also support your grant provision's broad reach and the recognition that it is not only small communities that need grant assistance.

As currently drafted, my city would not qualify as a distressed community, but let me assure you we are only half a percentage point away. Water and sewer bills in Minneapolis are more than 50% of the average property tax liability.

NLC's policy also endorses expanding the activities eligible for federal financial assistance under the Clean Water Act. We also commend you for including septic systems as eligible activities for financial assistance.

I would, however, also reiterate our concern that some grant funds be made available for demonstration stormwater programs. Your bill proposes to deposit SRF funds that remain unobligated after two years to the federal treasury. While we recognize such funding might ultimately prove to be unavailable or hopelessly inadequate, you might consider redirecting unobligated balances to a stormwater demonstration program rather than the proposed reversion to the federal treasury.

COMBINED SEWER OVERFLOWS

NLC strongly supports the committee's ratification of EPA's proposed CSO guidance and your provision of authority to issue "long-term," that is, 15 year, permits. As you may know, NLC was part of the negotiation that developed the proposed guidance and although consensus was never achieved, we are generally satisfied with the guidance.

Mr. Chairman, Senator Chafee, you are to be commended for your efforts. While undoubtedly there will be some of my colleagues who will believe you have not gone far enough, we are thankful for your efforts to restore rationality to a process that was getting out of hand and for your recognition that we are partners in helping to attain our mutual environmental objectives.

I would like to request that NLC's Policy on the Clean Water Act be include for the record and to thank you for the opportunity to testify.

National League of Cities
Energy, Environment and Natural Resources
1993 National Municipal Policy

2.05 Water Quality And Supply

A. Problem

It is becoming increasingly apparent that no section of the country is immune to the problems associated with both natural and man-made water pollutants. Urban stormwater and construction runoff have long been recognized as major contributors to water quality problem, and in many older cities, the existing sewer system with deteriorating pipes may be one of the main causes of water pollution. The growing concern over the introduction of toxic chemicals and pesticides into the environment and their impact on the ground water have added a new dimension to existing problem.

New treatment plants are generating mountains of sludge to be disposed of, and serious questions about land application practices encouraged by federal legislation are being raised as the concern over heavy metals, organic chemicals, and pathogenic organism grows.

There is increasing evidence of organic contaminants, viruses, and other disease-causing organism in our nation's public water supplies.

Expanding industrial activity has resulted in the discharge of a wide variety of synthetic organic chemicals into the rivers from which a large number of cities draw their drinking water. In spite of increasingly stringent controls on water pollution, small amounts of these chemicals have still been widely detected in the treated drinking water of many cities. Several of these synthetic organic chemicals are known as possible carcinogens, although the exact extent of the public health hazard posed by quantities of those chemicals present in cities' drinking water is not fully known.

The limited availability of water in all parts of the country also appears to be a growing and difficult problem.

Individual cities and in some cases entire regional water basins are feeling the constraints of limited water supplies. In some places, constraints have become true shortages. New reservoirs or diversion projects can no longer be solely relied upon to solve the problem. The number of possible sites, the environmental disturbances, the financial costs, and the absolute supply of water severely limit these structural solutions. Nor can greater amounts of groundwater be relied upon. In some locales, ground water mining has led to exhaustion of supplies, diminished stream flow, and land subsidence, and salt water intrusion.

Water has not traditionally been subject to price-determined allocation. Instead, it has been distributed according to a complex mix of state laws, federal regulations and charges, and local rates. It is a haphazard system at best, one which nearly defies rational evaluation. For many projects federal funding and water rates are such that taxpayers subsidize projects, the benefits of which go disproportionately to a limited number of agricultural and industrial uses.

B. Goals

The basic principle for dealing with water pollution must be that no one has the right to pollute—that pollution continues because of technological limits, not because of any inherent right to use the nation's waterways for the purpose of disposing of wastes. However, the impracticability of immediately eliminating all pollution also must be recognized. A reasonable relationship of economic and social costs and benefits should be a necessary precondition toward achieving a nonpollution goal. The ability of municipalities to comply with any clean water program must be recognized as contingent upon adequate funds for building treatment facilities. In addition, any clean water goal must be applied on a uniform, national basis to prevent movement of industry in search of loosely enforced standards.

The nation's drinking water should be as safe as is technologically feasible at reasonable cost. Most Americans receive their drinking water from public water system owned and operated by local governments. It is thus imperative for the continued health and welfare of the nation that local governments have the financial resources and technical expertise needed to provide adequate and safe drinking water to their citizens.

C. Clean Water Act Policies

1. Federal Funding

Federal participation in the financing of projects mandated by the Clean Water Act is critical to the ultimate achievement of national water quality goals. The federal government must continue and expand its partnership with states and localities in the funding of Clean Water Act mandates. Federal contributions to the financing of water pollution control needs must be both substantial and a reliable long-term source of capital.

a. State Revolving Loan Fund

NTC continues to support the state revolving loan program (SRF) as a supplement to, not a substitute for, a grants program. The federal government should authorize an annual appropriation of funds which would be distributed to the states according to a specified formula. The states should then establish their own revolving loan programs for the distribution of loans, loan subsidies, or bond subsidies to localities for meeting Clean Water Act mandates. Such a supplementary program would help leverage federal funds, reduce annual local debt payments, and provide localities with added flexibility in structuring their Clean Water Act financing plans. Congress should prohibit states from using the interest on SRF loans to local governments to meet state matching requirements.

b. Grants

It is estimated that the nation's cities and towns face over \$200 billion in unfunded Clean Water Act mandates to comply with secondary treatment requirements and separation of combined sewer overflows. These cost estimates do not include implementation of separate stormwater management or wetlands protection or mitigation program.

NTC calls on Congress to restore grant funding to mist municipalities in progressing toward meeting the nation's clean water goals and objectives. Without such assistance it is unlikely that municipalities will be able to comply with federal clean water mandates.

c. Use of Funds

Federal funding for Clean Water Act purposes should be available to meet all Clean Water Act mandates imposed on municipalities including construction of wastewater treatment plants, interceptors and major appurtenances, infiltration/inflow correction, major sewer rehabilitations, repair, upgrading, collector sewers, combined sewer overflows, separate stormwater management program and wetlands mitigation projects.

Cities should be eligible for grant or loan funds or any combination of loans and grants to meet their water pollution control needs. Under no circumstances should any community be permitted to use grant funds for repayment of loans granted under the Clean Water Act.

The use of loans and/or grants should be tailored to the specific needs and capacity of each municipal applicant for federal financial assistance. Allocations of funds to municipalities should take into consideration a community's ability to pay and past local efforts to address the problem.

d. Sources of Funding

The federal government should redirect non-domestic spending priorities to assure adequate resources to meet Clean Water Act mandates. Congress should allocate a portion of these redirected resources to a fund dedicated to implementation of water quality requirements.

Under no circumstances should the federal government look to traditional local sources of revenues (e.g., a federal tax on water and sewer user charges, a federal tax on industrial dischargers to POTWs) to fund increased federal participation in financing Clean Water Act mandates.

e. Tax Code

Congress should remove current restrictions on the availability of federal tax incentives for private financing of wastewater treatment facility needs, since such financing arrangements may reduce capital costs and expedite project construction, upgrading, repair, rehabilitation, etc.

2. Compliance

To enable municipal compliance with federal secondary treatment requirements, Congress should restore adequate grant funding and assure full funding of the SRF. Additionally, state governments should provide increased assistance for construction of wastewater treatment facilities and localities should collect sufficient revenues through assessment of user fees to help pay for the needed construction.

3. Local Financing

Local governments should have the choice between the ad valorem property tax, metered user charges, and any other mechanism for recouping construction and operating costs. Federally mandated sewer user charges should be deductible from federal income tax.

4. Level of Treatment

The statutory requirement of "secondary treatment" should be defined as a desired level of water quality and not restricted to any one particular process. This desired treatment level required of municipalities should be defined to prevent expenditures for unnecessary and expensive facilities. Moreover, the least expensive solution should be favored, such as low flow augmentation, when such a solution is the most economically efficient solution.

5. Needs Survey

Cities should cooperate with their states and the EPA to develop a accurate and equitable needs estimate for the annual survey required by the Act. EPA must assure that project priority lists submitted by states give highest priority to projects in areas of greatest need, and assure the highest return in the amount of pollution controlled for each dollar of federal assistance expended. Attention should also be given to problem of small, rural communities.

6. Areawide Planning

Where wastewater treatment planning is on a areawide basis, local elected officials must have primary responsibility. Management agencies should be designated in response to the desires of local elected officials, and should assure a fair voice for each participating government on a one-man, one-vote, or weighted vote basis. Preference should be given to existing planning and management agencies where they have demonstrated expertise and capability. Each city should be designated a management agency, if so desired. River basins should continue to be basic units for the development and administration of water resources. River basins should be developed to assure the maximum benefits possible in both water supply and recreation to the communities they serve.

Areawide water quality management programs required under Section 208 must be assured adequate federal funding for implementation and continued planning and management. Funds must be made available for adequate technical assistance to aid in the transition from planning to actual implementation of plans.

7. Discharge Analysis

Any extensions of the deadline for compliance with secondary treatment standards should allow adequate time for individual analysis of current discharge practices. The analysis should focus on all relevant environmental effects including air quality, land use and energy efficiency. When evidence indicates that the technique utilized does not significantly degrade the environment, the facility should be exempted from additional treatment. The practice should continue to be monitored and if a unfavorable change is noted, additional treatment should be required.

8. Desalinization and Recycling

Government policies should encourage expanded use of desalinization processes and recycling of wastewater along with recovery of sludge and other resources material.

9. Beneficial Use of Sludge

Federal regulations on the management of municipal sewage sludge should encourage its beneficial reuse. Reasonably anticipated adverse effects associated with potential sewage sludge exposure and local geographical and climatic conditions must be considered in the safe disposal of sludge. If site specific consideration can be shown by reasonable risk assessment analysis to be environmentally sound, then the management practice should be permitted.

10. Sedimentation and Silting

Sedimentation and silting of lakes, creeks, estuaries, or other streams must be checked and avoided in all future planning. Whenever such silting and erosion has already occurred, research should be continued to find ways of correcting this condition, within an ecologically sound framework.

11. Research

EPA should support research on problems growing out of the management of wastewater treatment facilities such as combined sewer overflows, land application of treatment effluent and sludges, and source reduction.

Innovative and alternative technologies have not been used to their fullest potential. Therefore, federal research, development, and public education of these technologies should expand, but not at the expense of research on management and operational issues.

Source reduction technologies and programs are prohibitively expensive for individual municipalities to develop. For example, to enable municipalities to reduce levels of metals and other toxic pollutants from non-industrial sources, EPA should undertake research to identify products introduced by small business and residential generators and suggest control programs for reducing these pollutants.

12. Pretreatment

EPA should establish national categorical pretreatment standards only for those industries that it has classified as major polluters and only for those classes of toxic pollutants which are known to be widespread and which may be causing human health and aquatic life problems. EPA should be required to publish, by date specific, a listing of categories for which action will be required.

Local governments should be allowed to devise methods to satisfy national standards that not only assure protection of water quality but which are also cost effective under the conditions of their particular jurisdiction. Therefore, as an alternative to federally mandated implementation of the national categorical pretreatment standards, Congress should authorize states to approve local pollutant elimination programs.

To qualify for the alternative local program, a Publicly Owned Treatment Works (POTW) should be required to demonstrate to an authorized state agency that: 1) the POTW is in compliance with the requirements of its permit under the National Pollutant Discharge Elimination System (NPDES); 2) it has developed and implemented a local pollutant elimination program that in the aggregate is equivalent to implementation of the national categorical pretreatment standards; and 3) it is maintaining a local monitoring and reporting program which is adequate to disclose the quality of the receiving waters.

13. State Water Quality Standards

The current Clean Water Act requires states to designate how each water body is to be used within its jurisdiction and to develop standards for attaining that use. Under no circumstances should a state be allowed to downgrade or revise its water quality standards where the designated uses have already been attained. However, a state may revise its water quality standard if it can demonstrate that: 1) the existing designated use is unattainable because of irretrievable man-induced conditions; or 2) attainment of the designated use would result in substantial and widespread adverse economic and social impact.

Where the water quality of a stream exceeds the level necessary to maintain a designated use, a state should have the option to allow lower water quality for that stream because of necessary and justifiable economic or social development for which there is no feasible alternative. In no case should the degradation of water quality interim with or become injurious to existing instream use. Before a state exercises such an option, it should be required to hold public hearings and coordinate with all affected governmental agencies.

14. Toxicity Testing

NLC supports the use of Whole Effluent Toxicity Testing (WETT) for the assessment of the potential toxicity of wastewater discharges; however, legislation should be adopted to prohibit the use of such tests as "pass/fail" NPDES permit conditions imposing strict liability on POTWs.

15. Common Law

No municipality injured by a willful or negligent violation of federal or state law should be deprived of a remedy if one exists under the federal Water Pollution Con-

trol Act and other appropriate laws. However, EPA must be made a party where the defendant can demonstrate it has acted in good faith.

16. Pollution Prevention

In addition to treatment policies, the federal government should develop, advocate, and institute pollution prevention measures. Prevention strategies are more effective in keeping toxics out of wastewater and far less costly than end-of-pipe technologies. Products containing chemical levels which constitute a significant percentage of the total loading should be restricted as to their composition and/or use.

17. Separate Storm Sewer Requirements

NLC continues to support a more simplified and flexible approach to management of municipal stormwater run-off which would allow for orderly and cost effective development of both information and program design than that which exists under current EPA regulations.

Congress should amend the Clean Water Act to regulate urban stormwater run-off under a newly-enacted provision of the Act separate from the NPDES program. Such regulations should require implementation of Best Management Practices (BMPs) to the Maximum Extent Practicable (MEP) with a legislative prohibition on requirements for end-of-the-pipe treatment: Management of run-off from municipal industrial facilities should be incorporated as part of a system- or jurisdiction-wide stormwater management program. Municipal compliance with stormwater management requirements should be based on implementation of site-specific Best Management Practices required in the permit.

18. Combined Sewer Overflow (CSO)

In establishing CSO guidelines, the federal government should use a technology-based approach determined on a case-by-case basis using best professional judgment weighing costs and benefits. The cost-benefit analysis should carefully consider the cost of CSO control, the intermittent and dilute nature of CSO discharges, the extremely large rate of the discharges, and the often remote locations of CSO outfalls against measurable benefits.

In controlling pollution from combined sewer overflows, EPA should develop a risk-based policy which implements controls and establishes implementation schedules based on the severity and/or frequency of pollution caused by overflows.

Technology-based requirements should not be assumed to involve end-of-the-pipe technology such as retention followed by conventional wastewater treatment. The technology-based requirements should provide for a wide variety of control techniques such as infiltration/inflow control, street sweeping, and conveyance away from sensitive environmental areas. Partial or total sewer separation should be phased in over time.

Municipalities shall be deemed in compliance once control plans and implementation schedules are in place, assuming the controls are appropriate and the schedule for implementation is maintained.

EPA should establish a "wet weather task force" of state and local government representatives to develop realistic water quality standards taking varying climatic and hydrogeological conditions into account.

Funding allocations should take into consideration a community's ability to pay and past local efforts to address the problem.

19. Non-Point Pollution

Congress and the Administration should proceed as expeditiously as possible through expanded research and development, technical and managerial assistance, and funding to aid the efforts of local and state governments in the control of non-point sources of water pollution.

Congress should authorize a new supplemental grant program for the funding of non-point source pollution abatement.

TESTIMONY OF GREG SMITH, CHAIRMAN, MUNICIPAL ASSISTANCE TASK FORCE, OHIO ENVIRONMENTAL PROTECTION AGENCY

Mr. Chairman, I am Greg Smith of the Ohio Environmental Protection Agency and Chair of the Association of State and Interstate Water Pollution Control Administrator's (ASIWPCA) Task Force on Municipal Assistance. As you know, ASIWPCA is the national organization of State officials who implement the Clean Water Act on a daily basis. Our Association is committed to the environmental ob-

jectives set forth in the law, and we appreciate the opportunity to appear before you today to present the states' Clean Water perspective.

Tremendous strides have been made in cleaning up and protecting the environment. Since 1972, States have gained considerable experience addressing Serious' water quality problems confronting the nation and we come to share that experience and expertise. The States' recommendations are premised on the following principles:

PRINCIPLES

1. *The Clean Water Act is fundamentally sound. Significant refinements should however, be made to address program effectiveness* including:

- Increased funding for State management
- Continued Federal capitalization of the State Revolving Loan Fund (SRF).
- Increased State flexibility to operate programs more efficiently and effectively, to maximize environmental results and undertake comprehensive approaches.
- Elevated USEPA priority on the program's fundamentals—(eg: up-to-date effluent guidelines and water quality standards.)
- Enhanced nonpoint source management programs in the States.

2. *States must continue to have the lead role* in program development and management. Delegation of NPDES and SRF programs are cost effective, managerially efficient and institutionally appropriate.

3. *Additional time is needed to carry out the 1987 Amendments.* Lack of funding, inadequate technical resources and late issuance of policy and regulatory guidance have created unnecessary delays which must be accommodated in any reauthorization.

4. *Any new mandates must be accompanied by increased funding above the current baseline.* Expanded flexibility for States to tailor their programs in the most efficient and cost effective manner is also essential.

RECOMMENDATIONS SUMMARY

Municipal pollution from treatment plants and runoff cause both localized and national environmental problems. Because these problems can be significant and chronic, the Association recommends the following actions to enhance the program and maintain momentum. The Bill introduced by Senators Baucus and Chafee represents a good starting point. The ASIWPCA membership is in the process of reviewing this Bill and our Association will compile comments at our August Annual Conference. Once that review is complete, we will forward our more detailed comments to you Mr. Chairman. At this time, we provide the following:

- \$5 Billion in Federal funding annually should be authorized and appropriated for the SRF in accordance with the needs mandated by the Clean Water Act.

Specific comments: Statutory mandates must be balanced to reflect a \$2.5 Billion SRF level. The Bill provides a \$2.5 Billion baseline, with the possibility of up to twice that amount if annual budget targets are met. While the States appreciate the Committee's continued support for the SRF, the historical track record in addressing deficit reduction leads one to question the likelihood of additional funds in the out years.

- States oppose any effort to expand eligibilities without significant additional funding, it cannot be overemphasized that \$2.5-5 Billion is *inadequate* to accomplish the requirements of the current statute.

- States are concerned that dedicated sources of revenue are essential to maintain the SRE, i.e. leveraging potential, maintenance of Fund corpus, and preservation of good State bond ratings. Any deviations from current law should be undertaken with State consultation.

- States *strongly* oppose the Bill's requirement that States go beyond their existing 20% match to, in effect, leverage in order to achieve a 100% match for Federal funds. We anticipate that a number of States will not be able to fully participate under such conditions and the Federal government, which has trouble balancing its own budget is in a most precarious position when attempting to dictate to the States in this regard. Leveraging must remain optional and should not be mandated arbitrarily by law. Several States have indicated that this proposal, if implemented, could "kill" their SRE Programs. Other States have refrained from leveraging until such time as major CSO construction is needed. Forcing States now to leverage will foreclose that option.

The State Revolving Loan Fund (SRF) Program should be streamlined and focussed on construction of priority projects, in the shortest time frame, at reasonable cost.

Specific comments: The States applaud the Senate's efforts to streamline the SRF program.

Small-hardship communities should be assisted under the umbrella of the SRF, in the form of principal subsidies.

Specific comments: The Senate Bill responds to the issue of affordability, but the universe of eligible projects is overly broad. The threshold criteria would be subject to manipulation and the emphasis on loan forgiveness limits State creativity and will, over time, significantly erode Fund corpus. States must have the flexibility to structure hardship programs to meet the specific needs in their State, in a manner that preserves the integrity of the SRF.

The Act should support the Agency's revised policy on controlling combined sewers.

Specific comments: The ASIWPCA supports the bill's effort to encompass USEPA's draft policy.

- The stormwater program should be revised to focus on priority water quality problems. Workable permit requirements must be the focal point.

Specific comments: The Senate Bill does create an opportunity to make progress in addressing problems with the current program. However, it does not go far enough.

KEY ISSUES

I. INFRASTRUCTURE FINANCING

To continue and strengthen the State/Local/Federal partnership, the Federal government needs to continue to financially assist communities in their effort to meet Clean Water Act mandates. The commitment in the 1987 Act to create and support the SRF has not been met. The challenge is to assure adequate funds and use the Federal funds available *efficiently/effectively* to *equitably* bring about municipal compliance. A successful strategy must outpace inflation on over \$200 Billion in existing needs. The SRF is the *only viable mechanism* to address inflation and continuing need, because it leverages Federal capitalization funds over 2-5 times while revolving in perpetuity for community use.

A. State Revolving Loan Fund

ASIWPCA enthusiastically supports the SRF and we recommend that *all* Clean Water infrastructure assistance be incorporated under the Title VI umbrella. Beyond question, the SRF has been the most successful program established under the 1987 Amendments. All 50 States have created and are successfully implementing SRFs. In a pioneering effort to "reinvent government", before the term became politically correct, the SRF was designed to reward initiative and compliance, rather than encourage delay. The experience of the States clearly documents that projects can be built cheaper (in half the time) than a project which has received a grant.

1. *Federal Funding:* Continued authorization funding support is needed for two reasons:

Traditional Needs: Under the 1987 covenant between Congress, the Administration and the States, the Act authorized \$18 Billion for municipal wastewater treatment, \$8.4 Billion of which was to capitalize the SRF for \$78 Billion in *pre-1987 Act* needs. Regrettably, Federal appropriations have fallen \$1.7 Billion short of the authorization States estimate that at a minimum \$2 Billion annually will be needed to adequately capitalize the SRF for pre-1987 requirements.

New Requirements: The 1987 Act mandated substantial changes that were not considered when the covenant was reached, which will significantly impact local governments related to:

- More stringent water quality standards (i.e. advanced treatment),
- Toxics control requirements,
- Sludge management,
- Stormwater permit requirements,
- Nonpoint source control,
- Estuary protection,
- Combined sewer overflow correction, and
- Rehabilitation of existing facilities which reached their design life.

ASIWPCA estimates that the total wastewater treatment needs of this nation in the next 20 years will exceed \$200 Billion. To adequately capitalize the SRF, further Federal capitalization funds are needed and well worth the modest investment required.

Recommendation: \$5 Billion should be authorized annually.

2. *Eligibilities:* The SRF is grossly undercapitalized to meet the already broad eligibilities in the current law.

Recommendation: There should be no expansion of eligibilities until the Fund is adequately capitalized to meet the \$200 Billion in currently estimated needs.

Specific comments:

- "*Subsurface sewage disposal*" and "*associated management organizations*" should be defined. Emphasis on subsurface will not encompass all systems needing attention
- *Careful analysis is needed before establishing further eligibility for individuals.* Otherwise, the Fund's corpus will be endangered.
- *The intent to limit assistance for discharge activities* should be explained and clarified.
- *Dedicated sources of revenue should be maintained, as Indicated above.*

3. *Formula and Needs Survey:* Because the Association represents all 50 States, it is impossible for ASIWPCA to take a position on the allotment formula. The Association, is however, concerned that the methodology be objective and reasonably attainable within the data, resources and time available. The Needs Survey has been difficult to complete because there are many projects involved and judgment calls have to be made. As nonpoint source and watershed plans evolve, needs will increase exponentially.

Recommendation: A more concerted effort should be made by USEPA to develop a credible and comprehensive Needs Survey. All needs eligible for SRF financing under the Act should be included.

Specific comments: The survey methodology envisioned (e.g. assessment for traditional categories as well as a costing out of watershed plans) is impractical. Short deadlines, limited resources and lack of data complicate an already complicated system. All needs envisioned can be effectively reflected under the current Needs Survey approach.

B. *Grants:* ASIWPCA does *not* support re-creation of a grants program for several reasons:

- States worked diligently to establish SRFs and involve communities in the program's creation. The resurgence of Title II grant funding undermines these programs and encourages communities to *hold out* for the possibility of a future grant. This delays compliance and it reinforces the notion that if they put off solving their problems long enough, the Federal government will come to the rescue. Grants send the wrong message and penalize progressive cities and towns which took initiative to address their responsibilities to meet requirements of the Law.
- In today's budgetary environment, *grants are no solution.* Annual funding would be required far in excess of \$10 Billion to make on *any* measurable progress nationally. This does not take inflation into account.

Recommendation: A Title II/grant program should *not* be re-established. The Association supports the Senate Bill's incorporation of that philosophy.

C. *Small Community Assistance:* Refinements are needed in the SRF for *small-hardship* communities, in a manner that preserves the Fund's integrity.

States track over 15,000 small communities, less than 10,000 population under the Clean Water Act—49% need wastewater construction over the next ten years of over \$10 Billion. Over *one-third* of SRF projects are for small communities. While many are financially capable, in approximately half of the States, more than 50% needing construction cannot afford the debt service on a SBF loan for *all* project costs. The smaller the community, the less viable the SRF appears to be. Additional assistance needs to be provided *under an existing program* administered by the States, with "one stop shopping".

Recommendation: Title VI should be amended to provide a *supplementary authorization* in Title VI for small hardship communities under which States are authorized to:

Define "small", since what is suitable in one State may not be in another.

Blend principal subsidies with SRF loans to achieve a target State level of project affordability.

Make planning, design, construction, and acquisition of land/easements eligible. Exempt recipients from Title II/Federal cross-cutting laws, including the Davis Bacon Act

Allow up to 40 years for loan repayment for projects less than \$10 Million

Enable States to use a generous amount of administrative funds for outreach/technical assistance.

Specific comments: The Senate bill makes progress. However:

- *States must have the ability to define affordability and community size*, so that there is no manipulation or circumvention of intent, the program is compatible with existing efforts and funds are targeted to communities in need.
- *Principal subsidies are much more desirable than loan forgiveness.* The Bill could not adequately protect fund corpus (which could erode quickly) or assure compatibility with leveraging. It would create built-in incentives to "gold plate" designs and carelessly manage finances.
- *States question whether is it appropriate for communities of more than 10,000 population to qualify.* The need in the smaller communities is well demonstrated and funds are limited. Forgiveness up to \$20,000,000 (by community for all time or by project—the bill is not clear which) or 20% of the capitalization grant could easily be reached with one project. Competition could easily crowd out less sophisticated small communities that are most in need of assistance.
- *The provisions on technical assistance are complex and may actually provide less incentives than current State efforts.* The objective is to get small communities into the process. Tying assistance to payback in a potential SRF loan or partial grants is not always an incentive and appears to compete with the private sector. It would be much simpler to increase the State administrative set aside.
- *The bill should extend the loan repayment period and eliminate application of other Federal laws* as much as possible.

D. State Revolving Loan Fund Program Refinements: Based on State experience with the SRF, implementation program enhancements are needed to expedite and improve program performance as well as make the program more attractive to the ultimate consumer, local governments:

- **State Administrative Costs**—As defined by USEPA, 4% of the capitalization grant is available for State program administration and no more. This is inadequate: 1) the accumulated size of the SRF is not considered, and 2) when capitalization grants end, so do funds for administration.

Recommendation: The 4% administrative allowance should be tied to the *authorization* level, with a minimum of \$400,000 per State. No limitation should be placed on other contributions to the Fund (e.g. using loan repayments, bond proceeds, State funds, or other monies).

Specific comments: Provisions would provide relief in States that are highly leveraged, in most (e.g. small, rural States) any increase in funding based on the new approach (0.5% of total capitalization grants and funds deposited) appears to be negligible.

- **Requirements**—Each Title II Federal requirement applied increases costs and construction time which is problematic in a loan program.

Recommendation: The Act should clarify that only requirements specified in their entirety in Title VI apply and:

- **Cross-cutters:** The many Federal cross-cutting laws should not apply.
- **Eligibilities:** Since the SRF was created to fund projects broadly eligible under Sections 212, 319, and 320, the 20% limitation in Title II on use of funds for collector sewers, rehabilitation, combined sewer overflows, etc., should not apply.
- **Title II:** Some Title II objectives have value, but States should have discretion to apply them as appropriate. At a minimum, the following modifications to Section 602(b)(6) are necessary. Delete:

Section 201(g)(5), Innovative/Alternative Analysis

Section 201(6)(g), Recreation/Open Space Requirements

The word "proportional" in Section 204(b)(1), User Charge Requirements

Mandatory value engineering in Section 218

Specific comments: States applaud the Committee for its efforts, but urge further simplification.

- **Land Eligibility**—The SRF should provide "one stop shopping".

Recommendation: Acquisition of land, easements and rights of way should be eligible. The States support the Committee's effort to do so.

- **Loan Amortization Period**—Loan terms should be more affordable.

Recommendation: States should have flexibility to extend the 20-year loan repayment period up to 30 years for small hardship communities and up to 40 years for those with projects less than \$10 Million.

Specific comments: More consideration should be given in the Bill to this issue as a mechanism to readily achieve affordability.

- Federal Oversight—There is no policy on the USEPA/Inspector oversight.
- Recommendation:* The bill should clarify the duration of oversight, particularly related to reviews and audits. States should be able to use the Single Audit Act to satisfy the law.
- Title II Closeout—This issue needs to be addressed.

Recommendation: States should be able to use Title II de-obligations and reallocations in the SRF. Title VI administration funds should not be used to close-out the grants program, since they are inadequate for long term SRF management.

Specific comments: Use of unobligated funds (which could be significant under the Bill due the leveraging requirement) should not be limited to replacement of failed innovative/alternative systems. There can be much more environmentally critical uses for the funds.

The Bill appropriately addresses Title II closeout under Section 205(g).

- Planning Setaside—This holdover makes no sense in a loan program.
- Recommendation:* The 40% Title II pass-through to local governments should not apply to Section 604(b) funds.
- Specific comments:* States oppose any additional setasides of SRF funds for other purposes. There are already too many funds setaside. Planning should be funded elsewhere.
- Consistency: Project consistency with plans developed under the law is desirable.
- Specific comments:* Funding for projects developed under past efforts (e.g. the Great Lakes Water Quality Agreement) should not be held up or delayed while entities endeavor to develop watershed plans.

COMBINED SEWER OVERFLOWS (CSOs)

Through intense negotiations between cities, States, environmental groups and USEPA, the CSO program is now heading in the right direction and should be supported.

Efforts to address CSOs have been stymied by lack of understanding of the problem, inadequate funding and lack of consensus on a workable approach in a reasonable timeframe. The agreement reached recently under the USEPA Management Advisory Group by the Agency, provides a workable format for addressing national policy for CSO deadlines and program requirements.

Recommendation: The Clean Water Act should support the national policy. The Association supports the Senate Bill's effort in this regard.

Specific comments: NPDES delegated States should have the same authorities throughout the provisions as the USEPA Administrator. The law should recognize that in some instances the deadlines envisioned would be overly generous. Efforts to update bacteria standards should be addressed by requiring USEPA to update Section 304(a) criteria. Withholding permits is a circuitous route to addressing this complex issue and municipalities could be unduly exposed to citizen suits.

STORMWATER

ASIWPCA supports the Act's stormwater control objectives. However, the program should be refined so that it does not overwhelm and/or undermine the State NPDES permit program, Congress must recognize that there is a extremely large number of additional NPDES sources to be addressed (e.g. some States estimate that stormwater permits will exceed permits issued under NPDES by ten-fold.)

Requirements need to be more consistent with the funding available and expected water quality benefits. The most significant sources should be addressed first. All parties should clearly understand expectations.

Recommendation: The first round of permitting should emphasize specific control levels, followed by water quality assessment to identify needed additional actions based on standards. A realistic schedule is needed that phases implementation of regulatory programs:

- For municipal dischargers, controls that reduce discharges to the *maximum extent practicable* should be required.

- For industrial dischargers, the first round permits should require implementation of BMPs.
- Permits should not be required for municipalities less than 100,000 population, unless the discharge significantly contributes to pollution or the town is served by a separate stormwater system with a total population of 100,000 or more.
- Permits should not be required for industrial indirect discharges to permitted municipal separate storm sewers, unless the discharge is in violation of local requirements and an individual stormwater permit is needed.

Specific comments: The provisions make significant progress clarifying control requirements and their relationship to water quality standards. Although the intention was to more discretely focus the program on water quality problems, the Bill falls significantly short of that objective.

- Some provisions are confusing.
- There is overly broad inclusion of municipalities in SMSAs and source categories.
- Requirements would often be extremely resource intensive and difficult to justify based on the arbitrary boundaries and likely water quality improvements.
- The wet weather monitoring requirements would be extremely costly and would not consider or identify some important pollutant sources, such as air born pollutants.

SUMMARY

Mr. Chairman, the Association appreciates your leadership, and that of Senators' Baucus and Chafee, in providing a legislative vehicle for national debate on Clean Water. As you proceed to refine the bill, ASIWPCA and the States look forward to working closely with you and your staffs. I am delighted to answer and questions.

TESTIMONY OF EDWARD WAGNER, DEPUTY COMMISSIONER, NEW YORK CITY DEPARTMENT OF ENVIRONMENTAL PROTECTION

SUPPORT FOR THE CLEAN WATER ACT

Mr. Chairman and members of the Subcommittee, I am Edward Wagner, Deputy Commissioner of the New York City Department of Environmental Protection. I appear before you today representing the Association of Metropolitan Sewerage Agencies (AMSA). AMSA's members represent the nation's largest wastewater treatment agencies. We serve the majority of the sewered population in the United States, and collectively manage over 14 billion gallons of wastewater each day.

I am pleased to be here today to provide our perspective on the reauthorization of the Clean Water Act, and the recently introduced Water Pollution Prevention & Control Act of 1993, S. 1114. We sincerely appreciate the opportunity to share with you our thoughts and recommendations as environmental practitioners dedicated to protecting and improving the quality of the nation's waters.

AMSA supports the reauthorization of the Clean Water Act and its goal of fishable and swimmable waters. AMSA believes that this reauthorization must use an integrated and comprehensive strategy that establishes new priorities for achieving water quality goals. It must recognize the wide range of conditions present in our nation's watersheds and provide flexibility to decision makers so that they can address site-specific conditions. It must target all impediments to ecosystem health. It must develop mechanisms for control that properly balance environmental gains and their cost-effectiveness. And it must provide the funding to implement its clean water mandates.

While this is AMSA's vision of a reauthorized Clean Water Act, we also acknowledge, in our initial review of S. 1114, that the Senate legislation goes a long way toward realization of these goals. AMSA's concerns and priorities are present in the bill and reflected in its language. We commend Senators Baucus and Chafee for introducing legislation that clearly moves our national clean water program forward. AMSA has recently initiated a detailed review process of S. 1114 and will be reporting our specific comments and recommendations to the Subcommittee in the coming weeks.

PUTTING THE REAUTHORIZATION INTO PERSPECTIVE

First and foremost, it is important to put reauthorization of the Clean Water Act into an historical perspective. This nation, its states, cities and towns have made

enormous progress in the more than 20 years since the passage of the 1972 Clean Water Act.

In 1972, national standards that targeted point sources made sense because we had identifiable problems traceable to easily controlled sources. Congress provided funding, necessary deadlines and enforcement mechanisms. Coupled with a considerable amount of public support and motivation, this set the stage for our nation to successfully address many of its clean water challenges.

Today we face new challenges. While public support for environmental progress and improvement continues, the new and emerging issues we must address are more complex and costly. The control of combined sewer overflows and the management of stormwater and nonpoint sources of pollution provide excellent examples of new clean water priorities. Today, fiscal shortfalls at every level of government are unprecedented, which make dollars harder to get.

RECONCILING OUR CONSTRAINTS, OUR EXPECTATIONS AND OUR NEEDS

In a reauthorized Clean Water Act we need to reconcile the constraints of the 1990's with our continued high expectations and the need to make continuing progress.

Funding

Reconciling constraints with expectations within the context of the Clean Water Act will involve several things, the first of which is an increased and ongoing Federal financial commitment, in partnership with state and local governments. Attached to my testimony is a report AMSA has published called "The Cost of Clean". Among the key findings of the report are the following:

- Funds totalling over \$23 billion will be required for AMSA's member agencies to meet currently mandated clean water needs to the year 1995;
- We can expect operation & maintenance costs—which are paid totally by local government—to double every eight years;
- Historical data allows us to project that annual household user fees will, at a minimum, double every six years; and that
- Currently, local governments pay 80-90% of the "Cost of Clean".

I believe that we—my colleagues on this panel and the members of this distinguished Subcommittee—should work together to keep the Federal feet to the fire. We must not lose sight of the fact that the Clean Water Act sets forth a national program with an integral relationship to our nation's long term environmental health and economic growth.

The State Revolving Loan Fund Program (SRF) provides an excellent framework to fund our national clean water program. It is, however, a program that can be made exceedingly better with adequate funding, streamlined requirements, competitive rates and increased flexibility to allow both grants *and* loans. AMSA urges the Subcommittee to use this reauthorization as an opportunity to reassess the program and make it more responsive to this country's needs and goals.

The funding provisions in S. 1114 make important progress toward improving the viability of the SRF program. The legislation's expanded eligibilities and significant incentives should not go unrecognized. AMSA lends it support to S. 1114's provisions acknowledging the special needs of "disadvantaged communities" and endorses the bill's recognition that "disadvantaged communities" can come in all sizes.

Each of these actions represent significant forward progress; however, our survey, and many others like it, document the need for high levels of Federal funding to support the Clean Water Act. We cannot overemphasize the fact that local governments cannot go it alone when it comes to funding our national clean water priorities.

We're as committed as you are to aggressive progress in the clean water program; however, the kind of progress we're striving for comes with a high price tag and will require a doubling of Federal dollars for the clean water program. AMSA's long term funding position is attached to my testimony. You'll note that the Association calls for a \$6 billion dollar a year Federal commitment to clean water. This is not an estimate pulled from the sky, but an accurate reflection of our national funding needs to effectively meet existing requirements. I hope you will agree with me that Federal government support is essential to meet the environmental challenges we face as a nation.

Combined Sewer Overflow Control

The next step in reconciling constraints with expectations is for all of us to refocus our concerns and priorities. We need to resist the temptation to set unrealistic

deadlines and prescribe national solutions to local problems. Prescriptive national solutions do not, by their nature, provide the level of flexibility necessary to consider site-specific circumstances and result in the unnecessary expenditure of ever more scarce resources.

In support of this recommendation for necessary and desirable flexibility, I offer the following example. U.S. Environmental Protection Agency finalization of a draft National Combined Sewer Overflow Control Policy is anticipated this Fall. The policy—developed as a result of a stakeholder negotiation process in which AMSA took part—provides the balanced level of direction local communities have needed to proceed with CSO controls. In this policy, national direction is coupled with sufficient flexibility to consider site-specific variables. It is a welcomed solution to a complex problem—and one that resulted in an alliance of support between the Environmental Protection Agency, States, cities and the environmental community.

AMSA was gratified by the support for the National Combined Sewer Overflow Control Policy reflected in S. 1114, the Water Pollution Prevention & Control Act of 1993. The bipartisan recognition of the need to support this Policy, in the reauthorization of the Act, is well-founded and will result in environmentally sound CSO control nationally—without breaking the financial backs of local governments. The national policy, in concert with the legislative language in S. 1114, will allow responsible, effective CSO control to proceed. AMSA urges you to fully support, without further amendment, the combined sewer overflow provisions in S. 1114.

Stormwater Management

Some of my colleagues on this panel will have much more to say than I about S. 1114's approach to the important issue of stormwater management. AMSA would, however, like to speak in support of S. 1114's recognition of the effectiveness of best management practices in the control of stormwater, and endorse the legislation's movement away from the requirement of numeric water quality limits in stormwater permits.

THE SEARCH FOR A SOLUTION

There is a very important temptation that we—as a nation—must resist. I speak of the propensity to attempt to fix programs that aren't broken. There's an old adage, "If it isn't broken, don't fix it." That adage applies to many of the programs within the Clean Water Act. AMSA was gratified to see this approach taken by the drafters of S. 1114. The legislation represents a vast improvement over that which was under consideration during the 102nd Congress. The Committee and staff are to be commended.

The attention paid in S. 1114 to many long standing programs, as well as the important areas of pollution prevention, water conservation and, of course, comprehensive watershed management is a notable improvement. While AMSA will have constructive recommendations to improve and strengthen the bill, the legislation represents a significant step forward.

Comprehensive Watershed Management

AMSA views a national program for comprehensive watershed management as the best way to link limited resources with continued environmental improvements.

Our Association spent much of the last two years coming to one clear conclusion—that comprehensive watershed management, as a means to achieve our national water quality goals, makes a lot of sense. AMSA was gratified to see, in provisions of S. 1114, that the leadership of the Senate Environment & Public Works Committee shares this significant conclusion.

With our testimony we have provided you with the Principal Tenets that guided the development of the proposed legislation we have drafted entitled, the Comprehensive Watershed Management Act of 1993. The vision contained in the Comprehensive Watershed Management Act of 1993 calls for the development of comprehensive watershed management plans with the participation of all point sources, nonpoint sources, users of the watershed, citizens and levels of government.

As AMSA envisions it, the process for restoring watershed ecosystems follows rationally from a scientific analysis of site-specific conditions and the technologies available to improve those conditions. Priorities are established based on the quality and use of receiving waters, ecosystem health, and the sources of pollutants that legitimately threaten the watershed. AMSA believes that comprehensive watershed management planning must emphasize establishing priorities, maintaining flexibility and empowering local, regional and state government and the affected community-at-large to solve their unique problems.

The comprehensive watershed management language contained in S. 1114 takes a important step in the right direction. In particular, AMSA would like to commend the bill's authors for the significant incentives for watershed planning in the legislation.

AMSA believes that comprehensive watershed management should be the new foundation for the future direction of our Nation's clean water program. AMSA looks forward to working with you to broaden and strengthen the watershed provisions in S. 1114. We hope to share our specific recommendations in future testimony before you, Mr. Chairman, when the Subcommittee focuses specifically on the issue of comprehensive watershed management in July.

CONCLUSION

In conclusion let me suggest the following. We need to consistently search for better ways of doing things—more flexibility and more attention to site-specific variables, a better public awareness of what the problems are, the importance of solving them, and the best solutions. Local consensus-building must become an essential step in the framework for reaching the environmental milestones we set.

In short, we must strive toward a better understanding of the most effective, yet pragmatic, means through which we can accomplish our national clean water goals. There has to be a measurable and meaningful return for our investment.

As we shift our attention toward fully restoring our watershed ecosystems, we all recognize that we have a long way to go. No one ever suggested that the task of improving and protecting the nation's waters would be an easy one—however, working together, I know we can succeed.

Again, AMSA will be providing detailed comments and recommendations regarding S. 1114, the Water Pollution Prevention and Control Act of 1993, in the coming weeks. We look forward to working closely with this Subcommittee, the Environment & Public Works Committee and the Senate as they proceed with reauthorization of the Clean Water Act.

This concludes my testimony. I would be pleased to answer any questions you may have.

Attachments: The Cost of Clean

Long Term Funding Position Statement

Principal Tenets—

The Comprehensive Watershed Management Act of 1993

LONG TERM CLEAN WATER FUNDING

MARCH, 1993

AMSA believes long term Federal funding for the nation's clean water program at a level of \$6 billion/year is essential to continued environmental progress. Clean water funds should be provided through a combination of direct grants to municipalities and capitalization grants to states for State Revolving Loan Funds (SRF). The source of these funds would be general fund revenues and newly generated dedicated revenues.

The funds would be disbursed through an equivalent combination of direct grants to municipalities (at 50% of the total funds provided) and capital grants of the remaining 50% to SRFs for loans. The allocation of grant funds within each state would be determined on a state-by-state basis.

These funds would be used to support the efforts of the nation's communities to meet current and emerging requirements of the Clean Water Act, including upgraded treatment, combined sewer overflow control, stormwater management and the rehabilitation and replacement of facilities.

Funding for other local environmental infrastructure construction, particularly that related to Safe Drinking Water Act requirements, should be provided in addition to clean water funding for wastewater facilities construction needs.

BACKGROUND

AMSA believes that the Clean Water Act's historic focus on technology-based standards and end-of-pipe treatment, framed by aggressive schedules for compliance and supported by significant federal funding, has achieved enormous reductions in the pollutants discharged to our nation's waters. These successes would have been impossible without one element in particular—the significant Federal support provided through the Construction Grants Program.

The fact of the matter is, the grants program worked. Federal, state and local monies provided the impetus to improve and protect our nation's waters. Today, significant needs remain. Wastewater construction needs to meet mandated requirements of the Clean Water Act remain at significant levels. An estimate based on the U.S. Environmental Protection Agency's 1990 Needs Survey places total unmet needs at \$110 billion. This total includes \$25 billion for unmet secondary treatment needs. In addition, combined sewer overflow control needs, reported at \$16 billion 1990, could potentially total as much as \$200 billion, depending on National Pollutant Discharge Elimination System (NPDES) permit requirements. Compliance with federal stormwater NPDES permit requirements and water reclamation and reuse projects will result in needs in addition to these amounts.

AMSA's Financial Survey and *Cost of Clean* report document that annual household user fees are doubling every six years and are projected to increase at a greater rate in the future due to increased construction, operation, maintenance and financing costs for existing and newly mandated requirements.

Recognizing the budgetary constraints existing at all levels of government, we must manage environmental expenditures carefully to achieve the greatest benefit for the dollars available for investment. As we look to FY 1994, our focus must shift to a more comprehensive approach, addressing the control of costly, more complex and diverse sources of pollution. One thing, however, must not change. Continued federal funding of projects mandated by the Act is critical to the ultimate achievement of national water quality goals.

Further, AMSA believes that federal financial assistance is required to support research and development for a sound, scientific basis in the development of a water quality-based pollution reduction strategy. Federal financial assistance is also necessary to support state administrative costs and the development of comprehensive, site-specific, pollution reduction strategies.

PRINCIPAL TENETS OF THE COMPREHENSIVE WATERSHED MANAGEMENT ACT OF 1993

1. The overall objective of comprehensive watershed management planning is to make cost-effective, site-specific decisions that achieve water quality objectives that protect the designated beneficial uses of a watershed.
2. Science must be the basis for public policy decisions.
3. All players must be at the table to equitably address future water quality objectives.
4. Local government and publicly-owned treatment works must have an active role in establishing water quality objectives for the watersheds in the which they are located.
5. Local stakeholders (government entities, sources of watershed impacts, users of the resources within the watershed, the public and others with a specific interest in how the watershed is managed) must have the clearly stated opportunity to provide recommendations and direct advice and counsel to the Governor regarding the designation of their watershed boundaries and the makeup of its Commission.
6. Progress on water quality improvement, including minimum standards of operation (MSOs), must continue as comprehensive watershed management planning moves forward. Until a watershed management plan is completed, permitting agencies that are responsible for National Pollutant Discharge Elimination System (NPDES) permits must take into account those sources within a watershed that cause water quality impairment and must accordingly exercise flexibility and discretion in exerting their regulatory authority in setting effluent limits and compliance schedules, and in conducting enforcement activities.
7. Time frames for completing a comprehensive watershed management plan must be realistic.
8. Implementation of elements of the comprehensive watershed management plan must be verified and enforced to assure equity among all sources or categories of sources of pollutants of concern in a watershed.
9. The scheduling of compliance with Clean Water Act requirements and prioritization of resources to achieve water quality objectives shall be guided by watershed plans. One expected outcome of an approved watershed management plan is that NPDES terms, conditions and limits shall be modified as appropriate to cost-effectively achieve the water quality objectives of the plan.
10. Comprehensive watershed management planning and the federal/state legislative and regulatory framework shall be compatible and fully integrated.

TESTIMONY OF ROBERT W. ADLER, NATURAL RESOURCES DEFENSE
COUNCIL, INC.

Mr. Chairman and members of the committee:

Thank you very much for this opportunity to appear today to testify on funding and municipal pollution issues in Clean Water Act Reauthorization. My name is Bob Adler. I am a Senior Attorney and Director of the Clean Water Project of the Natural Resources Defense Council, Inc. (NRDC).¹ I also chair the Steering Committee of the National Clean Water Network, which has over 420 groups nationwide working together to strengthen the Clean Water Act.² Also with me today is Diane Cameron, an environmental engineer at NRDC, to answer any technical questions about stormwater.

I would like to commend Senator Graham for scheduling this comprehensive series of hearings; and Senators Baucus and Chafee for introducing S. 1114, which will serve as an important starting point for most of the issues that will be addressed during these hearings. A number of other important and commendable bills have been introduced by other members of this Committee, such as S. 815 by Senator Lieberman on the National Estuary Program, and S. 997 by Senator Lautenberg on beach protection.

INTRODUCTION AND SUMMARY

Significant progress has been made over the past twenty years to reduce water pollution from municipal sources. Yet municipal pollution remains among the most daunting challenges facing water quality officials around the country for two reasons. First, the cost of municipal pollution control remains high at a time when federal, state and local fiscal resources are becoming increasingly scarce. Second, the intermittent but severe pollution that occurs in cities around the country every time it rains, from both separate and combined sewer systems, has not received the same attention as traditional sewage discharges.

NRDC strongly supports efforts to increase funding for Clean Water Act programs. It is essential, however, that if more federal dollars are spent on pollution control, the public be assured that it is purchasing more, not less, environmental protection. This means that we must find better, more efficient ways to spend our pollution control dollars. We must seek solutions to CSO and stormwater discharges that are cost-effective, without turning our backs on the serious human health and environmental problems caused by those releases. And increased federal funding of pollution control programs must be accompanied by increased accountability to the public that more environmental protection will result.

For these reasons, NRDC and other environmental groups worked closely with the Association of Municipal Sewerage Agencies last year, to negotiate a rational framework for resolving CSO problems in a cost-effective way. While the municipal officials who were party to those negotiations were consistent in their defense of municipal budgets, they chose to seek a solution that would nonetheless result in significant environmental progress. This process was laborious, consuming many long and frustrating hours of discussions. Ultimately, however, we reached a landmark agreement on CSOs, and are extremely pleased that the results of this negotiation are included by reference in S. 1114.

By sharp contrast, we were extremely disappointed to learn that the approach to stormwater control in S. 1114 undercuts, rather than supports, ongoing efforts to negotiate a reasonable solution to municipal stormwater problems. For the past year, NRDC and other environmental groups have been engaged in detailed discussions with the California Stormwater Quality Task Force, the National Association of Flood and Stormwater Management Agencies, and others in an effort to reach consensus on a workable, nationwide municipal stormwater program. While it is impossible to predict the success of such negotiations in advance, I believe it is possible to reach an accommodation which is satisfactory to all interests. By proposing to exempt large categories of municipalities from stormwater permits, however, and by weakening substantially stormwater control requirements for even the largest of cities, we fear that the stormwater provision of S. 1114 will now repolarize the stormwater debate. Municipal stormwater officials may no longer feel a need to compromise. At this point, NRDC and other environmental groups believe we will have to oppose the stormwater provision of S. 1114. Therefore, we urge Senators Baucus and Chafee to reconsider section 402 of S. 1114.

Finally, there are a number of concepts, not currently included in S. 1114, which could contribute the more cost effective use of federal water pollution funding. These include incentives for least cost water planning, to assure that water conservation investments are assessed on an equal basis with increased capacity; improved

incentives for innovative and alternative water pollution control techniques, especially where they result in reduced construction as well as operations and maintenance costs for small communities; and set-asides in SRFs for programs that are consistent with sound watershed plans, as suggested, for example, in Senator Lieberman's NEP bill, so long as firm mandates exist for implementation of those plans.

I. THE NEED FOR INCREASED, MORE EFFECTIVE CLEAN WATER FUNDING

A. Shortfalls in Clean Water Funding

The federal government has invested tens of billions of dollars in municipal sewage treatment since 1972,³ with total federal, state and local expenditures of over \$130 billion. These investments gained impressive results. The percent of the U.S. population served by wastewater treatment plants jumped from 42% in 1970 to 67% in 1975, 70% by 1980, and 74% by 1985.⁴ As of 1988, 58% of the U.S. population was served by plants providing secondary treatment or better.⁵ EPA estimates that annual release of organic wastes have been reduced by 46% as a result of this improved treatment, despite a large increase in the amount of wastes treated.

The same measure viewed from the opposite direction, however, shows a glass only half full. By 1988, public sewer systems serving 26.5 million Americans provided less than secondary treatment, and 1.5 million people had *no* treatment, discharging raw sewage into public waters.⁶ About 70 million people were not served by Public sewers at all;⁷ while many of these people have properly designed and maintained septic systems, others have in-ground systems that leak pollutants into surface or groundwater.⁸ In 1990, EPA estimated that the cost of meeting these additional municipal treatment needs through the year 2010 would exceed \$110 billion (in 1990 dollars).⁹ The EPA Needs Survey, moreover, does not account fully for funding needed to address pollution from CSOs. Estimates of the cost of addressing this problem are as high as an additional \$80 billion.¹⁰ Other important clean water programs, such as the requirement for cities to develop comprehensive programs to control polluted urban runoff, impose additional costs on many communities. Cities estimated that they spent \$130 to 140 million nationally to prepare stormwater permit applications, and that compliance costs will be higher.¹¹

Judged by these investment needs, while our municipal pollution control efforts have taken a giant step since 1972, we are still only half way to our destination. Some of these needs are for advanced treatment systems to reduce discharges of nutrients; but others are still to tackle ongoing releases of raw sewage into the Nation's waters.

In addition to these project needs, federal, state and Tribal water quality management programs around the country require increased funding as well. For example:

- EPA funding has not grown as fast as the proliferation of Congressional mandates. EPA's operating budget was slashed badly in the early 1980s. While some amends were made in the late 1980s and early 1990s, EPA's overall operating budget grew by only 25% (in constant dollars) from 1981 to 1992, a time during which major new environmental laws were passed or in early phases of implementation (such as Superfund and RCRA), and others were expanded dramatically (including the Clean Air and Clean Water Acts).¹²
- State and tribal water quality programs also are underfunded. The States have identified a \$400 million shortfall in the funding they believe is necessary to manage state water quality programs. Native American Tribes believe an additional \$40 million is needed for tribal water resource programs nationally.¹³

While the high cost of municipal pollution control is felt all over the country, cities at the extreme ends of the size spectrum appear to be hardest hit:

- Some of the highest sewage treatment bills are concentrated in a few large cities, such as New York (estimated \$10 billion in needs), Los Angeles (\$5 billion), Cincinnati (\$2.5 billion), Sacramento, Boston, San Diego and Seattle (each above \$1 billion). Rate hikes in these cities could have serious impacts on urban poor populations.¹⁴
- Other severe funding problems occur in small, rural communities where lack of access to bond markets and diseconomies of scale make modern sewer systems difficult to afford.¹⁵

B. The Case for Increased Federal Funding for Clean Water

Available public opinion data shows that Americans support stronger water quality protection overwhelmingly. In its Fifth Annual survey of the best places to live in America, MONEY Magazine ranked what Americans most want in a city. The most highly-valued characteristic was clean water. The local leisure activity with

the highest rating was access to a lake or ocean.¹⁶ Both measures indicate the high value Americans place on the quality of our water resources.

More rigorous surveys underscore the public's concern about water pollution. In a 1992 Roper poll, water pollution topped the list of the most serious environmental problems, with 77% of the respondents agreeing that water pollution was one of the "most serious" problems. An even higher percentage (79%) believed that current water pollution regulations do not go far enough in protecting public resources.¹⁷

A comprehensive review of over 500 public opinion surveys conducted since 1974¹⁸ confirms that the public ranks water quality high among environmental problems. According to this survey, most people believe water quality problems are getting worse, and the percentage of people who share this view has increased since the Clean Water Act was passed.¹⁹

Meeting our water pollution needs will be expensive, but it is useful to put these costs in perspective. As a nation EPA estimates we spend less than half of the money on environmental protection that we spend on clothing, a third of what we spend on defense and medical care, a fifth of what we spend on housing, and a sixth of what we spend on food. Moreover, while environmental investment has been increasing over the past two decades, it is actually declining as a percentage of our total capital investment, that is, we invest a smaller percent of our money in the environment than we did several years ago.²⁰

As a second perspective, in 1992 Congress (through the Intermodal Surface Transportation and Efficiency Act (ISTEA)) agreed to federal spending of roughly \$30 billion a year over five years to improve highways and other forms of surface transport. While this spending may be justified, it is ironic that we spend 15 times as much each year to build and restore our artificial railroads and highways as we do to protect and restore the natural riparian highways that served as America's original, natural transportation system, and provide us with so many other economic and ecological benefits as well.

Finally, by not investing in clean water, we are also losing access to potential jobs. Different sources indicate that investment of \$1 billion in water and wastewater infrastructure will generate between 6,400 and 15,600 jobs directly involved in project completion. Estimates of indirect effects could be as large as 13,600 jobs per billion dollars invested. Total effects, including direct, indirect, and induced have been estimated at 34,200 to 57,400 jobs per billion dollars invested. And, the estimated \$8.3 billion (1991 dollars) shortfall in funds for water and wastewater capital for the period 1993-2000 could represent 2,865,900 to 4,810,000 job-years of employment.²¹

According to the Maryland Institute for Ecological Economics, even more jobs can be created by investing in "natural infrastructure," through the restoration of wetlands, streambeds, fisheries habitat, and other essential components of aquatic ecosystems. These economists predicted that investments in aquatic ecosystem restoration would produce an average of 30 jobs per million dollars spent, a higher job creation rate than generated through public investment in roads (37% higher), water and sewer systems (24% higher), and major defense contracting (28% higher).²² The National Academy of Sciences proposes a long-range program to restore America's badly-degraded aquatic resources.²³ Investment in such a program could generate tremendous long-term ecological as well as economic benefits.

Increased public spending to protect and restore our aquatic ecosystems, then, produces multiple public benefits. Most important, it will help to provide cleaner water and healthier habitat for fish and wildlife. This, in turn, can improve human health and restore fish and wildlife populations that are valuable for their own sake, and support important industries as well. Incidentally but also important, public investment in clean water also creates jobs in many sectors of the economy.

C. Proposals to Improve the Use of Federal Dollars

If additional federal dollars are spent on water pollution programs around the country, the public should be assured that its tax dollars are being spent wisely. The following proposals would help to ensure that federal funding of SRFs will be used as cost-effectively as possible.

1. Least Cost Water Planning

We welcome the recognition of water conservation as one of the new water pollution control strategies highlighted in the Findings of S. 1114. Additionally, section 403 of the bill would authorize technical assistance on water conservation to communities and businesses, and the establishment of a national clearinghouse on water conservation technologies. Both of these are useful steps, but they fall far

short of the nation's need to bring cost-effective water conservation measures quickly on line.

Simply put, water conservation is dollar conservation. In recognition of the huge costs that remain before us to achieve our water quality objectives, Title I of the bill would extend and increase Federal financial assistance to States for aid to publicly-owned treatment works. Given the enormity of the job remaining to be done, the Federal taxpayer has a strong interest in making sure that limited dollars are spent effectively.

Under these circumstances conservation opportunities should be carefully weighed by each claimant on Federal funds. Many of the costs of wastewater collection and treatment are closely related to the quantity of wastewater flows that must be handled. This is true for capital costs, as well as operating costs. Communities from San Jose to New York City are finding that investment in water conservation can reduce the need for investment in wastewater treatment, on a cost-effective basis.

We recommend that communities seeking financial assistance from state revolving funds for purposes of expanding wastewater treatment capacity be required to prepare an "integrated resource plan." This approach to planning is gaining widespread acceptance among electric utilities and state regulatory agencies. Integrated resource planning involves the evaluation and comparison of a wide range of measures to improve efficiency, whether on the customer's side or the utility's side of the meter. Measures that reduce demand are compared with measures that increase supply for a given service—in this case, wastewater treatment. Integrated resources planning would also seek to identify opportunities for saving costs for water supply systems as well. The product of such a plan is a project or projects that will reduce the life-cycle costs and environmental costs to society. Where water conservation is not cost effective, it is not part of the project.

We also recommend that the eligibility criteria for the use of state revolving funds be clarified for water conservation projects. Where water conservation measures are found to reduce the capital or operating costs of wastewater treatment, they should be eligible for funding by the states.

2. Targeting Funding to the National Estuary Program and Similar Watershed Management Programs

The National Estuary Program (NEP), added to the Clean Water Act (as section 320) in 1987, allows the Governor of any state to nominate an estuary as an "estuary of national significance." If EPA finds that supplemental controls are necessary to attain the water quality goals of the Act, these estuaries are eligible for funding to convene a conference to develop a comprehensive management plan for the estuary. Congress initially designated eleven estuaries for priority consideration, and the program has now grown to include 17 estuaries around the country.²⁴

Management conferences are intended to assess trends in water quality and natural resources; evaluate pollution and other sources of impairment; and develop and implement comprehensive corrective actions to restore and maintain the chemical, physical and biological integrity of the estuary. Designed as a participatory process, NEP management conferences are to include representatives of affected states and foreign nations; federal agencies; local governments; and affected industries, educational institutions and the public.

The NEP strives to be a true comprehensive watershed initiative, instructing that all sources of impairment be assessed and remedial actions designed and implemented to tackle these problems. However, NEP suffers in scope and ultimate commitment to implementation. The 21 estuaries now included in the program, for example, represent just a third of the estimated 35,624 square miles of estuaries in the country.²⁵

More important, while section 320(f) (2) of the Clean Water Act states clearly that "[u]pon approval . . . such plan shall be implemented," the law includes no firm way to ensure that the public will get appropriate action for its money. First, while the provision identifies items that must be considered in developing a plan, few specific mandates limit EPA's ability to approve management programs as sufficient to meet the requirements of the Act; and no provision requires that, as Congress intended, the program be used to go beyond the existing (non-NEP) requirements of the law. Second, future NEP grants are not conditioned on actual implementation of management plans. EPA reported in April, 1992, over five years after the program was created, that only two of the estuary conferences (Puget Sound and Buzzards Bay) had completed management plans and moved fully into the implementation phase.²⁶

In order to make NEP a working rather than a paper model for watershed protection, Congress should:

1. *Mandate implementation and fixed time-frames.* After development of the CCMPs there is no firm requirement that the plans be implemented. In addition, the planning process itself is often unnecessarily stalled and, therefore, extends well beyond its five year limit. To date, the National Estuary Program has been generally successful at identifying water quality problems. However, it is essential that the program move from problem identification to implementation of the solutions to these problems. Section 320 of the CWA should be amended to extend the program, but with strict requirements for the plans to be implemented in a timely way. Federal financial assistance should be provided to assist in the effort. Deadlines are necessary to ensure that individual members of the management conference are not able to stall the entire process.

2. *Expand the role of the EPA.* The role of the EPA, as an active participant and as a coordinator of the appropriate environmental agencies, has not been consistent in each of the projects nor has its level of commitment to the NEP. Section 320 of the CWA should require the EPA to take on a more aggressive leadership role in assisting the program to fulfill its goals. Actions taken by the EPA need to be coordinated better with the Governor's office and state coastal zone management offices. States should also be required to adopt the stronger (or more protective) of their own state coastal management and environmental protection plans or the final CCMP.

3. *Increase citizen participation.* Citizen participation during the development of the CCMPs is often inadequate, as is the funding necessary to accomplish this goal. Section 320 should be strengthened by requiring citizen participation in all aspects of the CCMP process. Public hearings should be held on a regular basis throughout the life of the program. Funding is needed to ensure full citizen participation and for public education efforts.

4. *Establish a Funding Mechanism for State Implementation.* Due to state budget shortfalls and lack of federal support, many states have not been able to follow through on their CCMPs; therefore, there is no guarantee that these plans will ever be implemented, monitored, and enforced. The Clean Water Act should include a funding mechanism to ensure that the states are given federal assistance so that the CCMPs can be implemented, enforced and closely monitored. Federal funds also provide an incentive for states to undertake the more politically difficult task of putting the planning elements into practice. States are eligible to receive CCMP implementation funds under the State Revolving Fund (SRF) program, however, current appropriation levels are severely inadequate to meet the growing demand for funding.

S. 815, introduced by Senators Lieberman, Dodd, Moynihan and O'Amato, would increase NEP funding contingent on resolution of many of these problems. The Lieberman bill, however, is just one example of watershed-based planning that can be used to target the use of SRF dollars. Similar tools should be used to direct the use of funding in other types of water bodies around the country, as an incentive for sound watershed-based planning and management. However, as with the Lieberman bill, set-asides for such funding must be made contingent on firm assurances that plans will be implemented properly, and not just used for endless planning.

II. THE NEED FOR EFFECTIVE STORMWATER AND CSO CONTROLS

A. URBAN STORMWATER

1. STORMWATER CAUSES SERIOUS ENVIRONMENTAL PROBLEMS

Members of this Committee are well aware of the serious problems caused by polluted stormwater runoff. During debates on the 1987 Water Quality Act Senators Mitchell and Chafee noted:

Runoff from municipal separate storm sewers and industrial sites contains significant volumes of both toxic and conventional pollutants, including 13 toxic metals, in the discharge from municipal separate storm sewers that were studied. Of these, lead, copper, and zinc were the most pervasive; EPA found these pollutants in at least 91 percent of its samples. The same study also estimated that municipal separate storm sewers discharge 10 times the total suspended solids that the Nation's secondary sewage treatment plants discharge.

Toxic and conventional storm water contaminants may adversely affect public health, harm fish and other aquatic life, and prevent or retard water quality improvements even when the best available pollution controls are installed on other point sources.²⁷

EPA's Nationwide Urban Runoff Program (NURP) is the primary evidence of the ubiquitous nature and significant quantities of pollutants in urban runoff:

Data collected under the NURP indicated that on an annual loading basis, suspended solids in discharges from separate storm sewers . . . are around an order of magnitude greater than solids in discharges from municipal secondary sewage treatment plants.²⁸

Chemical oxygen demand, fecal coliform, and oil and grease in urban runoff are also significant. EPA describes urban runoff as "an extremely important source of oil pollution to receiving waters. . . ." ²⁹ Construction runoff is also a massive problem:

Intensive construction activities may result in severe localized impacts on water quality because of high unit loads of pollutants, primarily sediments. . . . Sediment loadings rates from construction sites are typically 10 to 20 times that of agricultural lands, with runoff rates as high as 100 times that of agricultural lands, and typically 1,000 to 2,000 times that of forest lands. *Even a small amount of construction may have a significant negative impact on water quality in localized areas.*³⁰

Stormwater also contains toxic chemicals: 77 of 120 toxic priority pollutants monitored were found in storm water from residential, commercial, and light industrial lands.³¹ Of these toxics, 24 were found in over 10 percent of all samples taken.³²

The NURP authors described the water quality impacts of urban runoff as falling into three categories:

- short-term receiving water impacts during or following storm events (where pollutant concentration is important);
- longer-term downstream receiving water effects—the buildup of contaminants in the sediments of "sinks" like river mouths, lakes, and bays (where seasonal or annual pollutant mass loads are important). (Although NURP did not examine in detail this phenomenon, NURP data enable coarse estimates to be made of runoff annual mass loadings from large urban areas.)
- physical effects of storm flows on the hydrology and geomorphology of urbanized watersheds—including stream channel scouring.³³

The flow of storm water itself damages streams, and is a major source of degradation of water bodies in urban areas. The severe physical habitat effects that can result from storm water discharges can include streambank erosion and rapid changes in stream channel morphology, loss of protective riparian trees and other vegetative cover, and the loss of pool and riffle structures. All of these changes, caused by high volume and velocity stormflows that occur with great frequency after the construction of impervious surfaces such as parking lots, destroy the habitat necessary to support fish and other aquatic life.

More recent information confirms the severe continuing impacts of polluted stormwater urban runoff. Studies conducted by NRDC in U.S. cities have shown that the contribution of urban runoff to total annual pollutant loadings to urban streams and estuaries rivals, and in some cases surpasses, loadings of the same pollutants from factories and sewage plants.³⁴ Using national average runoff pollutant concentration data derived from the NURP study, NRDC made coarse estimates of runoff pollutant loadings for heavy metals, oil and grease, BOD, nitrogen, and phosphorus for seven urban areas around the country: Baltimore, MD; Washington, D.C.; Harrisburg, PA; Tidewater, VA; Los Angeles, CA; Atlanta, GA; and Cleveland, OH. Although the results varied from city to city, these "Poison Runoff Indexes" showed that runoff rivals, and in some cases surpasses, factories and sewage plants as a source of these pollutants. For instance, in most of the urban areas modeled by NRDC, zinc loadings from runoff exceeded the loadings from large factories in the State or region.³⁵

EPA, as well, confirms the continuing significance of stormwater pollution. Over 9800 impaired river miles, or 5.7% of total impaired miles, were polluted by construction runoff in the 1988-90 section 305(b) reporting cycle, and over 18,000 impaired river miles, or 10.6% of total impaired miles, were polluted by storm sewers from urban sites in the same cycle.³⁶ According to a 1992 EPA study of stormwater discharges, urbanization degrades a disproportionate share of our nation's waters:

While urban population areas take up only about 2.5% of the total land surface of the country, stormwater pollution from these urban areas and associated urban activities (i.e., storm sewers/urban runoff, combined sewers, hydromodification, land disposal, construction, urban growth, etc.) accounts for a proportionately high degree of water quality impairment (i.e., 18% of impaired river miles, 34% of impaired lake acres, and 62% of impaired estuary square miles

reported under 319) when compared to that from rural activities (i.e., agriculture, silviculture and mining) which take up approximately 53% of the total land surface.³⁷

2. THE STORMWATER PROGRAM HAS FACED CONTINUOUS DELAYS SINCE 1972

Despite these severe problems, it has taken EPA over twenty years, with constant prodding from environmental groups, Congress and the courts, even to begin to deal with stormwater. In 1973, EPA acknowledged that stormwater discharges fall within the Clean Water Act definition of "point source." However, EPA rules exempted many stormwater discharges from NPDES requirements, arguing there were simply too many outfalls to regulate.³⁸ NRDC successfully challenged EPA's authority to exempt these and other point sources from regulation.³⁹

NRDC's successful court challenge, however, was a classic case of winning the first battle in what would be a very long war. Over the course of the next decade, EPA issued and reissued stormwater control regulations, only to have them challenged in court, or withdrawn by the agency itself as administrations and policies changed. Separate proposed or final rulemaking notices were issued in 1979, 1980, 1982, 1984, and 1985.⁴⁰

In the 1987 Clean Water Act Amendments, Congress recognized the role of contaminated storm water runoff in the ongoing severity of the pollution of this nation's waters, and expressed impatience with EPA's slow progress:

... stormwater runoff from urban areas contains large volumes of toxic materials and other pollutants. Since 1972, municipal separate storm sewers have been subject to the point source permit requirements of the Clean Water Act. However, EPA only recently began to develop a permit program for these sources.⁴¹

To address this long history of delay, in 1987 Congress put EPA on a *new*, phased schedule for regulating storm water. EPA was first to regulate large cities (systems serving over 250,000 people) and industries, then medium municipalities (systems serving over 100,000 people), and finally small municipalities and other sources.⁴²

Congress extended these statutory deadlines reluctantly and only because EPA had failed to develop a viable storm water program. Senator Stafford stated, "... I generally do not support willingly any delays in environmental programs, especially a program to control a source of toxic pollutants as important as this one is. EPA should have developed this program long ago. Unfortunately, it did not."⁴³ Congress fully expected EPA to enforce the statutory deadlines in the 1987 Amendments. Senator Chafee stated, "... I expect EPA to move rapidly to implement this control program,"⁴⁴ and Senator Stafford said, "[t]he conferees believe that these new dates are responsible and reasonably can be achieved in virtually all cases."⁴⁵

Once again, however, EPA violated the law's deadlines for issuing stormwater regulations. The first phase of stormwater rules was issued nearly two years after the deadline (November 16, 1990), after a deadline suit was brought by an environmental group in Oregon. EPA again included major loopholes in its rules—for example, exemptions for a large number of industries and construction sites, which were once again rejected by a federal court after a legal challenge by NRDC. EPA still has not issued rules for small cities and other sources of stormwater;⁴⁶ last year, in an obscure, last-minute provision of the Water Resources Development Act which was subject to no public comment (much less debate), Congress provided an additional two-year extension for the remaining municipal areas.

This chronic history of delay in dealing with the severe problems caused by stormwater pollution outlined above are summarized in table 1.

TABLE 1.—DELAYS IN IMPLEMENTING THE URBAN STORMWATER PROGRAM

Date	Event
1972	Clean Water Act Requires Permits for All Point Sources (applications by 1973, permits by 1974)
1973	EPA Regulations Exempt Most Sources of Stormwater
1975	U.S. District Court Rules EPA Loopholes illegal
1977	U.S. Court of Appeals Upholds District Court
1980	EPA Issues Rules Responding to Court Decisions, but Exempts Cities Outside "Urbanized Areas"
1982	EPA issues "Nonenforcement Letter" informing Cities it would not Take Enforcement Actions Against Cities with Permit Applications

TABLE 1.—DELAYS IN IMPLEMENTING THE URBAN STORMWATER PROGRAM—Continued

Date	Event
1984	EPA Rule Further Extends Stormwater Permit Deadlines Until 1985
1985	EPA Rule Further Extends Stormwater Permit Deadlines Until 1987 and 1989
1987	Congress Modifies Program and Extends Stormwater Permit Until 1992, with Phased Permitting
1989	EPA Sued for Missing 1989 Deadline for Issuing Stormwater Rules
1990	EPA Issues Final Stormwater Rules Extending Compliance Deadlines Beyond Those in 1987 Law
1991	EPA Issues Revised Rules Further Extending Stormwater Compliance Deadlines
1992	EPA Issues Revised Rules Again Extending Stormwater Compliance Deadlines
1992	U.S. Court of Appeals Prohibits EPA from Further Extending Stormwater Deadlines
1992	Congress Provides Additional Extension of Stormwater Deadlines for Small Cities (in WRDA)
1993	S. 1114 Proposes to Exempt Most Cities Under 100,000 From Stormwater Permits Altogether

3. THE CURRENT MUNICIPAL STORMWATER PROGRAM IS FLAWED

Perhaps more important than the rulemaking delays were fundamental flaws in the rules issued by EPA in 1990:

(a) EPA narrowed significantly the scope of municipal separate storm sewer systems covered by the first rounds of permitting, leaving the vast majority of cities for later; and

(b) EPA failed to provide any significant guidance on the scope or substance of municipal stormwater programs, leaving on-the-ground controls entirely up to individual cities.

(a) Gaps in Coverage

Under EPA's implementation of 402(p), a total of 173 cities with populations of 100,000 or greater, and 47 counties with unincorporated populations of 100,000 or more, were required to have stormwater permits by October 1, 1992.⁴⁷ EPA excluded from coverage a total of 411 municipalities, each of which included populations over 100,000 according to the 1980 Census. Many of these are densely-populated suburbs of major metropolitan areas such as Atlanta, Chicago, Boston, Detroit, New York, Cleveland, and Philadelphia.⁴⁸ These areas suffer from some of the most severe stormwater pollution problems in the nation. (Even more cities would be excluded if 1990 Census data were used.)

EPA's judgment was affected by its concern over workload:

The need to establish a reasonable number of permits . . . during the initial phase of program development that will provide an adequate basis for a storm water quality program for over 13,000 municipalities after the October 1, 1992 general prohibition on storm water permits expires.⁴⁹

Congress was concerned about the number of municipal permits. But it expressly addressed this concern in two ways. First, in section 402(p)(3)(B)(i), it allowed municipal storm water permits to be issued on a "system- or jurisdiction-wide basis," rather than for every storm water outfall.⁵⁰ Second, Congress phased in municipal permitting requirements according to population.

EPA limited storm water permits to portions of counties in "urbanized areas," as defined by the Census Bureau. While density is one valid criterion to distinguish between the severity of stormwater problems, according to EPA's own data the Census Bureau's definition is inappropriate. The Census Bureau defines "urbanized areas" according to a complex definition which includes, as one factor, density of at least 1,000 persons per square mile.⁵¹ Whatever its reasons for selecting this criterion, the Census Bureau did not consider the appropriate density cutoff for weighing storm water runoff.

NURP, the most comprehensive study of urban storm water, indicates that a far lower density cutoff is appropriate. NURP indicates that a density of approximately one person per acre, or 640 persons per square mile, is the appropriate cutoff for storm water runoff concerns.⁵² Many of the nation's largest suburban areas were excluded from first-round permits under this reasoning.⁵³

Even more irrational was EPA's decision to *exclude* portions of counties covered by EPA's initial rule that consist of incorporated places with populations lower than

the statutory cutoffs. EPA even excluded whole counties that otherwise would meet the population cutoff and "urbanized area" requirements if most (all but 99,999 or fewer) of the residents lived in incorporated places with populations lower than 100,000.⁵⁴

These exceptions generated anomalous and illogical results:

(1) The rule covers a county with "urbanized" areas and a population of slightly more than 100,000, but without any incorporated places; but it would cover a county with urbanized areas and a population of one million, most of whom reside in a series of adjacent incorporated places each of which is smaller than 100,000. This scenario is typical of many suburban areas that are highly developed, but are comprised of a large number of incorporated places each of which is smaller than 100,000. This explains why such densely-populated suburban counties as Nassau County, Long Island; Cook County, IL; and San Mateo and Santa Clara Counties, CA are not included in EPA's rule. These areas include contiguous, densely-populated incorporated places each of which is below 100,000 people.

(2) The rules cover some parts of a county with a million people and "urbanized areas," but exclude from coverage some of the most densely-populated portions of those counties, i.e., those parts within incorporated places of less than 100,000 people.

Even EPA's own recent stormwater literature points out the need to expand the scope of regulation to additional urban areas:

"The 220 Phase I NPDES municipalities have a combined urban population of 78 million. The remaining 80 million people located in urbanized areas are outside of Phase I municipalities. Most urban growth occurs in the urban fringe areas outside of core cities. For example, between 1970 and 1980, the population of incorporated cities with a population of 100,000 or more (Phase I cities) increased by only 0.6 million, with the population of many of these cities decreasing. Between 1970 and 1980, the population of urbanized areas outside of cities with a population of 100,000 or more increased 30 times more (an increase of 18.9 million) than the population of these core cities. This is important from a stormwater perspective as numerous studies (e.g., NURP) have shown that *it is much more cost effective to develop measures to prevent or reduce pollutants in stormwater during new development than it is to correct these problems later on.*"⁵⁵

Thus, there are as many large urban areas currently outside of the NPDES stormwater permitting system as there are cities beneath the NPDES umbrella. This "regulatory gap," as the quote from EPA above makes clear, is all the more crucial considering that the areas left out of the NPDES umbrella are experiencing the most rapid growth rates, and thus have the most urgent need for immediate establishment of water-sensitive master plans and site design practices, before excavation and building ever begin.

(b) Absence of Substantive Requirements

Most of the municipalities that have now applied for their initial permits (Part I) have conducted stormwater pollution studies to develop city-wide stormwater management programs (Part II). However, because EPA has not provided substantive performance targets (such as the minimum urban area that must be covered by well-accepted stormwater management measures) for the permits, urban citizens and stormwater utility ratepayers may have little or no assurance of permit program accountability and effectiveness.

In section 402(p)(3)(B), Congress clearly intended to provide a new substantive standard for storm water control from municipal sources. But a *new* standard is far different from *no* standard. The Legislative History confirms that municipal storm water sources must be subject to defined minimum controls.⁵⁶

Congress cited the need for EPA to develop detailed substantive programs for municipal storm water control as the primary reason for the temporary exemption of storm water from NPDES permitting. In explaining the Conference provision on the Senate Floor, Senator Stafford explained why he reluctantly supported a delay in the municipal storm water program:

I would like to explain to my colleagues why a little more time is needed to develop a comprehensive municipal storm sewer program. These programs will not necessarily be like industrial discharge permits. Often, an end-of-pipe treatment technology is not appropriate for this type of discharge. As an EPA official explained during a meeting of the conferees:

These are not permits in the normal sense we expect them to be. These are actual programs. These are permits that go far beyond the normal permits we

would issue for an industry because they in effect are programs for stormwater management that we would be writing in these permits.

As my colleagues know, I generally do not support willingly any delays in environmental programs, especially a program to control a source of toxic pollutants as important as this one is. EPA should have developed this program long ago. Unfortunately it did not.⁵⁷

This same expectation is noted in the Conference Report itself:

. . . the conference substitute temporarily prohibits the Environmental Protection Agency and States from requiring permits for certain municipal separate storm sewers . . . in order to provide a sufficient period of time to develop and implement methods for managing and controlling discharges from municipal storm sewers.⁵⁸

Thus, Congress reluctantly accepted four years of delay largely to allow EPA sufficient time to develop a comprehensive new municipal storm water program. In its final regulation, however, EPA failed to provide any substantive, prescriptive requirements for municipal storm water management programs.⁵⁹ As a result, EPA's regulations are almost entirely vague, and there are virtually no hard criteria by which to judge the adequacy of municipal storm water permits and programs. Nor do municipal applicants have a clear target to shoot at when they prepare their permit applications.⁶⁰

Thus, rather than meeting its commitment to Congress to take advantage of the temporary reprieve granted by section 402(p) to develop comprehensive municipal storm water control programs, EPA punted its responsibility to municipalities around the country. These applications will be reviewed by individual NPDES permit-writers (who themselves will have no guidance in the regulations to decide which applications propose adequate programs), and will result in vastly different requirements, inconsistent water pollution control and potentially severe inequities in costs and water quality among communities.

NRDC agrees that storm water programs should reflect comprehensive regional programs of structural and nonstructural approaches. A single, rigid set of criteria and performance standards would be impractical and unwise. However, the need to provide for flexibility does not obviate the duty to provide a minimum set of performance standards that will realize Congress' goal of establishing programs that reduce storm water pollution to the maximum extent practicable.⁶¹

EPA's own statements underscore the need for municipal storm water permits to provide for sufficient uniformity in pollution reduction to achieve the goals of the Act. EPA's response to comments on its draft rule under 402(p) states:

EPA agrees that as much flexibility as possible should be incorporated into the program. *However, flexibility should not be built into the program to such an extent that all municipalities do not face essentially the same responsibilities and commitment for achieving the goals of the CWA.*⁶²

EPA's completely open-ended, non-substantive municipal storm water permit application requirements at best will result in haphazard, unpredictable, and unenforceable storm water pollution control programs, and at worst will result in a collection of "paper programs" with no ultimate reduction in storm water pollution.⁶³ Minimum standards for acceptable storm water control programs are feasible. This is strongly suggested by EPA's own finding that urban storm water discharges around the country are surprisingly similar.

NURP and other studies have verified that even mean concentration of pollutants in urban runoff from residential and commercial areas remains relatively constant from one area to another. . . .⁶⁴

NRDC suggested several options for such controls in comments on the proposed rule, drawing from the experience of state and local storm water programs around the country. Various kinds of performance standards for runoff pollutant reduction, and control of the stormflows themselves, are technically feasible and in many cases are in place at the State and local level around the country. Data on the pollutant reductions achievable by various Best Management Practices are available from well-known sources, including EPA's final NURP report, which included BMP performance data from studies of fourteen wet detention basins in six cities, and a 1987 urban runoff BMP manual from the Washington Metropolitan Council of Governments.⁶⁵ At least five states have storm water control and water quality laws that contain substantive storm water control requirements for various categories of urban land use and development.

There are several ways that flexibility in storm water programs can be maintained, while still providing substantive pollutant reduction standards for storm

water that will ensure that all permittees have essentially the same commitment to achieving the goals of the Act. Flexibility can be maintained, for example, by establishing separate performance standards for each of the climate regions in the United States designated by EPA,⁶⁶ to address variations in urban runoff characteristics linked to variations in precipitation patterns.

EPA can provide additional flexibility in its municipal storm water permitting guidelines by providing States and permit writers with a choice of several different types of performance standards for runoff control programs. There are at least four different categories of performance standards, and all have examples in current State and local programs:

- *Required Best Management Practices (BMPs)*, possibly a region-specific, mandatory menu of BMPs which each municipality must implement as a permit condition. Considerable information exists on the performance characteristics of various BMPs, on which EPA can base its choices for the list of required BMPs. Not all permittees have to choose the same BMPs, but they must choose an adequate number from EPA's menu. An example of a BMP requirement is the District of Columbia's rule mandating installation of an oil and grease treatment device for "storm water discharge facilities." Examples of mandatory BMP programs are also provided by State and local erosion and sediment control laws around the country.
- *Pollutant reduction performance standards*, which establish minimum pollutant reduction levels as a percent of annual baseline raw runoff loadings, based on analyses of the engineering and municipal program literature. Maryland's Critical Areas Act contains a pollutant reduction performance standard for redevelopment and new development in the regions within the State's Critical Area that are designated "Intensely Developed Areas." The runoff performance standard requires that these developments install runoff controls that will achieve a post-development pollutant loading that is ten percent below the pre-development loading from the site.⁶⁷ The Maryland Critical Areas Act also Provides EPA with methods for applying the "keystone pollutant" concept, and baseline loading estimates, both of which are useful in applying runoff pollutant reduction performance standards.
- *Service area performance standards*, which establish a minimum percentage of a permittee's total area, or total impervious area, to be serviced by pollutant reduction BMPs. EPA could determine the total percentage of watershed drainage area that must be served by retrofit BMPs in the watershed, as well as by BMPs installed concurrently with new developments, and use these figures to set "minimum area served" performance standards for urban runoff controls.
- *Flow/Hydrological performance standards*, which may establish retention requirements in several different ways: minimum design storm capture, downstream peak discharge control, or minimum runoff flow capture. State policies have been aimed at achieving pollutant reduction, and at maintaining or approximating the natural flow regimes of the receiving streams.

Florida requires storm water permit applicants for areas of 100 acres or less to provide for the retention, or detention with filtration, of the first one-half inch of runoff, or of the first one inch of rainfall, whichever is greater. For areas greater than 100 acres, the performance standard consists of mandatory treatment of runoff from the first one-inch of rainfall.⁶⁸

No single one of these proposals is necessarily the only correct approach. But EPA had ample options from which to choose, and had no excuse for choosing none.

The concept of "pollution prevention," a congressional mandate under the Pollution Prevention Act of 1990, provides a particularly attractive approach for establishing meaningful but flexible requirements for the Clean Water Act stormwater program, through the following runoff prevention and reduction hierarchy:

- 1) for new development: runoff prevention through mapping and preservation of natural drainage ways, preservation of mature forest zones along waterways, and caps on the amount impervious surface;⁶⁹
- 2) for redevelopment and retrofitting of existing developed areas: runoff reduction through revegetation, impervious surface reclamation (e.g. retrofitting parking lots with grass swales designed to capture and filter the lot's runoff, thus preventing or severely reducing the need to discharge to a nearby stream);
- 3) chemical source controls and toxics use reduction (e.g. policies that require lawn service companies to test lawns for nutrient content and pest problems before applying chemicals, in order to reduce lawn chemical use); and
- 4) conventional "end-of-pipe" stormwater treatment devices, such as extended detention ponds, infiltration trenches, and catch basins.

This "stormwater policy hierarchy" in turn could be incorporated into a comprehensive watershed restoration program that highlights the importance of urban waters to inner-city dwellers, relies on local citizen groups and municipalities to initiate and structure long-term restoration strategies (that may include community-based studies like surveys of urban fishing patterns, and locally-based skilled jobs like urban forestry), and channels federal dollars to priority urban watersheds to help fund the restoration work.⁷⁰ Such a program would help to focus the energies of urban activists into the work of "re-greening the urban landscape," enshrining this ecological goal as a critical part of the Clean Water Act's goal of "fishable, swimmable", waters for all Americans.

4. SECTION 402 OF S. 1114 EXACERBATES RATHER THAN SOLVES PROBLEMS WITH THE STORMWATER PROGRAM

While S. 1114 attempts to resolve many of the problems with the current municipal stormwater program, it fails to do so effectively in some cases, and takes us dramatically in the wrong direction in others. In particular, the bill:

- 1) *relies on the CZARA urban runoff measures in defining Maximum Extent Practicable, which means that the current "write-your-own" permit approach will be largely continued;*
- 2) *exempts cities and urban/suburban counties under 100,000 population that are not within a much larger jurisdiction; and*
- 3) *exempts even the permitted municipalities from either numeric limits, or compliance with water quality standards, for the first two permit terms, meaning that the permits will remain largely unaccountable to larger ecosystem restoration goals, including the most fundamental goals of the Clean Water Act.*

Below, we explain these problems in more detail, and provide specific proposed amendments to fix them.

PROBLEM #1: Reliance on the CZARA urban runoff measures in defining Maximum Extent Practicable means that the current "write-your-own" permit approach will be largely continued; little will be provided in the way of a specific, national "technology floor" for urban stormwater permits.

"CZARA" stands for the Coastal Zone Act Reauthorization Amendments of 1990. This new program is a blend of two programs that have focused on land-based sources of water pollution: Clean Water Act Section 319, and the Coastal Zone Management Act. CZARA required EPA to work with the National Oceanic and Atmospheric Administration to come up with guidance to the States in regulating polluted runoff from land uses known to degrade coastal waters. One of the results of this new mandate is a thick technical tome published by EPA on runoff "management measures," known as the "Blue Book," this guidance contains management measures for agriculture, urban developments, and other land uses.

Although the concepts embodied in the management measures are sound, they are often too weak because they are too vague, general, and lacking in performance standards to guide their implementation by both States and landowners. The management measures are usually followed by laundry lists of site-level practices. These practices are the nitty-gritty, on-the-ground actions that landowners need to take to protect water quality. But because the actual practices are voluntary, ensuring that the management measures get implemented, and backing them up with enforcement procedures, will be a Herculean and thankless task for many State water quality agencies.

The CZARA technical guidance has five categories of management measures that specifically relate to controlling runoff from urban areas: New Development; Construction; Existing Development; Onsite Disposal (septic) Systems; and Roads, Highways and Bridges. We discuss the New Development and Existing Development measures in detail below. The onsite disposal measures contain some objective performance standards; neither the "Construction Activities," nor the "Road, Highway and Bridges" measures contain objective standards.

The Existing Development Management Measure requires that "watershed management programs" be developed to reduce runoff in four ways:

- 1) "identify priority local and/or regional watershed pollutant reduction opportunities, e.g. improvements to existing urban runoff control structures;"
- 2) "contain a schedule for implementing appropriate controls;"
- 3) "limit destruction of natural conveyance systems;" and
- 4) "where appropriate, preserve, enhance, or establish buffers along surface waterbodies and their tributaries."

Each of these items are important elements of any stormwater management program, and should be included in NPDES permits. However, in and of themselves,

they contain no objective means of determining effectiveness in reducing existing runoff loadings. No quantitative performance standard determines the scope of their application in each permitted jurisdiction. For instance, while the exhortation to "limit destruction of natural conveyance systems" is laudable, the degree to which it should be applied by each permittee is unspecified.

Similarly, element #1, "identify . . . improvements to existing . . . control structures" is extremely vague, and lacks a means to verify whether each permittee has satisfied its intent. If the intent is to require each urban area to install a minimal number of detention ponds, infiltration trenches, constructed wetlands, or other "retrofit" devices, then the measure should have specified a quantitative minimum for these devices. For instance, the measure could have specified that "improvements be made to a minimum of 50% of the permittee's existing stormwater control structures." Instead, a permittee could conceivably have a permit under this proposal that reads "retrofit [a few] [several] [five to ten] stormwater devices per year," in an area that has a thousand devices awaiting a retrofit.

Without some form of quantitative or otherwise objectively verifiable performance standard attached to the management measures, it is difficult if not impossible for the permitting authority, or citizen water watchers to ascertain whether Congress' intent, and the letter of the law, is being met.

The Pollution Prevention Management Measure requires that "prevention and education" programs be developed to address the following urban runoff sources:

- 1) household hazardous chemicals;
- 2) lawn and garden activities;
- 3) turf management on golf courses, parks, and recreational areas;
- 4) discharges into storm drains;
- 5) commercial activities including parking lots and gas stations; and
- 6) improper disposal of pet excrement.

While these are important source categories for urban runoff, no specific activities ("practices") are required. Thus, if a local government sends a "pesticide use reduction education" brochure to golf courses in its jurisdiction, does that satisfy the golf course portion of the management measure? If so, there is no guarantee that actual water-sensitive practices will be installed on any golf course in this example, only that some kind of education take place. While education is an important part of runoff reduction programs, it must be accompanied by specific kinds of runoff reduction practices in order to be effective.

CZARA Measures Pertaining to New Development

Virtually everyone in the stormwater management field agrees that an ounce of prevention is worth a pound of cure—that it makes sense to require stormwater management site designing as part of the suburban/urban development zoning and planning process.

There are three measures related to new development in the urban chapter of EPA's CZARA Technical Guidance. These are: 1) "New Development"—which contains a single numeric standard, namely, an 80% reduction in total suspended solids loadings on an annual basis is required for the post-construction phase for new developments; 2) "Watershed Protection"—which contains no objective standards for implementation; and 3) "Site Design"—which contains no objective standards for implementation.

As NRDC commented to EPA on the draft version of this guidance last summer, these measures are conceptually correct, but they have the effect of promoting an end-of-pipe, rather than a prevention mentality for stormwater. By requiring a numeric standard only for total suspended solids, EPA is, in effect, pushing developers to install stormwater "physical devices" like detention ponds and infiltration trenches, which constitute "end-of-pipe" treatment devices.

By including the good concepts of watershed protection and site design, but requiring no objective, verifiable performance standard to back them up, EPA is virtually guaranteeing that business as usual will continue unabated and unchallenged.

NRDC's study of two counties that have had new development stormwater management requirements implemented since the mid-1980s demonstrates the futility of the kind of end-of-pipe controls that the EPA CZARA measures will (inadvertently) promote.⁷¹ In this study, of Prince George's and Montgomery Counties, Maryland, we found, for example, that estimated phosphorus loadings from the two counties had increased by 20% by 1990 above the level of 1985—despite the fact that end-of-pipe stormwater treatment devices were assumed to have been installed, and working up to literature performance levels—in all new developments.

The implication of this stormwater management study is clear: without planning-level controls that include progressive transportation planning to reduce the

amount of new imperviousness and the number of vehicle-miles, and natural drainage way preservation and other "design with nature" approaches—"stormwater mitigation" devices will not serve to adequately protect waters of the U.S. from the effects of suburban sprawl.

Furthermore, NRDC and others have shown that simple "new development stormwater requirements" are not enough—legislation must provide some specifics to the effect that imperviousness shall be minimized (with numeric caps, at least on a watershed basis) . . . and that natural drainage ways shall be preserved as part of the stormwater management planning and design. The research by NRDC cited above suggests that suburban sprawl, even when it incorporates stormwater management devices, creates significant additional nutrient loadings that can overwhelm, or cancel out, any gains made by controls on other sources, for instance, tertiary sewage treatment.

Remedy: Amend S. 1114 proposal to specify a short list of universally-applicable urban management measures, to include the following, and require EPA to establish quantitative or otherwise verifiable criteria for their implementation, for inclusion in all municipal stormwater permits:

- 1) parking lot retrofits to capture, attenuate, and/or filter runoff;
- 2) new development controls specifying numeric caps on imperviousness and numeric floors on vegetation preservation, and that preserve all natural drainage ways;
- 3) public education with target populations, frequency of outreach, and other specifics required;
- 4) minimum percentage of existing flood-control devices within each permittee's jurisdiction to be retrofitted for stormwater quality benefits;
- 5) chemical source controls including gas station measures and practices;
- 6) mandatory planning coordination between stormwater managers and transportation and land use planners;
- 7) illicit discharge program with an objectively verifiable conveyance system surveying and discharge elimination protocol (e.g. require use of dry weather sampling at a minimum number of outfalls, require CCTV use in a minimum percentage of conveyance pipelines etc.);
- 8) other measures, including region-specific measures as deemed appropriate.

There are many standard urban runoff manuals available that demonstrate the feasibility of standard management measures nationwide, for mitigating and abating runoff from existing development. These include: the 1992 *Stormwater Management Manual for the Puget Sound Basin*, published by the Washington State Department of Ecology; the Minnesota Pollution Control Agency's 1989 Best Management Practice Manual entitled *Protecting Water Quality in Urban Areas*; and the 1993 *California Storm Water Best Management Practice Handbooks*, published by the California Storm Water Quality Task Force.

PROBLEM #2: Exemptions for smaller cities and urban/suburban counties under 100,000 population that are not within a much larger jurisdiction. This provision targets the "pocket" or "enclave" municipalities (those within larger urban cities or counties) for inclusion in permits, while leaving all others unregulated, including many of our largest, most rapidly growing suburbs.

According to a report from EPA on the environmental impacts of stormwater discharges:

. . . it is much more cost effective and institutionally feasible to develop controls for new development than it is to retrofit old development.⁷²

Furthermore, the same report states that:

Urban fringe areas are experiencing the largest land use changes due to rapid growth in population resulting in an excessive net increase in pollution loadings. Many of these fringe areas are not currently covered under the Phase I NPDES stormwater program.⁷³

EPA's current policy of exempting the "urban fringe areas," including many of the counties and cities undergoing the most rapid growth in the country, from the stormwater permitting regulations, is left largely unchanged by the Baucus-Chafee bill. To further quote from the EPA report cited above,

Under Phase I [the issuance of permits to the large and medium municipalities], EPA defined municipal separate storm sewer systems on the basis of political boundaries, including 173 incorporated cities (having a population of 100,000 or more) and 47 of 500 counties having an unincorporated population of 100,000 or more. The counties that were addressed by the 11/16/90 regulation were in a handful of States, primarily MD, VA, FL, and CA. *While the current regulations*

indirectly address suburban growth in these States, in most parts of the country, the regulations only address core cities and exclude suburban or "urban fringe" development." (Emphasis in original.)⁷⁴

By exempting many small cities, as well as rapidly-growing counties, from stormwater permits, the Baucus-Chafee bill misses the best opportunity to implement pollution prevention measures now—so that we can avoid much higher retrofit/mitigation costs later.

In addition, the wholesale exemption of smaller, stand-alone urban areas means that existing stormwater problems will not be corrected. The Nationwide Urban Runoff Program (a joint study of 28 urban areas conducted in the early 1980s by EPA and USGS) data shows that site-to-site variability in runoff quality is highly difficult to predict. To quote from the NURP conclusions:

As a result of extensive examination, it was concluded that *geographic location, land use category . . . or other factors . . . appear to be of little utility in consistently explaining overall site-to-site variability in urban runoff . . .*" (emphasis added).⁷⁵

This conclusion means that, as a general rule, the quality of runoff—its relative degree of contamination—was not found to vary in any discernible pattern from location to location. Thus, it is not possible to conclude, from currently-available, comprehensive studies, that small cities' runoff quality is different from large cities' runoff.

The Baucus-Chafee "small municipality" provision has the benefit of including the "urban enclaves" within pre-existing permits—for instance, those incorporated cities and towns within counties already captured by the "large or medium" (100,000 and above population) permitting category. Since urbanization patterns vary around the country, in some regions the Baucus-Chafee "small city" policy may capture most of the key urban areas in the region. In other regions, this will not be the case, and *the Baucus-Chafee proposal will have the effect of leaving the polluted runoff of significant urban areas unregulated. As one stormwater policy expert has observed:*

The patterns and functions of local governments in suburban fringe areas vary from State to State. In some States, such as MD, VA, FL and CA, and, to a lesser degree, a number of southern States and TX, large urban populations outside of core cities are in unincorporated portions of counties. In these cases, the county government conducts the major functions of local government. However, in most States, including New England, Mid-Atlantic, Great Lake, Mid-western, and most Western States, the primary form of local government for many municipal functions is not a county but either an incorporated place or a minor civil division.⁷⁶

This observation points to the need to expand the scope of permitted municipalities far beyond the urban "enclaves" that exist in a few states. In the many regions listed in the quote above that do not follow the "County-dominated" urbanization pattern, the mere capture of small municipalities only when they are in urbanized areas within already-permitted (large and medium) municipalities, will exempt significant sources of urban polluted runoff, including already-developed urban areas and rapidly-growing urban areas.

THE REMEDY: Delete the exemption for urban areas of less than 100,000 people outside currently-permitted areas, and provide less drastic relief through authority for general permits or county-wide permits.

We recognize the administrative burdens that stormwater permitting imposes on federal and state permit-writers, and the cost of stormwater permitting for smaller cities who lack the same access to financial and technical resources as larger cities. The answer to this problem, however, is not simply to "write off" water quality in urban areas. Instead, it is to find more efficient ways to bring smaller cities into the stormwater program in a cost-effective manner. Two options could be explored as a more rational and cost-effective approach to stormwater permits for smaller cities in ways that give appropriate attention to serious environmental problems caused by polluted urban runoff:

(1) EPA or states could be authorized to develop a general permit for smaller cities, perhaps with variations by hydrologic region, rather than requiring smaller jurisdictions to submit individual stormwater permits. Such general permits can draw on the extensive information submitted by larger municipalities, on a region-specific basis, as part of existing stormwater programs.

(2) Cities under 100,000 could be included within a single, areawide stormwater permit for the next largest governmental size (county, borough, township, parish,

etc.), as appropriate to the political structure in individual states). This would allow smaller cities to take advantage of appropriate economies of scale, and would reduce substantially the permitting burden on EPA and state officials.

PROBLEM #3: Exempting permitted municipalities from either numeric limits, or compliance with water quality standards, for the first two permit terms.

Especially given the absence of any objective, verifiable technology-based floor for stormwater controls, exempting stormwater permits from numeric permit standards and compliance with water quality standards leaves the program with no accountability whatsoever. This proposal casually tosses away one of the most fundamental principles in the Clean Water Act—compliance with the water quality standards designed to assure waters that are fishable and swimmable—and leaves nothing in its place. This suggestion will be met with serious objections from water quality activists around the country who rely on water quality standards and enforceable numeric permit limits as the most basic Clean Water Act tools and objectives.

A limited-term, explicit exemption from meeting water quality standards in municipal stormwater permits should not even be considered unless it will be replaced with an explicit, acceptable list of applicable management measures, along with other stringent permit-writing guidance to help ensure that a national "technology floor" is established for the permits. While even this would constitute a significant weakening of existing law, at least it would trade one enforceable current set of requirements with another that is less burdensome on permittees and permit-writers, but potentially more effective in resolving the real-world problems caused by urban stormwater runoff.

REMEDY: There are two potential options to fix this problem: 1) eliminate this provision entirely from the bill; leave numeric limits and WQS compliance to drive better, more ambitious urban stormwater programs; or, 2) specify that, while numeric effluent limits are not required at this time, minimum technology-based performance standards discussed above must be employed, and municipal permits shall be designed to reach water quality standards compliance in the receiving waters in the second and all subsequent permit terms.

B. Combined Sewer Overflows

Combined sewer overflows (CSOs) are discharges of raw (untreated) human sewage mixed with stormwater runoff, and often with industrial wastes, which occur during storms because older sewer pipes carrying both stormwater and raw sewage become overloaded. During overflows the foul mixture is diverted from the sewage treatment plant at overflow points and is discharged directly into our rivers, lakes and coastal waters.

The CSO problem is a big one. EPA estimates that over 1,100 collection systems in the United States, "serving" approximately 40 million people, have combined sewer systems.⁷⁷ Of those, 328 systems serving about 25 million people had documented needs for wastewater treatment control as of 1988.⁷⁸ The documented price tag to fix these problems totaled \$16.4 billion in 1988 dollars.⁷⁹ Over half of these CSO needs are located in marine and estuarine systems which "serve" approximately 12 million people.⁸⁰ Thus, while the number of systems around the country which have CSOs is relatively small in comparison to the total number of sewage treatment systems (approximately 1100 out of over 24,000 collection and treatment systems),⁸¹ the affected systems serve nearly 16% of the nation's population.⁸²

A number of large U.S. cities have significant CSO problems. A 1992 NRDC study showed that over 165 billion gallons of raw sewage mixed with polluted stormwater and industrial discharges are discharged into surface' waters by 14 large cities with combined sewer systems:

ESTIMATED ANNUAL COMBINED SEWER OVERFLOW RELEASES FROM 14 U.S. CITIES

City	Gallons	Sediments	Organic wastes (pounds)	Copper	Lead	Zinc
Atlanta	5.3 bil	1.5 mil	5.5 mil	4,500	15,000	15,000
Boston	5.2	9.4	4.3	3,900	7,900	11,000
Bridgeport	1.7	1.1	0.4	1,500	4,900	5,000
Chicago	27.0	10.0	6.9	21,000	4,400	144,000
Cleveland	5.9	26.0	4.7	6,700	9,200	12,000

ESTIMATED ANNUAL COMBINED SEWER OVERFLOW RELEASES FROM 14 U.S. CITIES—Continued

SOURCE: NRDC, "When It Rains It Pollutes" (April 1992).

The quantity and range of pollutants discharged by CSOs are significant. While precise figures are not available due to a shortage of monitoring data, the following estimates can be made:

- Total suspended solids in CSO discharges can range from roughly 400 to 700 milligrams per liter—which is roughly two to three times the suspended solids concentration of "normal" raw sewage.⁸³
- Biological Oxygen Demand (a measure of the organic material in water that can rob aquatic life of oxygen) ranges in concentration in CSOs from roughly 80 milligrams per liter to 150 milligrams per liter.⁸⁴ (In comparison, the effluent from a sewage treatment plant is required to meet a 30 day average discharge standard of 30 milligrams per liter.⁸⁵)
- Fecal coliform counts in CSO discharges can range from 200,000 to over 1,000,000 per 100 milliliters.⁸⁶ (In comparison, many States recommend that bathing be restricted at beaches where fecal coliforms exceed 200 per 100 milliliters.⁸⁷)

Very little information is available on the toxic pollutants discharged by CSOs. However, since twelve percent of the total flow to sewage treatment plants nationwide consists of industrial wastewater,⁸⁸ industrial toxics are likely to be present in significant quantities in CSO discharges; industrial flow to these systems receives no treatment at the POTW during overflow events. And as discussed above, urban stormwater runoff, which makes up the bulk of total volumes of CSO discharges, also contains numerous toxic pollutants including heavy metals, oil and grease and organic chemicals.

While major progress has been made in the past decade in achieving a minimum level of secondary treatment for municipal POTW discharges, the CSO control program has lagged far behind. One principal reason is that, while CSOs have been eligible for some portion of construction grant financing, relatively few of these Federal funds actually have been available for CSO abatement. The magnitude of CSOs' contribution to water quality problems also may have been obscured to some degree by sewage treatment plant discharges 'until the secondary treatment program was well on its way.

Either because EPA did not wish to press the States to take action on CSOs when the agency lacked a major federal grants program to assist them, or because it had other priorities, until recently EPA did very little on a national level to bring CSO discharges under control. Although EPA maintains that CSOs are subject to BAT standards, EPA did not draft a national categorical standard for CSO discharges but instead has left State or Regional permit writers no alternative but to rely upon their best professional judgment (BPJ) for CSO permitting.

In August of 1989, EPA did publish a National Combined Sewer Overflow Control Strategy. The Strategy called upon all States (or EPA where it is the permit-issuing authority) to develop and submit to the agency, by January 15, 1990, a statewide permitting strategy for CSO controls. The permitting strategy requires that the responsible entity do the following:

1. Identify communities with CSOs, including each CSO point, and determine whether the CSOs are subject to permits and, if so, whether they are in compliance with applicable standards;
2. Set priorities for achieving compliance, and describe how compliance will be achieved (including descriptions of the nature of control measures to be applied);
3. Issue permits (where possible, on a system-wide basis rather than for individual outfalls) for each CSO system. Permits are to include monitoring requirements and permit reopener clauses based on results of the testing; and
4. Establish compliance schedules in those instances where statutory deadlines cannot be met, using administrative enforcement orders or other legal enforcement tools.

The CSO Strategy gave extremely limited guidance as to what constitutes BAT, the minimum level of technology required under EPA's interpretation of the law: proper operations and maintenance; maximum use of the sewer collection system for storage; pretreatment program revisions to minimize CSO impacts; maximization of the POTW's capacity to accept storm flows; prohibitions on dry weather overflows; and control of solids and floatables. The Strategy also notes that, where water quality standards are not met, additional controls must be placed on discharges. But it still leaves it to individual permit-writers to decide what will actually be required to control each CSO permittee.

According to EPA, 30 strategies had been received from the States and Regions as of July 20, 1992, all of which have been approved; another 5 states have combined sewers, but claim they need no strategy.⁸⁹ Meanwhile, recognizing the inadequacy of the existing permitting strategy, EPA committed to issuance of a revised, hopefully stricter policy.

During the summer and fall of 1992 EPA convened a policy dialogue in which representatives of cities, states and environmental groups attempted to reach consensus on a new CSO permitting strategy. While the parties did not reach full consensus on this strategy, a joint framework for a new strategy ultimately was presented to EPA: Building on this framework, in late December EPA released for public comment a new Draft CSO permitting strategy.⁹⁰ In this proposal EPA added the following to the six earlier minimum controls: pollution prevention (including water conservation), public notice of waters affected by CSO discharges, and adequate monitoring. In a major step forward, however, the new strategy proposes a menu of minimum technology-based controls from which cities may choose.⁹¹ In addition, the proposal would require relocation or elimination of releases to sensitive waters wherever feasible.

NRDC strongly supports the incorporation by reference of this compromise CSO strategy in S. 1114 (although the Committee should incorporate into its final bill the more comprehensive beach protection elements of S. 997 as well).

CONCLUSION

We appreciate this opportunity to testify on the funding and other municipal aspects of Clean Water Act Reauthorization. We look forward to working with the Committee on these and other issues as these hearings proceed, and during Committee and Subcommittee markup. I would be happy to answer any questions at this time.

ENDNOTES

41. 1987 Legislative History, 1304, 617.
42. In section 405 of the 1987 WQA (adding section 402(p) to the CWA), Congress established explicit and firm deadlines for EPA regulation of storm water discharges. Section 402(p)(1) of the Act provides that EPA cannot require a permit for certain storm water discharges until October 1, 1992, with five exemptions (discharges that are required to obtain a NPDES permit prior to October 1, 1992): (A) A discharge with respect to which a permit has been issued prior to February 4, 1987; (B) A discharge associated with industrial activity; (C) A discharge from a municipal

separate storm system serving a population of 250,000 or more; (D) A discharge from a municipal separate storm sewer system serving a population of 100,000 or more, but less than 250,000; or (E) A discharge for which the Administrator or the State determines that the storm water discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to the waters of the United States. The statute makes clear that all storm water discharges associated with industrial activities remain subject to all requirements of sections 301 and 402 of the Act, but subjected discharges from municipal storm sewers to new requirements. CWA, § 402(p)(3)(B).

43. 1987 Legislative History at 618, see also pp. 368, 391, 392,

44. 1987 Legislative History at 368.

45. *Id.* at 632. Furthermore, Senator Stafford stated, "(t)hese (municipal and industrial permit application deadline) dates are outside dates." *Id.* at 618.

46. In late 1992 Congress once again granted EPA and these stormwater sources a reprieve, giving EPA until October 1, 1993 to issue regulations, and the sources until October 1, 1994 to submit permit applications.

47. 40 C.F.R. Part 122, and Appendixes F-I. EPA defined large and medium municipal separate storm sewer systems to include only two types of municipal entity: (1) "incorporated place(s)" with populations greater than 250,000 and 100,000, respectively, as determined by the "latest Decennial (1980) Census" (listed in Appendixes F and G to the rule); and (2) counties listed in Appendixes H and I to the rule, *excluding* "municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties," (regardless of whether those incorporated places are covered under (1)).

48. Excluded areas include: Fairfield County, CT (population *excluding* incorporated places 579,000); Fulton County, GA (201,000 *excluding* Atlanta); Cook, Lake and Will Counties, IL (Chicago suburbs—over 2 million people *excluded*); Suffolk, Middlesex, Essex and Norfolk Counties, MA (Boston suburbs—2.6 million *excluded*); Macomb, Oakland and Wayne Counties, MI (Detroit suburbs—2.5 million *excluded*); Bergen, Essex, Union and Hudson Counties, NJ, and Westchester and Nassau Counties, NY (closest New York suburbs—over 4 million *excluded*); Cuyahoga, Lorain and Lake Counties, OH (Cleveland suburbs—1.4 million *excluded*); Montgomery and Delaware Counties, PA and Camden, Gloucester and Burlington Counties, NJ (Philadelphia suburbs—2.3 million *excluded*). Of 1.4 million people in Santa Clara County, California, only 825,000 live in the two incorporated places that have more than 100,000 people (San Jose and Sunnyvale). *None* of the people in adjacent San Mateo County (population 613,500) live in incorporated places. The result: under EPA's formulation, over 1.2 million people in the densely populated San Francisco suburbs of San Mateo and Santa Clara counties are not covered by the rule. Thus, the megalopolis of urbanized areas from South San Francisco to Pacifica, San Bruno, Burlingame, San Mateo, San Carlos, Redwood City, Menlo Park, Palo Alto and Mountain View are outside the purview of the rule.

49. 55 Fed. Reg. at 48039, col. 1.

50. As explained by Rep. Rowland, who was responsible for the municipal stormwater amendment in the House, this reduced the number of necessary permits from the "millions" to the "thousands." 1987 Log. Hist. at 351-52, 672. Including all municipalities as defined by the 1987 law would raise the total covered by the rule from 219 to only 641.

51. See 55 Fed. Reg. at 48041, n. 5.

52. NURP Final Report, see, e.g., Tables 6-1 E.R. at 6. NRDC brought this and other information to EPA's attention in NRDC's comments on the proposed rule. NRDC comments (March 7, 1989), pp. 13-14 & n.25.

53. Just some examples of whole counties that would meet the 640 persons/square mile test indicated as appropriate under the EPA NURP study but that are not "urbanized areas" according to the Census Bureau include San Mateo County, CA (population 613,500); Santa Clara County, CA (over 1.4 million); Fairfield County, CT (821,000); Hartford County, CT (825,200); New Haven County, CT (779,000); Duval County, FL (646,000); Seminole County, FL (240,100); Fulton County, GA (622,700); Cook, Dupage and Lake Counties, IL (over 6 million); Lake County, IN (492,000); Jefferson County, KY (681,000); Middlesex County, MA (1.3 million); Oakland County, MI (over 1 million); Hennepin County, MN (988,000); St. Louis County, MO (993,000); Bergen County, NJ (837,000); Nassau County, NY (1.3 million); Cuyahoga County, OH (1.4 million); and Montgomery County, PA (672,000).

54. 40 C.F.R. §§ 122.26(b)(4)(ii) and (7)(ii).

55. EPA, *Environmental Impacts of Stormwater Discharges*, 11 (emphasis added).

56. 1987 Legislative History at 368 and 632 (Sen. Chafee), 391, 646 (Sen. Durenberger), 559 (Rep. Roe), 847 (Conf. Rept.).

58. 1987 Legislative History at 846 (emphasis added).

59. The requirements for municipal storm water management plans are set forth at 40 CFR § 122.26(d)(2)(iv). The provision begins by parroting the statutory language of section 402(p)(3)(B), and then lists a series of purportedly more detailed requirements. However, none of these requirements establishes minimum criteria or performance standards. While applicants are instructed to describe structural and source control methods to reduce pollutants from storm water, and to estimate the annual pollutant load reductions from their proposed management program, *nowhere are they required to achieve any specified level of reduction of any pollutants via their storm water permits and programs.* 40 CFR § 122.26(d)(2)(iv)(A). Municipalities are required to describe a series of control measures that can be included in each such program, 40 CFR § 122.26(d)(2)(iv)(a) (1)-(6), but *virtually none of these are mandatory, and no minimum requirements or performance standards attach to these "descriptions"*. The remaining requirements for management programs are equally vague. 40 CFR § 122.26(d)(2)(iv)(C) requires a description of a program to control runoff from solid and hazardous waste disposal facilities and industrial sites, but imposes no mandatory or minimum control measures or performance stand-

ards. 40 CFR § 122.26(d)(2)(iv)(D) requires a *description* of a program to control runoff from construction sites, but again includes absolutely no minimum control requirements or performance standards. As stated in the final rule preamble, the Part 2 permit application does nothing more than provide "municipalities with the *opportunity* of proposing a comprehensive program" of storm water controls." 55 Fed. Reg. at 48045, col. 2-3. See also *id.* at 48052, col. 1-2.

60. In comments on the proposed rule, some municipalities expressed frustration with this lack of guidance. See 55 Fed. Reg. at 48054, col. 1.

61. The Conference Report states that "controls may be different in different permits. All the types of controls listed in subsection (o)(2)(C) are not required to be incorporated into each permit." 1987 Leg. Hist. at 847. As shown below, however, the fact that each permit need not be identical and select every item from EPA's menu of standards does not mean that EPA's menu can be empty.

62. 55 Fed. Reg. at 48038, col. 2 (emphasis added).

63. The State of New York, Dept. of Env. Cons. wrote of the proposed rule that "[t]he draft regulations are totally devoid of any implementable national objective for municipal stormwater permits." The N.Y.D.E.C. further stated that "EPA is obligated to give the State a much better definition of MEP" (maximum extent practicable—i.e., the level of control required) and recommended "a body of nationally approved BMP guidelines" for the permits.

64. 55 Fed. Reg. at 48038, col. 3 (emphasis added).

TESTIMONY OF MARTHA PROTHRO, ACTING ASSISTANT ADMINISTRATOR, OFFICE OF WATER, ENVIRONMENTAL PROTECTION AGENCY

Good morning, Mr. Chairman and Members of the Subcommittee; I am Martha Prothro, Acting Assistant Administrator of the Office of Water at the United States Environmental Protection Agency (EPA). Accompanying me this morning is Michael B. Cook, who is Director of the Office of Wastewater Enforcement and Compliance within EPA's Office of Water. I am grateful for the opportunity to testify this morning. Along with last Wednesday's hearing and those scheduled in the weeks to come, today's hearing provides a valuable opportunity to examine a variety of issues surrounding reauthorization of the Clean Water Act (CWA), and an occasion for the Administration and the Congress to share our views.

While the Administration has not had time to take positions on most of the funding provisions in the S. 1114, I would like to point out several major differences between the bill and the President's budget. First, the authorization level for the Clean Water SRF in the bill starts at \$2.5 billion in FY 1995 and can increase by \$500 million each year until the year FY 2000, when it can reach \$5 billion. This compares to \$2 billion per year in the President's proposal for FY 1995 to 1998, a difference of \$5 billion over the four years. Second, S. 1114 authorizes \$300 million for nonpoint source grants in FY 1995 increasing to \$600 million in FY 2000, compared to \$100 million per year in the President's proposal. We acknowledge the Committee's efforts to tie spending to government-wide deficit reduction goals. However, we are concerned that the levels proposed in S. 1114 may be unrealistic to meet the discretionary spending caps in the revised Budget Enforcement Act endorsed by the Congress and the Administration.

I will address my remarks to four areas of concern: the future federal role in funding our nation's wastewater infrastructure; funding of our regulatory programs through permit fees; controlling discharges from combined sewer overflows (CSOs); and, controlling storm water discharges.

STATE REVOLVING FUNDS

For nearly four decades now, the federal government has provided substantial funds to local communities for constructing wastewater treatment works and other water quality projects. Since 1972, with the passage of a comprehensive package of amendments we now know as the Clean Water Act, EPA has distributed more than \$60 billion to improve the quality of the nation's waterways. Most of these federal funds have been awarded under Title II of the Act as direct grants to local communities for the construction of wastewater treatment works. Today, federal dollars are capitalizing State Revolving Funds (SRFs), which are operating in all 50 States and Puerto Rico.

It is very important for the States to be able to fund necessary water pollution control efforts. Through federal capitalization of State revolving loan funds, we help the States provide assistance to local communities striving to achieve water quality standards and comply with the mandates of the federal law. Because great strides have been made in improving water quality from traditional point sources such as municipal wastewater treatment plants and industrial dischargers, our priorities are now shifting to include the newer mandates to control combined sewer overflows, storm water discharges and nonpoint sources of pollution.

Because of differences in the pollution problems affecting the different watersheds, the costs of complying with water quality standards and guidelines are unevenly distributed among States and communities. In some cases, such as some cities with combined sewer overflow control needs, the costs are extraordinarily high on a per capita basis. In addition, some needy communities face risks to their local environment and public health because they simply cannot afford the costs of treating wastewater on their own. This raises a troubling issue of environmental equity for the people in needy communities who cannot afford to pay the full costs to clean up the local environment or may even have an incentive to accept the pollution that wealthier areas reject in order to increase local income or employment.

Economic conditions in many States in recent years have prevented them from capitalizing their SRFs beyond the minimum required in the Act. Additional capitalization from the federal government will help ensure that the funds will be able to continue meeting wastewater treatment needs in the future. Without additional capitalization, existing State SRF programs will not generate funds to provide even current levels of State and federal assistance to localities. Thus, although municipalities bear most of their own wastewater treatment costs, there continues to be an important role for the federal government in financing water pollution control efforts.

BACKGROUND

The SRF program was established in the 1987 amendments to the Act. In that year, Congress decided to phase out the Title II construction grant program, and replace it with a new mechanism for funding wastewater treatment and other water quality projects. The SRF program has brought a fundamental change in the relationship among all levels of government in clean water funding. No longer is the federal government awarding grants directly to local communities, with the State acting as intermediary. Instead, EPA now awards grants to States to capitalize State Revolving Funds (SRFs). From these funds, States can make low interest loans and provide other types of assistance (but not grants) for the construction of publicly-owned wastewater treatment works, and for a wide range of nonpoint source and estuary protection projects and activities.

Congress was very far-sighted in requiring a shift to SRFs. As SRF loans are repaid into the funds, they become available to other communities that also wish to borrow. In this way, the SRFs are largely self-sustaining, providing funds for water quality far into the future. This self-sustaining feature is critical to the success of the funds.

The transition from the Title II construction grant program to the Title VI SRF program has gone well. Over \$7 billion of federal capitalization grant funds have been awarded to the States. These funds, along with State matching funds and bond proceeds, have made more than \$11 billion available to localities for needed water quality projects. More than 1300 municipalities have received low interest loans through the SRF. Approximately 70% of the loan assistance provided to date has been for the construction of secondary and advanced wastewater treatment plants. Another 25% has been used for sewer construction. The remaining 5% has been made available for combined sewer overflow abatement, storm water control, nonpoint source management and other projects.

The SRF program is widely considered a success, and a prototype for the federal, State and local partnership in infrastructure financing. SRF loan repayments continually replenish the funds, making more dollars available for water quality improvement projects. States can use their SRF accounts to issue bonds and thereby leverage the amount of funds available for project assistance: According to reports from the States, SRF funded projects proceed faster and at a lower cost than projects funded by direct construction grants.

The success of the SRF program lies in the degree of latitude it allows States to fund projects and activities that reflect real environmental priorities. Like its predecessor, the construction grant program of Title II, it has been notable for an absence of the scandals that sometimes afflict other federal funding programs. Indeed, the SRF program has essentially fulfilled the hopes of its creators. It has become the prototype for a federal, State and local partnership in infrastructure financing.

Underlying the enactment of the SRF program in 1987, was Congress's vision of the federal role in funding water quality facilities. With an adequate funding commitment from the federal government, responsible stewardship, and additional funding by State officials, wise use of innovative financing techniques, and a well-understood level of wastewater treatment needs, the SRFs could be counted on as the

chief source of funding for water quality projects and activities in the years to come. It was assumed that, by 1994, federal funding would no longer be necessary.

By the end of this fiscal year, appropriations for the SRF program will nearly match the amount authorized by Title VI in 1987. State officials have managed the funds effectively, and many States have found innovative means to stretch SRF dollars further. Unfortunately, SRFs are not yet able to meet water quality needs. If States had to rely upon repayments and current levels of State funding alone, SRFs would only generate about half the level of assistance which was provided to municipalities over the last 10-15 years under the construction grant and, more recently, SRF programs. Moreover, the number and cost of needed water quality projects has escalated well beyond what we predicted in 1987. In particular, we now have a better understanding of the costs of addressing wet weather problems (i.e., combined sewer overflow abatement and storm water management). We also have new, more-stringent water quality standards to meet in many areas.

In the intervening years, we have improved our understanding of the wide variety of human activity that impairs the quality of our waters. Along with our improved understanding, comes an increased appreciation of the costs that we must bear to restore water quality.

The Agency will soon release the results of the 1992 Needs Survey. The total estimated needs, which include both documented and modeled needs, have increased to well over \$100 billion. The combination of increasing needs and undercapitalization argues strongly for continued federal financial support for the SRF program.

Authorizations for the current SRF program are scheduled to expire in fiscal year 1994. Nearly \$9 billion has been appropriated to date for the SRF program. The President's budget includes \$1.2 billion for fiscal year 1994, and \$2 billion for each of fiscal years 1995 through 1998—an additional \$9.2 billion which, when funded, would double the amount currently available.

We have learned a lot since the first Title VI grant was awarded in March of 1988, and we have some suggestions on how to improve the program. I will summarize some of our recommendations in six broad areas.

Expanding Eligibility for SRF Funding

The first issue I would like to discuss is the expansion of the projects and activities eligible for assistance under the SRF program.

Under section 201(g)(1) of the current law, only 20 percent of the amount of capitalization grant funds can be used for combined sewer overflows, storm water pollution control and other sewer projects. With the growing evidence of water quality problems associated with wet weather flows, EPA is proposing to remove statutory limitation on funding of combined sewer overflow and storm water management projects.

We are also considering SRF eligibility for development and implementation of water use efficiency activities, including installation of water saving plumbing fixtures and for development and implementation of pollution prevention plans and activities. These activities can reduce the need for costly expansion of treatment capacity.

Possible Funding Limitations

Activities eligible for funding under the current statute are, in many ways, unrestricted by the current statute. Funding of nonpoint source management activities is particularly open-ended. One interpretation of the current statute is that any activity that a State includes in its section 319 plan is eligible for SRF assistance. We are concerned that some States are proposing projects that may contribute to water quality improvement, but primarily address other environmental objectives or public purposes. For example, some wish to use SRF funds for municipal landfills or to correct leaking underground storage tanks.

A number of issues have also arisen with respect to the eligibility of various private parties to receive SRF assistance. These issues have emerged most prominently in recent years, with the completion of nonpoint source management plans and the movement away from a sole focus on traditional publicly-owned treatment works. Consequently, within the Agency we have questioned whether we should limit SRF-eligible activities in some way based on the purposes, benefits, or ownership of the measures that are proposed for funding. We are currently reviewing these issues and will formulate our position in the near future.

Project Targeting and Priority Setting

Ensuring that States can target funding for State priorities is fundamental to the SRF program. States are required to fund municipal wastewater treatment facilities

based upon priority systems and priority lists. No such requirement exists for State funding of nonpoint source or estuary projects.

We are considering whether changes should be made to the SRF program to provide for States to adopt comprehensive priority systems for all activities eligible for SRF funding. This could help to ensure that scarce SRF funds go to projects with highest returns in terms of water quality improvement and risk reduction.

Meeting the Needs of "Needy" Communities

We are often urged to make fundamental changes to the SRF program to better meet the needs of "needy" communities.

Under the current SRF program, States may provide loans to communities with interest rates ranging from zero percent to market levels. It has become apparent that some communities cannot afford to repay SRF loans even at zero percent interest. These communities are not well served by other sources of loan financing because of their limited credit-worthiness. Projects in these Communities are often expensive on a per capita basis. Many States and groups representing small and economically disadvantaged ("needy") communities have recommended that certain changes be made to the SRF program which would enable States to provide more-affordable financial assistance.

In the short term, we are requesting funding only for cities that meet certain hardship criteria. For FY 1994, we have proposed that grant funding would be available to any city that has more than \$2 billion in documented needs and user charge rates that exceed 0.65 percent of median household income. Currently, only the city of Boston meets both criterion for "needy cities" grants, and the Agency supports an authorization of \$100 million for the program in FY 1994. We will continue to consider whether other provisions would be appropriate for the long term. We look forward to working with the Subcommittee in this regard.

The loan and grant programs of the Rural Development Administration (RDA) will play a key role in providing assistance to small communities that cannot afford SRF loans for the total cost of their projects. The RDA will receive significant increases in funding under the Administration's budget proposal and will increase emphasis on helping communities to meet environmental requirements in its loan and grant programs. Over the period from FY 1994 to 1997, the President's budget proposal for RDA would provide more than \$2.4 billion in grants and more than \$3.9 billion in loans to rural communities to assist with wastewater treatment needs. EPA is working with RDA to encourage selection of projects based on environmental benefits as well as financial need.

In addition, we recommend some adjustments to the SRF program to better serve communities for which traditional SRF assistance may not be the answer. We seek authorization to use up to one percent of the Title VI appropriation for making grants to Indian Tribes and Alaska Native Villages for the construction of wastewater facilities pursuant to Title II. Our proposal includes authority to provide the allotment under Title VI to the District of Columbia, Virgin Islands, Pacific Trust Territory, Guam, and other single level-of-government jurisdictions in the form of grants for implementation of activities eligible under Title VI.

Capitalization Options for the SRF Program

Perhaps the most basic questions we must face in our discussions on reauthorization of the SRF program are: how much can the federal government afford to contribute to the program, and, what changes are needed to ensure the long-term financial health of the program, including additional capitalization beyond the currently proposed federal authorization period?

The answer to these questions is dictated by national budget constraints and issues relating to the federal role in such funding. For fiscal year 1994, we propose authorizing \$1.2 billion for Title VI. For fiscal years 1995 through 1998, the authorization should increase to \$2 billion a year. Based, on the current SRF program, the Agency estimates that over a twenty year period States will provide SRF loans at a total value of approximately two and a half times the initial federal capitalization.

Since 1987, EPA has been allotting funds to States in accordance with a Congressionally-established formula that reflected the needs and population patterns that existed at that time. In the past few years, our understanding of needs has improved and, of course, populations have shifted. It is now appropriate to reexamine our needs estimates and growth rates and develop a more suitable allotment formula for the years to come.

In the past, Congress has been responsible for devising the allotment formula. When Congress has chosen to consult with us as part of their deliberative process, we have encouraged Congress to consider relative needs as one of the primary fac-

tors that should be given weight in deciding the equitable distribution of such a large amount of federal funding. We have always supported Congress making the decisions in this area, because the very nature of allocating funds among States is fundamentally more appropriate for Congress than for the Agency. We stand ready to provide technical assistance, as we have in the past, but ultimately this process is best accomplished through the legislative branch.

Leveraging

We note that S. 1114 would require States to make binding commitments equaling 200 percent of their capitalization grants, rather than 120 percent as under current law. This would compel many States to leverage fund accounts. Although the Administration has not had time to analyze this measure thoroughly and to take a final position, we foresee the following problems. First, in order for leveraging to succeed, a State must have a large number of projects ready to receive loans immediately, in order to ensure that interest earnings are available immediately to the State to meet its bond market repayment obligations. Many States are not in a position to do this. As a consequence, under a mandatory leveraging program, funds from these States would have to be reallocated. Second, in order to make leveraging work, States need to charge interest rates that are higher than the interest they are paying on their bonds. Several states have predominantly small and needy communities and tend to give very low- or no-interest loans to a majority of their SRF borrowers. If these States raised their interest rates significantly in order to pay off leverage bonds, many local participants might be unable to obtain needed loans. Finally, leveraging provides only short-term benefits (in terms of increasing the number of projects that can be funded); over the long term, interest earned by the State is used to pay off bonds instead of providing for future assistance. Thus, the size of the program may actually decrease in some cases.

OTHER FUNDING ISSUES

While the SRF program provides the major share of federal funding for water quality projects in the U.S., there are other funding issues that we must examine in the context of Clean Water Act reauthorization.

The population along our 2,000 mile boundary with Mexico has grown enormously in recent years, in towns and cities south of the border and in the "colonies" of U.S. border States. This population growth has been accompanied by a number of serious water quality problems. Several contaminated Mexican waterways flow into the U.S., threatening the Imperial Valley of California, the area of Nogales, Arizona and other important U.S. water resources. In many areas, the U.S. and Mexico share surface and ground-water resources that have become polluted. In many of the colonies, where hundreds of thousands of people have settled, basic sanitation facilities are lacking.

Almost \$130 million have been appropriated through fiscal year 1993 for wastewater treatment facilities in the vicinity of San Diego and Tijuana Mexico, to correct water pollution problems along the ocean beaches and estuaries near San Diego. In fiscal year 1993, \$70 million have been appropriated for assistance to the colonies. For fiscal year 1994, the Agency is requesting an additional \$150 million for a range of projects and activities. This figure includes \$70 million for the Tijuana project, and \$20 million for other wastewater treatment projects along the border. The remaining \$60 million will be for the colonies.

In general, we oppose earmarking SRF funds for particular purposes. The SRF program should remain the primary vehicle for meeting the funding needs of States and municipalities, other than small communities funded through RDA. However, we are concerned about the cost burdens faced by several communities. For truly hard-pressed communities, those for whom SRF funding may not be a feasible alternative, the Agency is now exploring other options.

PERMIT FEES

The next subject I will discuss is permit fees. The 1987 amendments to the CWA contained a number of major new mandates, including new program responsibilities relating to storm water permitting, sludge management, and water quality standards. We recognize that States are finding the costs to fulfill the mandates to be very burdensome and have often had to divert substantial resources from their base scientific and regulatory activities into areas of new mandates. While the State funding problem is primarily a problem the States must themselves address, the federal government can help and, since the States are critical to the success of the CWA, the federal government should help. In order to help the States, we are study-

ing options to ensure that States have adequate funding to execute their responsibilities. One option would be mandating State permit fees as a condition of program approval, possibly modeled after those in the Clean Air Act, that would be designed to recover the cost of State permit, enforcement and monitoring programs.

Currently, the main federal authority for the water program to develop a permit fee structure is found in the Independent Offices Appropriations Act or IOAA, which authorizes a fee for service to a discrete entity. Our ability to use the IOAA to recover the costs of broadly applicable efforts, such as the development of regulations and standards, or activities which appear to provide no direct tangible benefit to the permittee, such as compliance monitoring, is not clear. Without specific authority to develop program cost recovery fees, it is unlikely that States or EPA will have sufficient ability to recover the costs of developing and administering these programs.

We need authorization to recover the costs of developing and implementing generally applicable regulations, standards and guidance, as well as those specific to an industry category. We seek specific authorization to recover the costs of monitoring compliance and ambient water quality, conducting laboratory quality assurance activities, creating and maintaining data inventories, responding to inquiries (including the development of status reports on program implementation), and implementing the fee system itself. This fee system would not be for punitive purposes or to fund the general treasury, but specifically to fund the implementation of the NPDES, pretreatment and sludge programs.

Thirty-nine States have developed wastewater fee systems; however, few are sufficient to fully fund the program and several are not sufficient to bring total funding to adequate levels. We believe that authorizing a federal fee program in unauthorized States and States with inadequate fee programs of their own will serve as a powerful example and incentive for States to develop appropriate systems.

Current State fee systems must be considered, however. Some are sufficient to recover a majority of program costs even now and need not be abandoned. Others, while insufficient in monies collected, use fee schedules or formulas which have gained the acceptance of the regulated community through the years. Some fee systems are based strictly on flow. Others consider categories of discharge. Some are annual fees based on loadings of toxic pollutants and may promote pollution prevention, while others recover flat fees for the processing of an application. No one method is the best; each has its merits. The States should be given latitude in determining the basin for fees. The most important factor is the sufficiency of the resulting revenues. This could be encouraged through imposition of a federal fee system based on a rough measure of sufficiency for program costs and then providing deference to acceptable State fee systems.

COMBINED SEWER OVERFLOWS

Discharges from combined sewer overflows (CSOs) remain a significant threat to public health and the environment in over 1100 communities serving 43 million people. The costs to correct this public health and water quality problem are significant. However, existing statutory authority is sufficient to allow EPA and States to tackle this problem through the NPDES program. In 1993, EPA published a Draft CSO Policy that constituted a breakthrough in correcting the CSO problem, notably because it reflected fundamental agreement among States, cities and citizens groups and also recognizes the site specific nature of CSO impacts and the ability of communities to pay for the necessary controls.

Today, most cities in the United States have separate sewer systems for storm water runoff and for sanitary wastes. However, in the older sections of the country, primarily in the Northeast and Great Lakes regions, combined sewer systems still exist. During dry weather, combined sewer systems carry sanitary wastes and commercial and industrial wastes to publicly owned treatment works. In periods of rainfall, however, the storm water runoff can greatly exceed the capacity of the combined sewer system and overflow the structures that normally divert the wastewater stream to the publicly owned treatment works. The storm water—along with the sanitary and industrial wastewaters that are in the system—then flows directly into surface water bodies such as lakes, rivers, estuaries, or coastal waters. These resulting overflows from the combined sewer systems are called CSOs.

CSO discharges contain pollutants from raw domestic sewage, industrial and commercial wastes, and storm water runoff. Raw sewage from households can introduce pathogenic bacteria into swimming waters and drinking water supplies. Other pollutants cause biochemical oxygen demand that depletes the oxygen in the water and alter aquatic ecosystems. From commercial and industrial waste components, the

overflows can contain additional nutrients, metals, bacteria, toxic organics, dissolved and settleable solids, and floatable materials. The storm water component contains sediment, organic waste, toxic materials and floatable debris washed from streets, lawns and gardens, parking lots, construction sites, and industrial areas.

Numerous studies have concluded that CSOs are major contributors to water pollution in some water bodies. For example, the Natural Resources Defense Council is conducting a continuing investigation of beach closings. Their first report, in 1991, stated that "[h]igh levels of bacteria in coastal waters are responsible for the overwhelming majority of the beach closures and pollution advisories in the 10 States studied." More than 2400 beach closures and pollution advisories issued in 1989 and 1990 were due to the presence of high levels of bacterial contamination.

Like all point sources of pollution, CSOs are covered under the Clean Water Act. Under the NPDES program, municipalities must have permits for their CSO discharges. These permits are intended to ensure that the discharges will not cause the receiving waters to violate applicable water quality standards (including any uses, such as fishing and swimming, that have been designated for those waters), and that the discharges meet the technology-based requirements of the Act.

Historically, control of CSOs has proven to be extremely complex for a number of reasons. First, CSOs can exhibit extreme variability in the volume, frequency and characteristics of the discharge. Second, compared to other waste water treatment technologies, relatively few studies have been completed that document the efficiency or cost effectiveness of CSO controls. Third, while we know that CSOs can have significant impacts on water quality, there has been difficulty distinguishing contributions to water quality impacts by CSOs from impacts from other sources (e.g., non-point sources) during wet weather events. Last, and probably most important, are the financial considerations for communities with CSOs.

In an effort to resolve these challenges, EPA's Office of Water issued a National Combined Sewer Overflow Strategy on August 10, 1989. The strategy reaffirmed that CSOs are point sources subject to NPDES permit requirements and the Clean Water Act. The 1989 Strategy recommended that all CSOs be identified and categorized according to their status of compliance with these requirements. The strategy set forth three objectives: a) to ensure that if CSO discharges occur, they are only as a result of wet weather; b) to bring all wet weather CSO discharge points into compliance with the technology-based requirements of the CWA and applicable State water quality standards; and c) to minimize water quality, aquatic biota, and human health impacts from wet weather overflows. In addition, the strategy called upon the States to produce State-wide permitting strategies designed to reduce pollutant discharges from CSOs.

While the 1989 Strategy was successful in focusing increased attention on CSOs, the Strategy fell short in resolving many fundamental issues. In January of this year, EPA published in the *Federal Register* (58 FR 4994) a Notice of Availability for a draft CSO Control Policy. The permitting portions of the Policy were developed as a result of extensive input received during a negotiated policy dialogue with key stakeholders including municipal groups, States, environmental groups, and other interests. The negotiated dialogue was conducted through the Office of Water's Management Advisory Group. The public comments on the Draft Policy have been highly supportive and indicate that the Draft Policy was successful in dealing with issues that had prevented significant progress in the past. The policy contains provisions for developing appropriate, site specific NPDES permit requirements for all combined sewer systems that overflow as a result of wet weather events. The Draft Policy also provides for enforcement initiatives to require the immediate elimination of overflows that occur during dry weather and to ensure that the remaining CWA requirements are complied with as soon as possible.

First, the Policy would have CSO permittees immediately undertake a process to accurately characterize their combined sewer systems, demonstrate implementation of the nine minimum controls, and develop a long-term CSO control plan. Once the long-term CSO control plan is completed, the permittee will be responsible to implement the plan's recommendations as soon as practicable.

Second, State water quality standard authorities would be involved in the long-term CSO control planning effort to coordinate the review and possible revision of water quality standards and implementation procedures on CSO-impacted waters with the development of the long-term CSO control plan.

Third, NPDES authorities would issue or reissue permits to require immediate compliance with the technology-based and water quality-based requirements of the CWA, and after completion of the long-term CSO control plan, incorporate the appropriate requirements into NPDES permits.

Lastly, NPDES authorities would also commence enforcement actions against all CSO permittees which have CWA violations due to CSO discharges during dry weather. In addition, NPDES authorities should ensure the implementation of the nine minimum controls and incorporate a schedule, with appropriate milestone dates, to implement the required long-term CSO control plan into a civil judicial action or administrative order.

We believe that this Draft CSO Policy has been met with great acceptance because of the appropriate considerations given to: the need for sound characterization of combined sewer systems; the site specific nature of CSO impacts; the need for effective planning and public participation; special emphasis for environmentally sensitive areas; and the recognition that municipal affordability affects the timing of CSO control implementation.

Our goal is to publish a final policy in the Federal Register in October 1993. About the same time, EPA plans to issue a number of final and draft guidance documents to support the implementation of the Final Policy.

We believe that revisions to the CWA are unnecessary to properly control CSOs. The existing CWA provides sufficient legal authority to implement the draft policy and bring CSOs into compliance with CWA requirements and State water quality standards.

A few comments on CSO costs are important. Our soon to be released 1992 NEEDS survey provides us with estimates of the costs for cities to achieve the degree of controls outlined in EPA's draft CSO policy. We estimate the CSO abatement costs to these 1100 cities to be about \$43 billion. To help put this estimate into perspective, this country has invested approximately \$80 billion in the nearly 15,000 publicly owned treatment works in the United States. Another important aspect of the \$43 billion estimate is that it is not equally distributed among the 1100 communities with CSOs. We believe that a relatively small number of large cities will bear a significant portion of the total cost.

By way of reminder, we are talking about approximately 1100 cities with combined sewer systems serving a population of about 43 million. Almost 85% of the systems are located in eleven States in the northeast and Great Lakes (Maine, Massachusetts, Vermont, New Jersey, New York, Pennsylvania, West Virginia, Illinois, Indiana, Michigan and Ohio. While many large cities like Boston, New York, Chicago, and San Francisco have combined sewer systems, over 60% of the 1100 systems serve populations of fewer than 10,000.

STORM WATER

The storm water program is based largely on the 1987 Water Quality Act amendments. States report that storm water discharges from diffuse sources are responsible for approximately one third of remaining assessed surface water impairment. The 1987 Amendments established a two phased program to address the discharge of contaminated storm water to our nation's water. Phase I of the program more than doubled the size of the existing national industrial and municipal NPDES permit program. Phase II has the potential for further increasing the size and scope of the NPDES program more than *ten* times again.

Under Phase I, section 402(p) specifically requires EPA to establish a storm water program with permit application and issuance requirements both for industrial activities and for municipal separate storm sewer systems over 100,000. In November 1990, the Agency issued Phase I application regulations for 220 municipalities and counties as well as 11 categories of industrial activity. Under Phase II, EPA is required to develop storm water program strategy to address all remaining storm water discharges to protect water quality. These include contaminated storm water discharges from light industrial, commercial, retail, residential activities as well as small municipalities.

EPA and States have made impressive progress on Phase I with limited resources. However, there is a tremendous amount of work left to be done, and there are several important issues that should be considered in the context of reauthorization. Over 100,000 industrial activities and more than 250 municipalities and counties have been identified for permit issuance under the Phase I storm water program. More than half of identified industrial activities have been covered by either EPA or State general permits, but tens of thousands still do not have coverage under Phase I permits. On the municipal side, EPA and States have received municipal permit applications from most of the large and many of the medium municipalities. States and EPA Regions must now work with each of these municipalities and counties in developing and issuing systemwide storm water permits. The real Phase I challenge for all of us is to continue the national momentum and assure

that storm water permit coverage translates into effective on-the-ground storm water management practices and achieves real environmental gains.

Under the CWA, municipal storm water permits must require immediate compliance with effluent limits based on applicable State water quality standards. Given the complexity of storm water discharges and controls and the time it takes to implement municipal or county-wide storm water management practices, immediate compliance will simply not be possible for many cities. Providing one or more five year permit terms to meet water quality standards may be a reasonable alternative.

Under current CWA provisions, the storm water program requires CWA permits for industrial activities even if they are discharging to municipal separate storm sewer systems, which also must obtain storm water permits. Some have argued that this approach is redundant and inefficient, and also undercuts the effectiveness of municipalities in dealing directly with industrial facilities discharging to municipal systems. One possibility in this area would be to allow EPA to authorize municipalities to establish programs for storm water permit issuance and controls where they have the appropriate authority and are willing to commit to implement national storm water requirements.

On the industrial side, providing facilities with a mechanism to avoid regulation under the storm water program where there is no exposure of materials, equipment, or wastes to storm water is an approach that may create powerful incentives for industry to adopt storm water pollution prevention practices. EPA originally established so called "opt-out" provisions for light industry as part of its 1990 storm water application rule. These provisions, however, were overturned by the Ninth Circuit Court of Appeals as inconsistent with CWA statutory storm water provisions. This is an area in which additional flexibility for EPA and the States might allow us to accomplish the pollution prevention objectives of the storm water program in some cases without the need to issue a permit.

With regard to Phase II of the storm water program, which is not due for full implementation until October 1, 1994, EPA has undertaken several outreach efforts to solicit input on potential scope, control strategies, and appropriate deadlines. Over the past year, EPA has held 6 public meetings to discuss and receive comments on how best to approach Phase II. In September of 1992, the Agency also issued a Federal Register Notice requesting additional comment. We are evaluating available information on activities that may be covered and assessing a number of possible approaches on how to proceed with Phase II. Initial estimates indicate that Phase II has the potential to affect more than 1,000,000 (and perhaps as many as 7 million) additional commercial, retail, and light industrial discharges.

We are presently developing different options for a Phase II strategy that will provide the most effective targeting of high risk sources, and identify appropriate roles for federal, State, and local government. We are attempting to strike the right balance between pollution control under the nonpoint source program and the issuance of permits under the NPDES program. We generally think that many Phase II sources may best be addressed under an expanded and strengthened nonpoint source program, while reserving the authority to regulate any storm water discharge as a point source if control efforts under the nonpoint source program fail or are deemed inadequate.

CONCLUSION

With some modest changes to the programs I have outlined today, and continued leadership by the federal government, I believe we can achieve the goal of cleaning up the nation's waters for the generations that follow us.

Thank you Mr. Chairman. I will be happy to answer any questions that you and the other members of the Subcommittee may have.

TESTIMONY OF TERRY AGRISS, PRESIDENT, NEW YORK ENVIRONMENTAL FACILITIES CORPORATION

Mr. Chairman and members of the Committee, I am Terry Agriss, President of New York State's Environmental Facilities Corporation. I am pleased to appear before you today to testify both in that capacity and as President of the Council of Infrastructure Financing Authorities (CIFA). CIFA is a national organization of State and local authorities whose mission is to facilitate financing of public infrastructure facilities. Most of our State members manage at least the financial component of the State Revolving Loan Funds (SRFs) for wastewater treatment, and as such, are vitally interested in the future of the SRF program.

My testimony will address Title VI of the Clean Water Act and the SRF provisions. Briefly, we support a reauthorization of this program which, from our experience as State managers, is operating as an extremely efficient and economic means to provide low-cost financing of public wastewater treatment needs. Clearly, the SRFs have fulfilled the vision which Congress had when it created the loan funding mechanism in 1987, and we are pleased that the Title I provisions in S. 1114 reflect this Committee's continued bi-partisan support to maintain and expand the SRFs.

We urge the Committee and the Congress to extend the programmatic and financing authority for Title VI which, with some minor legislative adjustments, can address the nation's major needs for wastewater funding well into the next century. In support of this assertion, let me respond to some questions which the Committee may wish to pose:

I. Is the SRF Mechanism Working?

With five years experience, we are pleased to say that the SRF program is working and working well. All 50 States and Puerto Rico have met the requirements of Title VI of the 1987 Act, having passed the requisite laws, provided the necessary matching funds, and set up the administrative and financial management mechanisms to effectively put the program in place. All of these State programs are now fully operative, making low interest rate and interest-free loans to communities to meet their wastewater financing needs.

A survey undertaken by the Ohio Water Development Authority of all State SRF programs found that as of June 30, 1992, States had received nearly \$6 billion in federal capital grants for their SRFs. This federal investment, together with \$1.4 billion in State matching funds and over \$5 billion created by leveraging the individual State Funds, has formed a total lending pool of \$10.7 billion from which 1,363 project loans have been made. It is noteworthy that the federal contribution has been nearly doubled by state match and leveraging of the funds. The ability to leverage the fund and its revolving nature comprise the distinguishing features of the SRF—its capacity to take a limited federal capital contribution and parlay it into expanded long-term financing.

II. Is There a Need for Further Federal Financial Assistance?

The present equity in the SRFs is not enough to fully finance necessary municipal treatment projects. Nationally, wastewater treatment funding needs are now estimated in excess of \$100 billion. New federal requirements for combined sewer overflow correction and storm water pollution abatement as well as non-point source controls, will cause these estimates to escalate. In New York State, estimated treatment needs are \$24.3 billion. In your state, Mr. Chairman, our Florida member advises that the State has estimated needs of \$6 billion over the next 20 years. These are costs for legitimate projects necessitated by requirements of the Federal Clean Water Act under consideration here today. If Congress expects states and communities to meet these mandated requirements, it must continue to provide financial assistance. Without it, you will see a deterioration in municipal compliance which will endanger not only our nation's water quality, but erode the foundation of the cooperative compact between the localities, the states and the federal government, in accomplishing our environmental objectives. It is that simple.

III. Are SRF's the Most Efficient Means of Delivering Assistance?

From the state and national perspective, there is a definite advantage to loans over project grants. While we appreciate that some municipalities would prefer grant assistance over a subsidized loan, and that you may be hearing this from your constituents and colleagues, there are sound reasons, in terms of economy of national expenditure and efficiency of project financing, for Congress to maintain the SRF funding approach. Most importantly:

Loans Provide Assistance to More Projects: The combination of the state match, the debt service payment, and the additional funds that can be made available by leveraging, creates a loan pool capable of financing a much larger share of project needs than would a grant program.

For example, if the SRF were funded at \$2 billion a year for 12 more years with the existing 20% state matching requirement and a leveraging factor of 2:1 for 60 percent of the Funds (the amount of leveraging now anticipated), a loan pool would be created capable of financing \$133 billion in projects over the next 20 years. The same amount of federal assistance, directed to grants for 55% of the costs of eligible projects, would finance only \$44 billion in wastewater projects—less than one third of the amount that could be financed through the loan program. Moreover, with the loan program, new projects will

continue to be financed after federal contributions stop, whereas the grant assistance program stops with the last federal contribution. With the growing dimension of estimated need for wastewater funding it seems clear that responsible federal programs should be aimed at sustaining and enhancing the loan program. A graphic depiction of this SRF scenario, is attached to my testimony.

Low Interest Loans Provide Substantial Subsidy to the Rate Payer: At a time of impending rate-payer rebellion, SRF below market loan rates can substantially reduce the long-term financing costs for public infrastructure. For example, a \$10 million dollar project financed through the SRF at approximately 250 basis points (2.5%) below market rates, would save the rate payers \$3.1 million in interest costs over the 20 year loan repayment period.

Extrapolating this subsidy to the entire national SRF program, assume that the \$10.7 billion in the loan pool is loaned at an average interest rate of 3.5% against an average market rate for tax exempt borrowing of 6%. The total saving to the borrowing communities and their rate payers over the period of loan repayment would be approximately \$3.3 billion. Some will argue that this still does not compare favorably to a grant subsidy, but one must remember that project grants, on average, cover approximately only 40% of the total project costs. The remaining 60% must be financed by the community, usually through borrowing with tax-exempt bonds at the market rate, which will be several hundred basis points above the SRF subsidized loan rate.

Loans Will Contribute to Long-Term Federal Deficit Control: The permanent funding base provided by the SRF eventually diminishes the demand for future federal contribution. Loan programs begin revolving money for new projects almost immediately and can reduce the structural deficit by at least \$2 billion annually when the SRF is fully capitalized.

Loans Are More Efficient: Experience with the SRFs, thus far, has demonstrated their efficiency as compared to grants. Greater local responsibility under a loan program results in lower project costs, encouraging communities to build to meet their actual needs rather than building to meet grant eligibility. For example, in 1989, the Town of West Monroe in central New York State built a low pressure sewer system and treatment facility using \$650,000 in SRF loan proceeds and a \$45,000 state grant. By contrast, a few years earlier, the same town, anticipating a Title II grant, planned a facility to achieve the same environmental purpose which would have cost \$1,250,000. The record is replete with such examples.

Loans Are Less Bureaucratic: Loans, which are more efficient to manage from a federal and state perspective, significantly reduce the manpower requirements for federal supervision as compared to grant administration. Since 1987, total staffing in EPA's Wastewater and Enforcement Compliance program has been reduced by more than 100 FEES, reflecting, in part, the shift from grants to loan management.

Loans Fund Projects Faster: Because SRFs can fund the total cost of many projects, they remove the need for communities to raise the additional financing necessary to cover their matching share of the grant plus the non-grant eligible components of the project. Moreover, with full availability of financing, projects are being completed up to 50% faster than under the grant program. There is no waiting on grant priority lists or for EPA grant reviews. There is no adage in the construction business that "time is money." Expedited project construction leads to substantial savings.

Also, loan financed construction occurs more quickly because the loan program does not penalize communities that start their projects in advance of a loan. Because SRFs allow loan refinancings, municipalities are encouraged to begin the design and construction phase when they are ready. Costs of planning and design can be refinanced under the SRF program, so the borrower does not risk forfeiting future financial assistance by early project starts.

Since many SRF's have adopted a policy of immediate loan availability, there is no need for borrowers to arrange separate interim financing for the project, avoiding additional financing costs. States with large needs have been able to leverage their available loan funds and are operating under a policy that any project can be financed when it is ready. Leveraging can double or triple immediate available loan assistance.

IV. Is There Need For Additional Subsidy to Small Communities?

Even with interest-free loans, some small communities will still find the cost of loan repayment too onerous because of economic conditions in the community or ex-

ceedingly high compliance costs. In these situations, some additional subsidy may be advisable. CIFA supports authorizing States to use Principal Subsidies to reduce the cost of SRF loan repayments to manageable levels for hardship communities. In essence, a principal subsidy uses interest earnings from the SRF to "write down" a portion of the loan's principal. As proposed in S. 1114, the amount of principal subsidy should be geared to the ability of the community to afford the annual repayment costs.

An advantage of a principal subsidy program as opposed to a direct grant is that it can be run as a part of the SRF, thereby streamlining administration for both the borrower and the lender. We recommend that you give States latitude in how they provide for such subsidies within the context of the SRFs. For example, to protect the corpus of the fund, a state might set aside funds in an earmarked reserve, using the interest on the reserve to pay a part of the service costs on a community's subsidized loan. Other states may prefer to identify the repayment stream from strong credit risks, as a subsidy for weaker loans. In any event, the Committee is correct in limiting the percentage of the Fund that can be dedicated to such subsidies. While such subsidies require more capital from an SRF than an ordinary loan, most states with large rural populations and significant needs, are not currently leveraging their funds through the public bond market. By leveraging their SRF monies for projects in more credit worthy communities, states should have adequate funds available to make direct loans and principal subsidies to projects in their economically disadvantaged communities.

V. Is the SRF Adaptable to Addressing New Pollution Control Needs?

We are pleased that S. 1114 conceives of the SRF as the principal financing mechanism for a range of water related pollution control financings. Indeed, a number of states are already using their SRFs to finance combined sewer overflow and storm water control projects and correction of failed septic systems. A few states have made advances in using the SRF to finance non-point source control projects, and EPA should be encouraged to allow SRF funding for pollution prevention projects including measures for water conservation. While S. 1114 identifies all of these purposes as eligible for SRF financing, it ties them closely to the development of approved water quality management plans. In as much as many States are already financing these important control and remediation measures, I am sure it is not the intent of the Committee to delay such further projects until comprehensive plans have been completed and approved.

The SRF is an adaptable financing mechanism and we look forward to expanding its purposes to include the financing of Public Drinking Water Systems as proposed in President Clinton's new initiative. These water related purposes can all be effectively addressed through the SRF mechanism. In this respect, we would like to emphasize to the Committee the need to maintain flexibility for the states in managing the financial elements of the funds in order to achieve maximum efficiencies in fund management. For example, states should be allowed to commingle the SRF loan repayment stream with other State loan pool repayments including State drinking water SRFs, when authorized. For purposes of leveraging, it would be much more efficient to allow the combining of state and federal program funds into a single pool pledged to the same revenue bonds, recognizing that some accounting of loans made with the proceeds of these bonds would be needed to reassure EPA that the purposes of the SRF program are being fulfilled. We recommend that the Congress instruct EPA to provide maximum flexibility to the States in the management of the SRFs, in keeping with sound financial management practices.

VI. Are There Other Modifications That Would Improve the SD Program?

In addition to reauthorizing the SRFs, a few changes are needed in the Title VI provisions to make the program more efficient and manageable. Specifically, we recommend the following:

Eligibility of land For SRF Financing: As provided in S. 1114, extension of funding eligibility for land acquisition associated with wastewater collection and treatment should be allowed. With present limited eligibility for land acquisition, communities receiving SRF loans now have to find other sources of financing for project related land purchases, causing complications and delays in initiating project construction. Eligibility for land becomes especially important with the increased emphasis on correction of CSOs and non-point source problems where additional lands may be needed for run-off retention.

Administrative Costs: Cost of administering the Fund will continue and should be a legitimate use of a small percentage of each State's Fund, rather than being tied to a diminishing and eventually disappearing federal contribution.

We support the use of a small percentage of the total value of the Federal and States capitalization for purposes of administering the SRF for the life of the program.

Extended Loan Payback Period: For larger projects where principal subsidies are not efficient, States should have the flexibility to extend the loan payback period beyond the present 20 years. We would recommend reserving this benefit for special economic hardship cases tied to the project life rather than a specific number of years.

Technical Assistance: We support the provision in S. 1114 allowing States to use a portion of their matching funds to assist small communities with technical and financial management. From our experience in New York State, we are convinced that this small allocation of funds to technical and financial assistance will return larger dividends in terms of more efficient and cost-effective project design, realistic rate schedules that service debt and provide for adequate operation and maintenance and assurance of basic accounting and financial management practices.

With respect to small communities, however, I would like to raise an issue with the Committee with respect to the need for coordinated federal program. While there are legitimate cases of hardship in our rural and non-urban communities, it is not always the result of an absence of federal funding. In fact, there may be more federal funding available for small community water and sewer assistance next year than for all other communities in the nation. The U.S.D.A., Rural Development Administration budget request has close to \$1.3 billion in grant and loan funding for water and sewer. The Community Development Block Grant program provides grant assistance to small communities for public facilities including wastewater treatment, as does the Economic Development Administration. These programs were all increased under the Clinton FY 1994 budget, while the SRF program was dramatically reduced—leaving the nation in the potentially ironic position of advancing more federal assistance for small communities than for all the rest of the U.S. population. While this may be an anomaly of a new Administration's first effort at budgeting, it highlights a serious problem of lack of federal coordination with respect to clean water funding—a problem greatly exacerbated at the local level by a confusion of uncoordinated and dissimilar federal assistance programs. One useful initiative the Committee might direct, is for EPA to take the lead in undertaking an effort at coordinating a federal approach to small community assistance in the area of environmental facility financing. At present, the States are left with the task of helping their small communities sort out their best option from a welter of confusing and not always cooperating federally assisted programs.

Title II Provisions: CIFA supports the elimination of the grant related requirements in Title II of the Clean Water Act, which are now applicable to "equivalency" projects equal in dollar amount to a State's annual Capitalization Grant. These provisions, which include those defined in 201(b), 201(g)(1), 201(g)(2), 201(g)(3), 201(g)(5), 201(g)(6), 201(n)(1), 201(o), 204(a)(1), 204(a)(2), 204(b)(1), 204(d)(2), 211, and 218, are either redundant or extraneous to loan arrangements under the SRF, and in some cases add months and even years to the time required to move a project to construction.

Water Quality Infrastructure Needs Assessment: Authorization for an expanded needs assessment of all potentially eligible wastewater facilities to provide improved data on infrastructure financing needs is essential. This is an important component of the nation's information base on infrastructure inventory and needs and a measure against which to assess progress and future program direction.

We hope that these observations will be useful to you and the members of the Committee as you work to fashion the provisions that will reauthorize the nation's clean water law, and thank you for this opportunity to testify.

Annual Loan Obligations for SRF Program (Assumes Funding Ends in 2005)

- 1) Annual federal appropriation of \$2 billion, ending in 2005
- 2) Only states that are currently leveraging or expected to leverage soon are included in the leveraging program
- 3) Sixty percent of the program will be leveraged at two times the capitalization amount
- 4) Forty percent of the program will be direct loans at two percent interest rates
- 5) All loan programs are assumed to have a 1% return on equity
- 6) Includes recycling of SRF funds from 1990-93 capitalization appropriations

Prepared by the N.Y. State Environmental Facilities Corporation

TESTIMONY OF KENNETH BRUZELIUS, PRESIDENT, RURAL COMMUNITY ASSISTANCE PROGRAM, NEW PRAGUE, MINNESOTA

Good morning, Mr. Chairman and Members of the Subcommittee. I am Ken Bruzelius, President of the Board of Directors of the national Rural Community Assistance Program (RCAP) network. The RCAP network includes national, regional, state and local offices serving all 50 states and Puerto Rico.

Over the last 20 years, RCAP has provided on-site wastewater technical assistance to small rural communities. The communities RCAP assists are primarily very small communities with populations under 3,500, disadvantaged communities, and those with minority or underserved populations.

For example, Newburg, a community in Missouri with a population of 598, was issued an abatement order by the MO Department of Natural Resources as a result of long-standing, documented problems at its wastewater treatment facility. This enforcement action required that Newburg take immediate action to resolve these problems without consideration of the residents' ability to meet the costs of any improvements. The Midwest Regional RCAP—Midwest Assistant Program (MAP)—of which I am the executive director is currently providing technical assistance to Newburg at no cost to the community. These technical assistance efforts have resulted in marked improvements in the operation of the existing plant. MAP is also assisting the community leaders in Newburg to identify their wastewater treatment needs and to locate resources.

Wastewater Needs in Small Disadvantaged Communities

More than 29 million Americans lack access to basic wastewater treatment and disposal services (EPA 1990 Needs Survey). A study conducted by the North Carolina RCAP, found that nearly 250,000 residents of that state still use a privy, drain their raw sewage into streams, or lack running water. In Virginia, state officials estimate that 50,000 households lack indoor plumbing.

EPA's 1990 Needs Survey Report to Congress on Wastewater Treatment Facilities estimated the current need for wastewater facilities nationwide at \$110.6 billion, and reported that more than 80% of all communities in violation of sewage treatment requirements are in small (rural) communities.

As part of an analysis of wastewater facility financing (*Through the Revolving Door*) conducted by Rapoza Associates for the Center for Community Change, State Revolving Loan Fund (SRF) staff in 45 states were asked to rank existing small community compliance problems in order of frequency. They answered:

- failing on-site septic systems
- poor operation and maintenance
- inadequate level of treatment
- infiltration/inflow.

These responses confirm EPA Needs Survey findings that the use of inadequate on-site septic systems is prevalent in small (rural) communities and that these septic systems need to be replaced by new municipal collection and treatment facilities.

In a recent Government Accounting Office (GAO) report, a Montana official reported that in several small towns in his state raw sewage was overflowing from septic systems into nearby surface waters. Illinois alone has as many as 400 small (rural) communities with failing septic systems and deteriorating wastewater treatment systems. And, Utah state health department officials say they may have to condemn entire small towns because the towns cannot afford to make necessary improvements to their wastewater treatment facilities.

EPA Wastewater Funding and Small Communities

While more than 86% of all local governments serve populations of less than 10,000, a January 1992 Government Accounting Office (GAO) report on the existing Clean Water state revolving loan funds (SRF) noted that small communities are receiving less than a proportional share of financial assistance from the SRFs, given the percentage of population in these communities. The GAO report showed that communities with populations under 10,000 received 24% of the money loaned from the SRFs between 1987 and 1990, while they represented 38% of the total population. Although 70% of all US municipalities have populations of less than 3,500, only 11.7% of EPA Construction Grants were awarded to communities of this size.

In *Through the Revolving Door* several reasons were listed for the difficulties small communities have had in obtaining SRF funds. Many states consider the ability to repay the loan to be nearly as important as a community's health and environmental needs. Many small, disadvantaged communities cannot support the necessary user charges or rate structure to generate sufficient income to repay SRF

loans. Often, projects serving populations of under 1,000 cannot borrow from the SRFs without supplemental grants or principal subsidies. Communities of this size have limited debt service capacity and require 0% or negative interest loans to reduce loan repayments to an affordable level.

Also, while many small system projects are rated high on state priority lists they are often passed over for funding because they are not ready to begin construction. These small communities have part time leadership and need technical assistance to complete the necessary pre-construction studies and preliminary loan requirements. This technical assistance enables the community to plan for necessary improvements to system operations and management practices, set realistic yet affordable user charges, establish reserve funds for equipment replacement and repair, and develop future capital improvement plans to maintain compliance. It also provides small communities with assistance in evaluating and implementing restructuring and consolidation options.

S. 1114—Specific Recommendations

I would like to thank senator Baucus, Senator Chaffee and the Committee for their willingness to avoid the one size fits all" approach of many federal regulations and laws. Many of the amendments to the Clean Water Act proposed in S. 1114—including those related to the State Revolving Loan Funds Program and small and disadvantaged communities—acknowledge the necessity to solve wastewater treatment problems of small communities differently than large metropolitan cities.

RCAP offers the following comments and suggestions for consideration by the Committee:

(1) States should be required to set aside at least 15% of the total SRF (federal and state funds) each year for projects serving small disadvantaged communities as defined in S. 1114 and projects in unsewered small communities with failing (or failed) on-site septic systems. EPA Needs Survey data, GAO report findings, other wastewater needs data, and the fact that these communities have not been successful in obtaining a proportionate share of existing SRF funds readily justify the targeting of these funds.

(2) States should be permitted to use SRF matching funds to provide grants for planning and design assistance and other "up front" costs to small systems whether or not they are successful in getting a loan. S. 1114 now allows for award of these grant funds in the event a small system "does not receive a loan". However, many small communities—particularly disadvantaged communities—do not have monies to pay all of the upfront costs involved in applying for the SRF even if they may be reimbursed for these expenses (a grant) or the expenses can be added to the total loan amount when awarded.

(3) No one project should receive a loan from a state's SRF for an amount greater than 25% of the state's total SRF in a given year. The need for this restriction is obvious. The funds appropriated for the SRF program are insufficient to meet the needs nationwide or in individual states. These funds must be distributed to the greatest number of projects possible and not depleted by one or two large projects.

(4) States should be permitted to extend low-interest loan payments for up to 40 years for projects in small, disadvantaged communities or unsewered communities with failing septic systems. This offers another alternative to making projects in these communities more affordable yet maintains the integrity of the loan fund.

(5) In addition to the technical assistance by states included in S. 1114, provision should be made for national technical assistance specifically targeted to communities with populations under 3,500 and disadvantaged communities. RCAP strongly supports the provision of funds to the states for technical assistance related to Clean Water issues. However, the funds available to the states for this purpose are limited and limit states' abilities to reach very small, rural, and disadvantaged communities. These communities are also the communities least likely to know about the availability of SRF funds or other funding resources, know how to go about applying for funding, or who to contact. Often their only contact with state government has been a result of enforcement actions related to non-compliance, and they are reluctant to approach the state for any assistance. Third party, national nonprofit, technical assistance providers can provide this assistance.

S. 1114 includes important revisions to the existing Clean Water Act, and begins the important national debate on how to best protect our clean water resources and provide wastewater treatment. Thank you for this opportunity to testify on behalf of the small communities RCAP represents. We look forward to continuing to work with you on these issues.

October 12, 1993

Mr. Kenneth Bruzelius
 President
 Rural Community Assistance Program
 P.O. Box 81
 New Prague, Minnesota 56071

Dear Mr. Bruzelius:

The Subcommittee appreciates your participation in the hearings of the Subcommittee on Clean Water, Fisheries and Wildlife in its review of the Clean Water Act. In furtherance of our review, we have a few follow-up questions for the record. Please provide your answers to Bill Leary at 505 Hart Senate Office Building, Washington, D.C. 20510 by October 29, 1993.

Senator Kempthorne following June 23, 1993 hearing:

- ✓ 1. On the debate now taking place between the wisdom of providing further assistance under the Clean Water Act in loan or grant form, which do you believe to be the most effective form of assistance?

Does your viewpoint apply equally to large and small communities?

- ✓ 2. I note that Davis-Bacon requirements apply to construction of wastewater treatment facilities and other projects funded through the State Revolving Loan Fund. Data generously suggests that these prevailing wage requirements substantially drive up the cost of projects. At a time when local and state governments are financially strapped and struggling to comply with numerous environmental mandates, wouldn't it make sense to exempt these projects from a requirement that mandates wage payments equal to the highest paid in the area where the project is located, rather than a rate dictated by the competitive market?

**RURAL
COMMUNITY
ASSISTANCE
PROGRAM**

Senator Bob Graham
Chairman
Subcommittee on Clean Water,
Fisheries And Wildlife
United States Senate
Committee on Environment and
Public Works
Washington, DC 20510-8175

Dear Senator Graham:

Mr. Ken Bruzellus, RCAP's President, asked me to respond to your letter of October 12, 1993, regarding follow-up to his testimony on the reauthorization of the Clean Water Act. The questions raised by Senator Kempthorne related to three areas: the need for grants and/or loans, the impact of Davis-Bacon requirements, and the treatment of stormwater as non-point sources of pollution in communities with populations under 100,000.

First, as Mr. Bruzellus stated in his testimony, small communities -- particularly lower-income communities -- have not benefited from the existing state revolving loan funds (SRF) for wastewater facilities because these communities can not afford to repay the loans or pay up front costs necessary to complete the loan application process. Grants and/or other financing mechanisms, like principal subsidies currently used in the SRF program in New York state or negative interest loans, are needed to make necessary system improvements *affordable* for these communities.

Grant funds should be made available to small and/or low-income communities to cover the up front costs related to project planning and design, etc., *whether or not* the community is successful in accessing the SRF. These grants might be reimbursed to the SRF if the community received reimbursement from another source (like RDA) for these costs or might be added to the SRF loan total *where affordability is not affected*.

Criteria for any grants or subsidies under the Clean Water Act should be limited to communities that are small (under 5,000) and/or low-income communities.

802 South King Street
Suite 402
Leesburg, Virginia 22075

703/771-8836
Metro 478-8652
Fax 703/771-8753

Regarding the Davis-Bacon requirements for federal construction programs under the Clean Water Act, Senator Kempthorne is correct when he states that the prevailing wage requirements under this act drive up the cost of projects. This can be a particular problem in small communities where project labor costs can be artificially high due to Davis-Bacon requirements in comparison to local wages and disproportionately increase the overall cost of the project. In small and lower-income communities the "extra" costs of complying with Davis-Bacon often have a negative impact on the affordability of the project and loan.

Finally, while we can not specifically address the applicability of the Coastal Zone Management Act BMPs to other non-coastal zone watershed areas, we strongly encourage watershed protection actions as part of any pollution prevention strategy. Watershed protection activities and plans must be treated as regional, not local, imperatives and small communities within a watershed must be included in any regional watershed planning and protection programs.

Sincerely,

Kathleen M. Stanley
Executive Director

STATEMENT OF PAUL K. MARCHETTI, EXECUTIVE DIRECTOR, PENNSYLVANIA INFRASTRUCTURE INVESTMENT AUTHORITY, HARRISBURG, PENNSYLVANIA

I am Paul Marchetti, Executive Director of the Pennsylvania Infrastructure Investment Authority, commonly referred to as PENNVEST. I appreciate the opportunity to speak with you today about the State Revolving Fund (SRF) program. My testimony will describe the PENNVEST program, which implements the SRF in Pennsylvania, and will also address a number of provisions in S. 1114 that would modify this program, particularly those in Title I.

PENNVEST OVERVIEW

PENNVEST was created by Governor Robert P. Casey in 1988 to address the pressing water quality problems that plagued Pennsylvania at that time. The Commonwealth lead the nation in cases of water-borne disease and a third of our sewer systems were under connection bans or limitations. These conditions were not only environmental concerns but also inhibited economic growth and job creation across the Commonwealth. The Governor saw PENNVEST as a mechanism for addressing both of these issues simultaneously.

PENNVEST was initially capitalized by \$1 billion in funding for both drinking water and wastewater projects. Approximately three fourths of the capacity came from the state, with the balance coming from the federally funded SRF. Much of the state's contribution, and all of the federal contribution, is comprised of revolving funds that are used to make loans whose repayments remain with the PENNVEST program. Thus, we are also able to issue revenue bonds to finance additional projects in the future (\$142.5 million have been issued to date).

Pennsylvania's voters in 1992 added an additional \$350 million in state borrowing capacity to fund more projects. This referendum also expanded PENNVEST's financing authority to include storm water projects.

PENNVEST was created to serve the clean water financing needs of all Pennsylvanians, with a particular emphasis on small systems and rural areas. Pennsylvania has approximately 2,500 community drinking water systems and almost 4,000 wastewater systems. Seventy-five percent of these systems are small (defined as having fewer than 1,000 connections). Taking wastewater systems alone, approximately 70 percent are small. Pennsylvania also has the largest rural population in this country. Of our 67 counties, 55 are considered rural (defined as having a population of 200,000 or fewer).

PENNVEST financial assistance is comprised primarily of low-interest loans, although a small amount (five percent) is comprised of grants funded by state appropriations. The interest rates on our loans range from a minimum of 1.0 percent up to a maximum of four to five percent, depending upon prevailing market interest rates. We average about 2.2 percent. For any individual project, we can provide up to \$250,000 in state funded grants. However, we never allow grants to constitute more than 50 percent of our assistance to a project. We will also extend the term of our loans to 30 years in cases where even a 1.0 percent loan and a maximum grant is not enough to make a project reasonably affordable. We can, of course, only do this with state funds.

The interest rate that we charge a borrower, as well as the amount of grant funding, if any, that we provide, is determined by a comparison between the costs of a project and the financial capability of the project's users to pay for it. Smaller, more economically disadvantaged communities will receive proportionally larger interest rate and grant subsidies than will other borrowers, simply because the typical water or sewer project is large and expensive relative to the user base available to repay our loan.

Since its inception in 1988, PENNVEST has provided \$1.2 billion in funding to 688 drinking water (325) and wastewater (363) projects across the Commonwealth. Of these funds, \$344 million (29 percent) have gone to small systems. These systems have also received 75 percent of our grant funds. From a slightly different perspective, approximately 50 percent of our assistance has gone to rural areas. This is not to say that urban areas have been neglected by this program either. For example, we have made a \$20 million loan offer to the City of Philadelphia. Other urban areas in the Commonwealth have received similarly large loans from PENNVEST. In addition to the environmental benefits that PENNVEST has created across the Commonwealth, the program has also helped create over 13,000 permanent jobs in this state, in addition to approximately 41,000 direct construction jobs.

Looking only at the SRF portion of the PENNVEST program, we have approved 86 SFR loans since December of 1988, for total funding of \$189 million. Of these, 52 loans are closed and the projects are under construction. We have disbursed \$81 million in funds to date for these projects. Seven of our SRF loans are amortized and their repayments, along with those paying interest only, provide PENNVEST with approximately \$84 million in SRF income every month.

COMMENTS ON S. 1114

I would now like to offer some comments on specific provisions contained in S. 1114. These comments will focus on the funding provisions of the bill and will also include one suggestion for an additional provision that I think would improve the SRF mechanism. Let me preface these comments, however, by saying that I believe that the SRF program as it is currently structured has been enormously successful, both in Pennsylvania as well as in states all across the country. I am pleased to see that S. 1114 continues the fundamental, loan-based program that has worked so well to date.

Funding Levels: Section 101(h)

S. 1114 continues SFR funding through FY 2000 at an annual funding level of \$2.5 billion, with the possibility of additional funding if federal deficit reduction goals are met. I am grateful for this continued financial support for the SRF program. It is much needed in Pennsylvania, as I am sure it is in other states. Our wastewater funding needs are estimated to be over \$3 billion (in 1990 dollars). Our needs for combined sewer overflow (CSO) projects alone are \$1.9 billion. With the proposed baseline funding of \$2.5 billion annually, Pennsylvania would receive a total of approximately \$1 billion in federal financial assistance from FY 1989 through FY 2000 under the present allocation formula.

We could obviously use even more funding than that envisioned by S. 1114, and I urge committee members to find as much additional funding for wastewater projects as possible. I understand the motivation for tying additional funding to deficit reduction goals but hope that this restriction might be loosened, if not eliminated, so that communities across the country, particularly smaller and poorer communities, can receive the financial assistance they need to comply with federal water quality standards.

Loan Principal Forgiveness: Section 101(d)

In cases where even a zero interest loan will result in user rates that are excessive relative to project users' ability to pay, states should be able to write-down a portion of the SRF loan principal as a grant. It is appropriate that S. 1114 recognizes this need and provides states with the flexibility to do this. It is also appropriate that the use of principal forgiveness is constrained by limiting it to a percentage of the federal capitalization grant. I am pleased to see that the use of this mechanism is tied to users' ability to pay, which, in my opinion, is the only relevant criterion for sacrificing fund capacity to make loans more affordable through principal forgiveness.

In Pennsylvania, we use grants only if the effect on a system's user rate meets some threshold minimum dollar reduction from what the user rate would be without the grant. We do this in order to avoid using scarce grant resources in cases where they will have limited financial impact. The committee may want to consider a similar limitation for principal forgiveness. Aside from this possibility, however, I encourage the committee to maintain the flexibility that S. 1114 provides the states in using this mechanism.

Land Cost Eligibility: Section 101(a)(2)

When funding a wastewater project with state funds, PENNVEST allows land costs to be included as an eligible item for funding. This is also true for drinking water projects. I agree with the provision of S. 1114 that would make necessary land, easements, and rights-of-way costs eligible for funding under the SRF.

Technical Assistance Funding: Section 101(c)

Providing technical assistance to small communities on management and financial matters is important to the financial health of the SRF program. I agree with the provision in S. 1114 that allows states to use a portion of their state matching funds, up to 2 percent of the federal capitalization grant amount, to provide such assistance.

Leveraging: Section 101(g)

I do not agree with the requirement contained in S. 1114 that all states must leverage some portion of their SRF funds. In Pennsylvania we leverage the funds in our state program, having issued \$142.5 million in revenue bonds to date. We also intend to leverage our SRF funds as funding needs arise. Our experience and needs are not necessarily the same as those in other states, however, and this state-to-state variability should be recognized in this legislation.

While leveraging may allow projects to be funded sooner than they would be otherwise, it does not increase the total amount of funding that will ultimately be available from the SRF. Some states may need more funding now than they anticipate needing in the future, while the reverse may be true of other states. While it is probably true that the funding needs of all states exceed the financial resources available in the SRF program, some states may prefer to conserve their available resources for the future rather than expend them on project funding now. The timing of funding through decisions about leveraging is, in my opinion, better left to the states to determine. Requiring a minimum amount of leveraging from all states eliminates flexibility that I would prefer to see retained in the SRF program.

Extended Loan Payback

An additional provision that I recommend the committee consider for inclusion in S. 1114 would allow states to extend loan payback periods beyond the presently authorized 20 years. In cases where the user rate that will result from a SRF project is higher than what is reasonably affordable, states should be allowed to extend the term of their SRF loans. In PENNVEST, we will go out as far as 30 years. I suggest that as a reasonable maximum although, again, the needs of other states may differ. A reasonable standard for the loan term maximum is the design life of the facility being built. Whatever maximum term is chosen, this allowance for some extension beyond the current limit of 20 years would help ease the financial burden facing small and economically disadvantaged system users.

This concludes my testimony. I want to thank the subcommittee for the opportunity to appear here today and I would be glad to address any questions that you might have.

Executive Director

October 28, 1993

Bill Leary
505 Hart Senate Office Building
Washington, D.C. 20510

Dear Mr. Leary:

I am writing in response to an October 12, letter addressed to me by Senator Bob Graham, as Chairman of the Subcommittee on Clean Water, Fisheries and Wildlife, Committee on Environment and Public Works. That letter transmitted three questions raised by Senator Kempthorne following hearings on S.1114 in which I was a participant. The questions, and my responses, are as follows.

Q #1. On the debate now taking place between the wisdom of providing further assistance under the Clean Water Act in loan or grant form, which do you believe to be the most effective form of assistance?

Does your viewpoint apply equally to large and small communities?

A #1 There is no doubt in my mind that loans provide the most effective form of assistance for the construction of infrastructure projects. It is vitally important that the recipients of public assistance be provided with the correct incentives to economize on both the design and use of the facilities constructed with this assistance. The greater the financial stake that the recipient has in the design and operation of a facility, the more efficient will be the facility's design and the more effective will be its operation.

That having been said, I recognize that there are circumstances where even low, or zero, interest loans may pose a difficulty for a community to repay, particularly when the user base is small relative to the size of the facility that must be constructed. In such situations it is appropriate that grant assistance be combined with low interest loan assistance in order to make the project affordable to users. This is both equitable and sound

loan financing, since easing the burden of repayment with grant funds will improve the chances of repayment of loan funds.

The critical point in the application of grant funds to infrastructure financing is that they must always be provided in conjunction with loan funds. In order to maintain the efficiency incentives of loan-based financing, some repayment must always be expected of the recipients of financial assistance. This repayment should be tied as closely as possible to the users' ability to pay for the services provided. Grant funds are appropriate for closing the gap between this affordable payment and the costs actually needed to construct the facility. It is vitally important to the effective administration of financial assistance that this combining of loan and grant funds be accomplished by a single financing entity, such as a State Revolving Loan Fund.

These observations apply equally to large and small communities, although it is likely that the mix of loan and grant funds will differ by the size of the community, with small communities being in greater need of grant funds to offset relatively higher project costs and resulting user rates.

Q #2

I note that Davis-Bacon requirements apply to construction of wastewater treatment facilities and other projects funded through the State Revolving Loan Fund. Data generously suggests that these prevailing wage requirements substantially drive up the costs of projects. At a time when local and state governments are financially strapped and struggling to comply with numerous environmental mandates, wouldn't it make sense to exempt these projects from a requirement that mandates wage payments equal to the highest paid in the area where the project is located, rather than a rate dictated by the competitive market?

A #2

If local labor markets are truly competitive, which I have no reason to disbelieve, then there will be little or no difference between the "highest paid" wage rate in the area and any other rate. Consequently, the effect of Davis-Bacon requirements should, at least on this argument, be rather small.

Taking a broader view, however, I certainly cannot disagree with the general premise that reducing unnecessary costs involved in designing and constructing wastewater treatment plants would help State Revolving Loan Funds (SRF's) to stretch their scarce dollars to

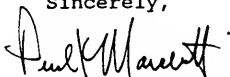

meet a larger amount of environmental and public health needs. All of the Title II requirements involved in financing such projects with SRF monies should be subject to a critical review of their need and effectiveness relative to the costs that they impose on the projects being funded.

Q #3 I understand that S.1114 would allow communities under 100,000 to treat their stormwater outflows as non-point sources of pollution and that where those communities are located in an impaired watershed, a non-point sources best management practices plan would have to be in effect. The model proposed for that plan is that contained in the Coastal Zone Management Act. Could you address the general applicability of the Coastal Zone Management BMP's to other regions of the country with vastly different geography, climate, and hydrology?

A #3 In a word, no. PENNVEST is strictly a funding agency, which causes us to concentrate on the financing aspects of the SRF program. The technical nature of the question you raise, and particularly the broad scope of the applicability of the issue, lies considerably outside my, or my agency's, area of expertise. I can refer you, however, to Caren Glotfelty in Pennsylvania's Department of Environmental Resources (717-787-4686). As the Deputy Secretary for all water programs in the Department's jurisdiction, Ms. Glotfelty is well versed in the issues you raise and could provide a thoughtful and informative answer.

I hope that my responses have been of some assistance to you. If you have any additional questions on the SRF program, please do not hesitate to contact me.

Sincerely,

Paul K. Marchetti
Executive Director

TESTIMONY OF RONALD J. MARINO, VICE PRESIDENT, PUBLIC FINANCE
DIVISION, SMITH BARNEY, HARRIS, UPHAM & CO., INC.

Mr. Chairman and Members of the Committee:

My name is Ronald Marino, Vice President in the Public Finance Division of Smith Barney, Harris Upham & Co., Incorporated. I am here today to represent the Public Securities Association as the Committee reviews the accomplishments of State Revolving Loan Funds (SRLF) for wastewater treatment and facilities and undertakes legislative recommendations for the continuation of the program to 2000. PSA is the international trade organization of banks and securities firms engaged in the markets for municipal securities, U.S. governments and federal agency securities, mortgage backed securities and money market instruments.

While Federal financial assistance has been available to assist localities to build wastewater treatment facilities since the 1950's, it is the passage of the Clean Water Act in 1972 that established national standards for pollution control and authorized an \$18 billion grant program to assist states and localities to meet these new Federal mandates. In 1987 when the Clean Water Act was being reviewed for reauthorization there was increasing concern and criticism of the grant program by the Congress. With policy foresight to limit the increasing Federal role and to create a flexible financing mechanism for the states, Congress authorized a State Revolving Loan Fund Program as the mechanism to leverage ever scarcer Federal resources.

While our infrastructure funding deficiency was clear in 1987 and still is today, Congress and the capital markets have made significant steps to start closing that gap. In 1987, the nation's wastewater treatment needs were estimated to exceed \$83.5 billion. Congress authorized \$8.4 billion to capitalize the SRLF's to 1994. All 50 states have undertaken the required legal and financial operational steps to implement the program. A year old survey by the Council of Infrastructure Financing Authorities indicated that, at that time, the States had received almost \$6 billion of Federal capital grants which were leveraged with \$1.4 billion to create a loan pool of \$10.7 billion. This leveraging factor will begin to increase as loan repayments continue and grow over time.

Various studies including EPA's "State Revolving Fund Find Report to Congress" indicate that the dynamic structure of SRLF can provide project funds of between 2.0 to 4.0 times the initial assets. An added benefit can be the loan pool itself. If the loan pool is carefully administered, an SRLF can provide sufficient revenue generation to provide an "internalized" means of credit support, promoting an investment-grade credit rating through the structure of the loan pool without having to rely on state guarantees.

SRLF's are not a bizarre new technology. Their purpose and goal can be best understood within the context of the declining level of Federal aid and the competition between the capital and expense side of the budgets of state, county and municipal government. Their fundamental principal is that SRLF's can provide a steady, stable source of capital dedicated to environmental facilities which will be:

- a reliable long-term financing mechanism which continually generates more capital as more loans are made;
- a structure to facilitate and accelerate the lending of Federal funds;
- a vehicle to make unfeasible or risky projects feasible while investing less public sector funds and thereby expand the overall number of loans and projects;
- and a more self-sufficient financing and efficient decision making process.

Projecting the continuation of the SRLF program, Mr. Chairman, I am aware that the Committee has a concern to make the program more efficient and to increase the velocity of the loans being made and loans being repaid. Of course, your goal is to make loan repayments available sooner for additional loans.

One proposal is to allow or encourage the SRLF to concentrate on construction financing and delegate to the localities the responsibility to secure permanent financing directly from the capital markets or through a state authorized entity. I believe that there is no statutory prohibition to a state creating such a construction loan program under the current law. The existing law provides states with the flexibility to establish varied loan terms including maturities up to 20 years. A state can set loan terms to provide for a construction loan program or decrease the loan repayment term to a period of less than 20 years. While a shorter loan term will increase loan velocity, there would be a negative impact on less affluent counties and municipalities and for those localities whose credit rating will make it difficult or very costly to rely upon the capital markets for an unsubsidized permanent loan. The main goal of the SRLF is to encourage counties and municipalities to construct and/or upgrade existing facilities. The program should retain the flexibility to

permit various loan structures and terms to be offered by each state to the participants based upon the funding needs and revenue resources. The greatest legislative emphasis should be placed upon the Congress' interest in encouraging states to leverage the federal contribution to the maximum level possible. Some states have been more aggressive than others in creatively enlarging the size of their program. Setting some minimum leverage ratio as a goal for program-wide activities is one clear method. Being cognizant and sensitive to the balance between a locality's ability to repay the loan and motivating that same locality to participate should be an underlying principle in setting any leveraging standards. While the Federal government should be involved with the development of the programmatic standards and regulatory framework, the Congress also should promote some discretion and tractability for each state to produce a program that can be successful within the local legal and financial framework.

The most popular and successful structure for leveraging is produced when a state reserves all or a portion of the Federal contribution as a reserve supporting a state debt issue. The proceeds of the issue can leverage the size of the reserve anywhere from two to four times. The reserve acts as a form of credit enhancement, allowing for a higher credit rating and reducing financing costs to the borrowers, the counties and municipalities who are the ultimate borrowers.

A significant limitation that restrains the ability of this structure to maximize the leveraging is the restriction on the investment of the reserve funds. Generally, the reserve fund must be treated as bond proceeds for the purpose of investment yield under the arbitrage rules in Section 148 of the Internal Revenue Code. While the reserve funds do not result from the proceeds of or issuance of debt, states must restrict the yield that these reserves earn. Easing the restrictions on the investment of reserve funds will be a strong incentive to leverage.

There are several other recommendations, some based on the 1992 General Accounting Office study of revolving loan funds, which should be considered by the Committee. Among these are the following:

- Permitting principal subsidies for low income localities that have a difficulty in repaying even zero-interest loans;
- Permitting the SRLF to be used for acquisition of the sites for facilities and a small percentage to be used for administrative costs;
- Reducing the vestiges of the former grant program's mandates for a number of Federal rules and regulations.

Again, I thank you Mr. Chairman and Members of the Committee for the opportunity to discuss these important environmental infrastructure concerns. We appreciate your leadership on these issues.

Dear Mr. Marino:

The Subcommittee appreciates your participation in the hearings of the Subcommittee on Clean Water, Fisheries and Wildlife in its review of the Clean Water Act. In furtherance of our review, we have a few follow-up questions for the record. Please provide your answers to Bill Leary at 505 Hart Senate Office Building, Washington, D.C. 20510 by October 29, 1993.

Senator Kempthorne following June 23, 1993 hearing:

- ✓ 1. On the debate now taking place between the wisdom of providing further assistance under the Clean Water Act in loan or grant form, which do you believe to be the most effective form of assistance?

Does your viewpoint apply equally to large and small communities?

- ✓ 2. I note that Davis-Bacon requirements apply to construction of wastewater treatment facilities and other projects funded through the State Revolving Loan Fund. Data generously suggests that these prevailing wage requirements substantially drive up the cost of projects. At a time when local and state governments are financially strapped and struggling to comply with numerous environmental mandates, wouldn't it make sense to exempt these projects from a requirement that mandates wage payments equal to the highest paid in the area where the project is located, rather than a rate dictated by the competitive market?

SMITH BARNEY SHEARSON

October 28, 1993

Senator Bob Graham
United States Senate
Committee on Environment and Public Works
Washington, DC 20510-6175

Dear Senator Graham:

I am pleased that you have contacted me on behalf of the Subcommittee to elicit my views on the reauthorization of the Clean Water Act.

I am answering Questions 1 and 2, but I am not responding to Question 3 since I do not have any background or experience in stormwater treatment of outflows.

Question 1

The provision of further financial assistance by the Federal government should continue in the form of loans due to the lack of available resources. The restricted nature of the Federal budget precludes the possibility of any additional resources being directed to Clean Water programs. Thus, the existing funds should be leveraged to the greatest feasible level. The revolving loan fund process permits the possibility of aggressive leveraging to take place. My opinion applies to both large and small communities.

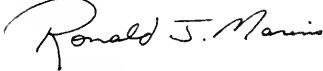

The subcommittee might consider distinguishing between poorer and more affluent communities for the level of subsidy that a state can provide.

Question 2

I would generally agree with the direction of the Question concerning Davis-Bacon requirements. State wage regulations or competitive wage rates should be permitted to apply.

I thank you again for this opportunity.

Sincerely,

Ronald J. Marino
Vice President

REAUTHORIZATION OF THE CLEAN WATER ACT

THURSDAY, JULY 1, 1993

U.S. SENATE,
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,
SUBCOMMITTEE ON CLEAN WATER, FISHERIES, AND WILDLIFE,
Washington, DC.

TOXIC POLLUTION: PREVENTION AND CONTROL

The subcommittee met, pursuant to notice, at 9:38 a.m. in room 406, Dirksen Senate Office Building, Hon. Bob Graham [chairman of the subcommittee] presiding.

Present: Senators Graham, Lieberman, Chafee, Faircloth, Kempthorne, and Baucus.

OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

Senator GRAHAM. I will call the meeting to order.

This is a meeting of the subcommittee on Clean Water, Fisheries, and Wildlife of the Senate Committee on Environment and Public Works. As you can see, we are using a different format today, one which I hope will generate a level of discussion and understanding of these complex and vexing issues. This is one of a series of hearings that we are holding as part of the reauthorization of the Clean Water Act. Today we are going to be focusing on the issue of toxic pollution prevention and control.

At this hearing, we anticipate that we'll have some genuine disagreement and differences of opinion on important issues. Just in the past few days, for example, U.S. PIRG released a report, using EPA data, which reveals that industrial discharges of toxics into our waters totaled 654 million pounds in 1991, 63 percent of which was released to sewers. This is obviously in contradiction to the original goal of the Clean Water Act that discharge of toxic chemicals be prohibited. We are also told that some of these substances pose so serious a threat to human and environmental health even in small amounts that they must be prohibited.

On the other hand, we've been told repeatedly that the Clean Water Act has worked and is working to reduce the impact of toxic substances on our waters, that toxic substances represent but 10 percent of the remaining pollution problem. One of our witnesses has even likened some of the bill before us to central control policies practiced in Eastern Europe and the former Soviet Union. This is illustrative of the degree of disagreement that exists on the facts and the implications of those facts. It's our hope that in this more informal setting we will be able to narrow the differences.

We have before us a list of difficult issues about which we will hear disagreement. They range from pollution prevention planning to banning certain toxic substances. They include efforts to improve water quality criteria from which the States set water quality standards. They include efforts to develop criteria for sediment quality and to improve the pre-treatment of toxic waste discharge at treatment facilities ill-equipped to handle it.

I want to work off the agenda that you have received, which indicates a series of subissues under the topic of toxic pollution. We have panels of generally four persons per subissue. It is my expectation that we will move directly toward a discussion of these issues. I would ask that those of you who have prepared statements, if you would submit those, and they will be entered in the record.

We are joined today by the Chair of the committee on Environment and Public Works, Senator Max Baucus.

Senator Baucus, do you have an opening statement?

**OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR
FROM THE STATE OF MONTANA**

Senator BAUCUS. Thank you very much, Mr. Chairman. I first want to commend you for your very diligent work. It's obvious that you devote a lot of time and attention to getting this bill through the subcommittee so that the full committee can take it up. As you well know, the Clean Water Act reauthorization is our committee's top priority, and we hope to get the bill reported out this year and on the floor of the Senate.

Mr. Chairman, today's hearing, as you've stated, is particularly challenging. It's about controlling the discharge of toxic pollutants, not an easy subject. For the past 20 years, this has been one of the major goals of the Clean Water Act, and I think it's fair to say that we've made a lot of progress. We've implemented technology-based standards for major industries. We've worked with States to develop water quality standards, and in 1987 we began a toxic hot spot program, which I think has been quite effective.

Some people now say that because of this progress, the committee should turn its Clean Water Act attention elsewhere—for example, to controlling conventional pollutants and diffuse or non-point sources. I agree that we need to do more regarding conventional pollutants as well as non-point pollution. There's a major section in the bill that Senator Chafee and I introduced dealing with non-point. But I do not believe that we should, therefore, slack off on toxics, because it is clear that despite our progress, there is a lot yet to be done.

For example, as you've stated, in 1991—your figure is 654 million pounds; my staff says it's 656 million pounds, give or take two millions pounds—of toxic pollutants were discharged by major industries into the waters of our country. This figure includes only major facilities required to report under the toxic release inventory and does not include all toxic water pollutants. The EPA reported that in 1990 toxic metals and pesticides cause impairment of about 50,000 rivers and stream miles, and this figure is based on reports

from only 41 States, which assessed an average of only half of their waters.

There's growing scientific evidence that toxic water pollution is a significant threat to aquatic species, to wildlife, and to humans. Scientists working in the Great Lakes area found tumors in fish, birth deformities in some species of birds, snapping turtles with deformed legs and twisted mouths. In reviewing these findings, the International Joint Commission on the Great Lakes recently concluded,

When available data on fish, birds, reptiles, and small mammals are considered along with the human research, the Commission must conclude that there is a threat to the health of our children emanating from our exposure to persistent toxic substances, even at very low ambient levels.

The effects of toxic pollutants are not confined to the Great Lakes. Scientists at a 1991 meeting in Racine, Wisconsin, issued a consensus report which stated,

A large number of manmade chemicals that have been released into the environment have the potential to disrupt the endocrine system of animals, including humans. Among these are the persistent biocumulative compounds that include some pesticides and other chemicals in metals.

The scientists went on to conclude,

Unless the environmental load of synthetic hormone disrupters is abated and controlled, large-scale dysfunction at the population level is possible. The scope and potential hazard to wildlife and humans are great because of the probability of repeated and/or constant exposure to numerous synthetic chemicals known to be endocrine disrupters.

I know that some of the toxic control provisions of S. 1114 are controversial. The bill proposes some major changes—that is, consideration of in-plant process changes as a way to control pollution, phase-out of the most toxic and persistent pollutants, a new initiative for pollution prevention planning, and tightening the Water Quality Standards Program. As we discuss these provisions, we need to remember that the long-term health and the vitality of aquatic species and wildlife, and even humans, may well depend on our success in controlling toxics.

Thank you, Mr. Chairman.

Senator GRAHAM. Thank you, Mr. Chairman.

The first issue that we will discuss today will be pollution prevention, and I would like to ask if the panelists for that portion of the agenda would please come forward: Mr. Nikki Roy of the Environmental Defense Fund; Anita Dawson, Manager of Environmental Affairs, American Cyanamid Company, representing the Chemical Manufacturers Association; Bruce Baker, Association of State and Interstate Water Control Agencies; and Martha Prothro, Acting Assistant Administrator for Water at the EPA.

As I indicated, it is our request that any opening statement that you have been filed. I would like to make a short stage-setting statement for this portion of our discussion and then ask if each of you would like to make a brief statement, and then we'll proceed to questions and, I hope, interchange among the members of the panel.

Ever since the Clean Water Act was enacted, its focus has been on efforts to control and clean up pollution, with particular attention to toxic pollution. While we have seen statements of success from the act, many believe the remaining problems are going to

take more than an end-of-the-pipe solution. They favor reducing or preventing pollution in the first place. One important benefit of this approach is stated to be that it can prevent the transfer of pollution away from water into another medium, such as air.

Industry says that pollution prevention should be voluntary and flexible and that it is already being practiced. Industry also is concerned about having EPA become involved in manufacturing processes. The environmental community believes that industry must still be prodded into pollution prevention planning and that the public should have access to a summary of those plans.

The legislation that Senator Baucus referred to directs EPA to identify not less than 20 pollutants for which discharge reduction would benefit human health or the environment. Dischargers of such pollutants are then required to develop pollution prevention plans sufficient to cover at least 80 percent of the discharge of each of the listed pollutants. Among the issues we need to address are, do we need to mandate pollution prevention planning, and if we do, should EPA decide who should have to do it?

With that introductory statement, I'd like to first call on Mr. Roy for a brief response to the issue of pollution prevention planning.

STATEMENT OF MANIK ROY, POLLUTION PREVENTION SPECIALIST, ENVIRONMENTAL DEFENSE FUND, WASHINGTON, D.C.

Mr. Roy. First, thank you, Mr. Chairman. It's exciting to be talking about pollution prevention in the context of one of our mainstream environmental laws. I worked on pollution prevention for several years first for the State of Massachusetts, then for EPA, before coming to the Environmental Defense Fund, and for a long time the issue has been sort of an add-on to our existing laws. I think this discussion of pollution prevention in the Clean Water Act is a first.

The issue of pollution prevention planning, to me, is a matter of giving the responsibility to industry of investigating their pollution prevention options and choosing those that make the most sense. The way we set environmental standards in this country, we ask EPA to figure out what constitutes an industry segment and then to decide what pollution control technologies apply to that entire industry segment. By definition, through that approach, we can't develop standards that require specific companies to wring the most efficiency out of their production processes.

Pollution prevention planning such as the type that's in S. 1114, and is in your bill, Senator Lieberman, and has shown up in various States across the country basically puts back to companies the responsibility of analyzing what options for pollution prevention exist within their facility and then asks them to carry those out. Also you were saying in your statement that industry asks for it to be flexible. I think it's extremely flexible in that industry comes up with the right answer, but there is a responsibility that would be formalized through such a planning provision.

Thank you.

Senator GRAHAM. Thank you, Mr. Roy.

I want to express my apology to Senator Lieberman. He came in so stealthily that I did not realize he had joined us.

Senator, did you have an opening statement? I know that you have introduced legislation precisely on the subject that we are now discussing.

Senator LIEBERMAN. Thank you, Mr. Chairman. Since you and I both joined the Armed Services Committee, we've both been more stealthy.

I look forward to the dialog. I'm a strong supporter of pollution prevention planning and have introduced legislation on the subject, and I'm grateful that Senator Baucus and Senator Chafee included this title in S. 1114, and I look forward to the discussion. Thank you.

Senator GRAHAM. Thank you.

Mr. Baker?

STATEMENT OF BRUCE BAKER, DIRECTOR, WATER RESOURCES MANAGEMENT, WISCONSIN DEPARTMENT OF NATURAL RESOURCES, REPRESENTING THE ASSOCIATION OF STATE AND INTERSTATE WATER POLLUTION CONTROL ADMINISTRATORS, WASHINGTON, D.C.

Mr. BAKER. Thank you. First of all, let me say that I'm a strong supporter of pollution prevention. I think the States—in the last 10 years, it is one of the areas that there has been more and more emphasis and initiatives has been in the area of pollution prevention. One of the things we've learned is that we're basically running out of answers with conventional control technologies. There are only so many end-of-the-pipe solutions that are out there, and we're finding to deal with some of the more difficult problems that you have to go to pollution prevention. In addition, it's the cost effective way to deal with the issue.

So I think it's a great move to put this in the Clean Water Act. I think it should be featured in the Clean Water Act. I think the discussion we need to have is exactly how we accomplish it. One of the concerns that I have is if we tie this to permits, we're concerned about the continuing workload and the complexity of getting out municipal permits and industrial permits. There's already a backlog in the majority of States, and I'm concerned about adding to the difficulty of issuing those permits by tying the entire pollution prevention program to that. So I think one of the things to look at and think about is, are there other ways to do this so that it doesn't result in complexity in the permit program?

Another thing to think about and a concern we have is making sure that pollution prevention is done in a comprehensive fashion. I know you're dealing with the Clean Water Act, but pollution prevention plans, from our experience, need to be comprehensive. They need to deal with all media. It does not make sense to concentrate just on the water stream, and more effort needs to be placed on a comprehensive approach to pollution prevention so that we clearly solve the problem and not just move it to another medium.

Also, in doing pollution prevention, our experience has been that some of the greatest successes we've had have been where we've given the industry the charge to do a pollution prevention plan, but we've not prescribed to them exactly how to do it. We've not prescribed which pollutants necessarily. We may suggest that these

are the ones to look at. I'm a little bit concerned about some of the provisions in here which may cause a mindset among some industries to only look at what's required as opposed to going in and doing a comprehensive review of their facility. They really are the ones in those facilities that understand what they're using in terms of products and raw materials, and I think what we want to do is to be careful not to limit their thinking in doing pollution prevention planning.

So I would ask that some thought be given to making sure that we don't get them to look at goals or to look at only certain pollutants which may really result in less aggressive pollution prevention than we've seen in some industries. Some industries where we might have said, "Hey, we'd like to see an 80 percent reduction of pollutant 'X'," have come back and totally eliminated that pollutant from their stream by coming up with innovative solutions.

Other than that—and I think those are sort of how-to issues—I think the direction, I think the emphasis on pollution planning is exactly where we need to go.

Senator GRAHAM. Thank you very much.

Ms. Dawson?

STATEMENT OF ANITA DAWSON, MANAGER, ENVIRONMENTAL AFFAIRS, AMERICAN CYANAMID COMPANY, REPRESENTING THE CHEMICAL MANUFACTURERS ASSOCIATION, WASHINGTON, D.C.

Ms. DAWSON. Thank you, Mr. Chairman.

I'd like to add to the comments that have already been made, and, surprisingly, we all agree on this. Pollution prevention is clearly the way to gain more headway in this field. As you know and had indicated, CMA fully supports voluntary pollution prevention planning. We agree with Mr. Baker that it should be multimedia, not focused on a single medium, and we support the hierarchy of pollution prevention planning, looking first to source reduction and to recycle/reuse and to use treatment where that's appropriate and there are no other alternatives.

We agree that facility-specific plans are a must because of the specificity of our production processes and the raw materials that we use, and we believe as well that the facilities should prioritize the pollutants for reduction and that they should do that not only specific to their site conditions, but also with risk reduction as the primary goal so that the chemicals that they use that are most likely to adversely impact the environment or human health are addressed first.

There are some provisions in the Senate bill that do not coincide with the approach that we would take and that we see as the most effective. We feel the single-medium approach can be a problem in perpetuating the release to other media while working on the water side. The list of 20 pollutants would not necessarily get as much reduction as we could get with individual facilities looking at their pollutants and prioritizing the highest risk for their facilities.

We are concerned, as is Mr. Baker, about the proposed plans being a condition of a permit. That would give the EPA and the States more leverage than we would like to see where we're look-

ing at a voluntary program and voluntary goal setting. In past programs, we've seen goals turning into mandates.

The provisions also do not account for the pollution prevention activities that have gone on by our facilities already, and we feel there should be some recognition of that. There may be some areas where we've already made significant reductions and cannot go too much farther. Specifically, if you look to the TRI data for the CMA member companies from 1987 to 1991, we see a reduction in releases to water of 78 percent.

Our final concern on the pollution prevention planning is about the confidentiality of the information. Our processes are our livelihood and the livelihood of our companies, and we must maintain confidentiality on those issues.

Thank you, Mr. Chairman.

Senator GRAHAM. Thank you very much, Ms. Dawson.

Ms. Prothro?

STATEMENT OF MARTHA G. PROTHRO, ACTING ASSISTANT ADMINISTRATOR, OFFICE OF WATER, ENVIRONMENTAL PROTECTION AGENCY

Ms. PROTHRO. Thank you, Senator. Among EPA's four or so highest priorities for the Clean Water Act is improvement in our ability to deal with pollution prevention as a way to achieve water quality. EPA fully endorses this approach. We like the idea of facility-specific planning we and completely support that. We think a lot of flexibility is needed in how that's done. We think that industry knows a lot about how to go about pollution prevention planning, and if we can get them to undertake it and move toward it, we can achieve a lot.

I certainly agree with some of the other witnesses that multimedia pollution prevention planning is the way to go, but we support starting here with the Water Program. We think it's very important that we have some authority to address in-plant waste streams. I know this is controversial, but we think this is extremely important. We believe we may have the authority now, but as you undoubtedly know, we are challenged on every effluent guideline that we issue. We have to litigate.

We think that if we're going to deal adequately with some of the more complex facilities, where pollutants in the waste stream can be very much diluted at the end of the pipe, we have to have some authority to regulate in-stream in order to ensure that we're moving toward pollution prevention inside the plant. We believe that effluent guidelines generally could benefit. We may also be able to reduce some of the troublesome litigation that we have if we have an endorsement for the pollution prevention approach to controlling toxic pollutants.

Senator GRAHAM. Thank you, Ms. Prothro.

We've been joined by the ranking Member, Senator Chafee, and also Senator Kempthorne and Senator Faircloth.

If you have any opening statements, we'd appreciate receiving them.

Senator CHAFEE. Well, thank you, Mr. Chairman. This is an interesting format here. This is what we call a level playing field, I guess.

[Laughter.]

Senator CHAFEE. I apologize for being late, and worse than that, I have to leave at about 10:30. I don't have a statement and I commend you for this hearing set-up you're trying here.

Senator KEMPTHORNE. Mr. Chairman, I simply look forward to participating in this round-table discussion. Thank you.

Senator FAIRCLOTH. Thank you. Mr. Chairman, just a question. Is this the bill that allows going into plants for inspection purposes?

Senator GRAHAM. That is a provision.

Senator BAUCUS, would you like to respond to the question of what is in the legislation? Also, Senator Lieberman has another legislative proposal on prevention planning.

Senator BAUCUS. Well, essentially, with respect to the 20 most toxic pollutants, a facility must develop a plan to attempt to reduce those 20 toxics to below what the plant would otherwise produce under the technical guidelines as well as the water quality guidelines, effluent guidelines as well as water quality standards. That plan, though, was voluntary. You must develop a plan, but the provisions of the plan are voluntary. That is, a facility can put in its plan whatever it wants to put in it. If it wants to dramatically reduce the discharge from those 20 toxics, if that plant has any or several of those 20 toxics, it may do so. But if it wants to just remedially decrease the amount of toxics that it discharges, the company may do it.

So the amount that it reduces the 20 toxics that are named is entirely voluntary. It's up to the facility. But that plan is publicized, it's public, so that the public knows or the community or the State or the world knows the degree to which that facility is attempting to proceed further. That's essentially it. So there's a mandatory provision and there's a voluntary provision.

Senator FAIRCLOTH. There's no mandatory provision to it?

Senator BAUCUS. The only mandatory provision is, first—I believe this is in the bill—the EPA must identify the 20 most heinous toxics, and a second matter to our provision is that a facility that gets a permit must, as a condition of that permit, include a plan which reduces further any or all of the named 20 toxics that are provided for by EPA. But the voluntary nature of the plan is that the plan may be as ambitious as the company wants to be. There's no specific part of the plan that the company must reduce its toxics by "X" percent or whatnot. That's entirely voluntary. It's entirely up to the company.

Senator GRAHAM. If I could use that last statement of our Chairman as the commencement of questions, a fundamental issue here is, is Government involvement required in order to achieve pollution prevention, or is there enough incentive within the economics of the private sector to lead to voluntary efforts at pollution prevention?

Ms. Dawson, from the perspective of the CMA, you alluded to the efforts that have already been under way. Do you think they are sufficient in and of themselves? Is any Government role required,

and if so, do you have some thoughts as to an alternative Government role to the one suggested in the legislation?

Ms. DAWSON. Yes, we do, Mr. Chairman. Two issues. Let me first address the question of the Government role and the legislation role. There are barriers right now in the Clean Water Act to pollution prevention in some cases. We feel the first role is to remove those barriers, and I'll review those, and that the second role is to provide more incentives.

Clearly, the major industries and the larger companies know and, as you yourself have recognized, there is money to be saved, there is production to increase, and there's product quality to improve through many of these changes. However, the changes are not simply made. They are complex, they take time, and they take effort, and we believe that the argument that we often hear is that, "Well, yes, some of the larger companies are developing pollution prevention plans," but others should as well, and we firmly believe that there should be more incentives to companies to develop these plans that protect our environment even further than we do already under the existing programs.

Some suggestions of the type of incentives that could help would be market incentives, such as tax credits or accelerated depreciation schedules, streamlined permitting or monitoring requirements, perhaps a longer-term permit for companies that are actively working in pollution prevention—rather than a five-year permit term, a 10-year permit term to allow more effort to be focused on pollution prevention planning than the permitting process itself—alternative compliance strategies to allow the facilities the time to implement, and that goes back to the question of barriers, Mr. Chairman. Right now the anti-backsliding provisions of the act create some difficulties in replacing chemicals. When we change one chemical for another, we have a new discharge that may increase the amount of a chemical, and anti-backsliding doesn't allow us to do that. The anti-degradation requirements also impose restrictions on any increases in discharge.

Although there are variance provisions in the act, many of them do not work that well. Particularly, the innovative control technology variance is a very good concept. It requires a great deal of work to obtain the variance, but only provides us an additional two years, and that two years alone is often not adequate to develop the changes that we need under pollution prevention when we get back into process changes and raw materials changes.

Finally, as I indicated, the compliance schedules of the act give us the same difficulty. The compliance schedules allow time to implement standard available end-of-the-pipe treatment, but not the time that's required to do the research and development work, to evaluate impacts on our processes, to evaluate impacts on our products, to make the in-process changes that we want to make and that you would like to see us make as well.

In conclusion, we need to remove the barriers, and we need more incentives to promote people to do more pollution prevention and increase the program.

Senator GRAHAM. I might just say that the panel on anti-degradation policy is intended to focus in large part on the backsliding provisions, and so I would encourage those who are going to be on

that panel, which includes Ms. Prothro, maybe we could return to this subject at that time.

Senator LIEBERMAN. I was just going to say I think you're on to one of the key issues here, and I want to invite the response of the rest of the panel, because in the legislation that I introduced there's actually less of a role for EPA in pollution prevention. There's a premise that this is one of those cases where if you require the companies to produce plans and publicize progress reports, although not the plans, that there's enough of an incentive that they'll do them without the EPA getting more heavily into it. In fact, some worry that if you create an EPA involvement here that may in itself limit some of the technological work companies themselves might do, and in fact it might delay the presses because of all the responsibilities that EPA has that may mean that the regulations will come out slower. But I'm curious what the other witnesses and EPA representative feel about that, because it's another question.

Senator GRAHAM. Ms. Prothro?

Ms. PROTHRO. Well, I think we've seen over the years, with 51 effluent guidelines having been promulgated, that industry tends not to use pollution prevention approaches, but does tend to go with end-of-the-pipe, so we favor—

Senator BAUCUS. Both a ceiling and a floor, basically.

Ms. PROTHRO. Yes. They tend to go with the model technologies. This may occur some because of the reasons that have been discussed here, but I think our view is that requiring industry to do the plan makes a lot of sense. I also have some concerns about the degree to which EPA should mandate the specific pollutants address or direct exactly how pollution preventing is to be achieved. I think we could serve a very useful clearinghouse function and try to give information to industry and States and others about pollution prevention approaches that are working, but I'm not sure that putting us in the position of prescribing the approaches in any detail will really help, because it may in fact retard some innovation that might otherwise occur.

But, again, I'd reiterate we do support the idea of requiring that the plan be done as part of the permit process.

Senator BAUCUS. If I might, Mr. Chairman, I'm just curious—

Senator GRAHAM. Senator Baucus, and then Senator Chafee.

Senator BAUCUS. The purpose of this provision is to achieve a balance to help resolve the tension between too much restrictive regulation on the one hand and greater toxic reduction on the other, and the attempted balance here, as you well know, Ms. Dawson, is to have EPA name the 20 worst toxics and for a plant who applies for a permit, as a condition of the renewal of that permit, publish a plan which indicates the company's goals and how it intends to reduce its pollutants.

Now, why doesn't that accomplish the objective? That is, we're not telling the plant what to do. We're just saying do something. That's all we're doing. What's wrong with that? Doesn't that give the company infinite flexibility? Doesn't that also help us achieve our goals of greater toxic reduction? Why isn't that a good balance?

Ms. DAWSON. Yes and no. The overall objective—we agree wholeheartedly with the pollution prevention planning and with voluntary pollution prevention planning. My comment is—

Senator BAUCUS. And that's what this is. This is voluntary pollution prevention planning.

Ms. DAWSON. Well, it's called voluntary, but you must recognize that voluntary programs really do become mandates to us.

Senator BAUCUS. But what's mandated? What we're mandating is just that the plant come up with a plan.

Ms. DAWSON. We come up with a plan and submit it with our permit application and make it public, and we have serious concerns about confidentiality issues. I would suggest as well when we talk about the 20 compounds, I think 20 compounds is probably a good number and a good starting set, but we would suggest that you would do better to allow the individual facilities to look at their SARA 313 lists and prioritize those that are the highest risk at that facility. I think one of our panelists indicated—

Senator BAUCUS. What about that, Mr. Roy? Should the company just pick its own under the SARA list, or should it focus on the 20 worst?

Mr. ROY. I don't know if 20 is the right number or whatever, but I think it's certainly appropriate for EPA to give some guidance on what the company should be focusing on.

Senator BAUCUS. That is, to prioritize?

Mr. ROY. Yes, somehow.

Senator BAUCUS. The problem I have is that if everything's a priority, nothing's a priority. It's helpful to set priorities, and, therefore, I think it's important to name the worst first. We can worry about the others later.

Mr. ROY. May I tell—

Senator GRAHAM. Mr. Roy, and then Senator Chafee has a question.

Mr. ROY. I'm sorry, Senator.

Senator CHAFEE. Go ahead. Why don't you answer Senator Baucus' question.

Mr. ROY. If I could tell a short war story, I used to work at EPA, and I worked on something called the Amoco Yorktown Project in which EPA and Amoco picked an oil refinery in Yorktown, Virginia, and studied everything they could about the oil refinery. They went out and they did state-of-the-art monitoring of the emissions coming out of the various production units, which had never been done, apparently, at that level of detail. They took Amoco engineers from Chicago headquarters and people who ran the plant and some of us EPA people and some environmentalists, and they brainstormed about various options for preventing pollution at the plant.

In other words, they were making a huge pollution prevention plan for that refinery, and they discovered things that they had never known about their facility. It was a 35-year-old facility, a Fortune 50 company, and a fairly stable production process. Every hydrocarbon that went up into the atmosphere or went into the Chesapeake Bay was a hydrocarbon they couldn't sell at the pump. So in other words, it was exactly the kind of operation that you would hope would know everything about how hydrocarbons moved

within its facility, but they still were discovering things about the movement of hydrocarbons in the facility.

Now, Amoco's lack of self-knowledge prior to the project that doesn't really call into question Amoco's business decisions, because at some point it doesn't pay to track down every little hydrocarbon for the value of selling it at the pump. What worries me more is that the various regulations that Amoco faced didn't lead them to make those discoveries. The planning provisions of S. 1114 and of Senator Lieberman's bill—especially if you wed them with the whole permitting process—try to lead companies to think about their production process in a fairly structured way. I think it needs to be fairly structured. I think it's appropriate for the priority-setting focus to be determined by EPA.

One of the things that Ms. Prothro suggested a couple of seconds ago was that a lot of the companies tend to go to the model technologies, the reference technologies that are described in the development documents. Actually, in your environmental technology bill, Senator Baucus, which I believe Senator Lieberman is a co-sponsor of, there's a section there that tries to, address the problem created when EPA writes a performance standard around a specific technology the technology is discussed in the development document, and those development document become a bible in the various State agencies that are writing the permits. The verification title of your bill Senator Baucus, tries to get EPA to come up with data on newer technologies and on technologies that apply to specific companies that you wouldn't generally base a regulation on.

For lack of the sort of program that would be created by Senator Baucus's bill, we have companies responding in a reactive way to the EPA regulations and making the ceiling the floor, as you were saying.

Senator GRAHAM. Senator Chafee?

Senator CHAFEE. Mr. Chairman, this isn't a part of the bill that I've been active in. Let's see if I understand this.

I'm going to ask you this, Ms. Prothro. Under the current system, there are end-of-the-pipe permits, and we require best available technology in the case of toxics, and if the toxic is too poisonous in the water, then we totally ban it, but outside of that, if it's all right, the water can take it under the best available technology, that's the way the current system is. Am I right?

Ms. PROTHRO. That's basically right. There's also a water quality standard that may be short of a ban, but might require something more than technology-based controls.

Senator CHAFEE. OK. Now, what we're suggesting here is that 20 pollutants be selected that are most important, and then the companies would prepare a plan for—currently, everything's going all right presumably, but they would prepare a plan for the reduction of these or the prevention of them. Now, that plan would become public. That plan would be required and would have to be submitted to the State authority, and then the implementation of the plan is voluntary. But as was pointed out, since it's public, there would be a lot of public pressure to achieve the goals of the plan. Is that correct?

Ms. PROTHRO. Yes. As I understand the bill, a summary of the plan would be made public rather than the detailed plan itself.

Senator CHAFEE. OK. Now, here's my question to you. This is a water bill we're talking about. As a result of this, would there be any substantial additional improvement in water quality?

Ms. PROTHRO. As the result of this approach?

Senator CHAFEE. As a result of this approach.

Ms. PROTHRO. I believe that there would be. I believe that pollution prevention can get us a long way. We've seen this in the pulp and paper industry now. Once the problems were identified with dioxin in the waste stream there, many of the companies began to move toward pollution prevention. They were able to achieve a lot even before regulations were in place. Others did not move forward. But I think the companies that did move forward showed us what can be achieved with pollution prevention, and it has benefited water quality where that's been done.

Senator CHAFEE. Well, I'm interested to hear that, because I'm not sure whether the goal of this is water quality improvement or other environmental or even health goals. I mean, no one will argue with prevention. We all subscribe to that, whether it's in health care or in these efforts. But I think it's clear for all of us to understand exactly what we're doing here.

Do others agree that this will improve water quality?

What do you say to that, Mr. Roy?

Mr. ROY. Yes, I think this could dramatically affect water quality, but I think you're right that there's potential there not just for improving water quality, but improving environmental protection across the board as well as protection of workers. Maybe even protection of consumers if companies are reexamining their products as well as the production processes.

Senator CHAFEE. Well, I'm not fighting against this. I'm a cosponsor of the legislation, an enthusiastic cosponsor with Senator Baucus. I'm just trying to get squared away in my own mind in connection with this particular section whether this should be in a pollution prevention act or whether it should be under RCRA or whether this is appropriately under the Clean Water Act.

Mr. ROY. Look at the way that pollution prevention works at EPA now. We have the main programs—air, water, waste—and we have pollution prevention a separate program. In some very important projects—I think the pulp and paper project is a shining example—EPA is making some real determined steps toward integrating pollution prevention in its core programs. But until we look at the way that rulemaking, permitting, inspections, reporting requirements all impact pollution prevention in our core programs, pollution prevention is not going to be part of the mainstream either at EPA or at the companies that are part of the regulated community.

Senator CHAFEE. I think another point we've got to remember as we move this legislation along, and I think Senator Faircloth enunciated these, is that there is out there on the Senate floor a natural jumpiness about people coming into a plant and the plant owner being told, "This is all voluntary," but it turns out it isn't voluntary. I think we on this side want this legislation to pass, and we've got to be sensitive to that.

Now, clearly, it's not voluntary, preparing the plan. That's mandated, right, Ms. Prothro?

Ms. PROTHRO. Right.

Senator CHAFEE. Now, the next step; the execution of the plan is voluntary, but as was pointed out, whether it's a summary of the plan or whatever it is, the public knows about it. It's released. So there is considerable public pressure on the plant to subscribe to the preventative measures. I'm not saying that's bad. I just want to get it clear in my own mind what we're doing.

Senator GRAHAM. Senator Kempthorne?

Senator KEMPTHORNE. If I may, just to continue on this clarification, Ms. Prothro, it is a voluntary program, but no permit will be issued until they have voluntarily done this plan.

[Laughter.]

Senator KEMPTHORNE. Is that correct?

Ms. PROTHRO. Yes. As I understand it, doing the planning is mandatory. The implementation of the plan and the contents of the plan are voluntary.

Senator KEMPTHORNE. It's an interesting hook.

Ms. PROTHRO. We believe that when companies look at the advantages of pollution prevention, once they do that kind of planning, they'll want to implement it, because there are so many advantages to it.

Senator KEMPTHORNE. Well, I guess my point is, I'm not so sure we should be so free in using the term "voluntary" if in fact it's a requirement. I just think we need to be straightforward.

Senator BAUCUS. Be fair about it. You used the word "it" in two different meanings in that one sentence. I tell my office all the time to avoid pronouns, because they're so dangerous. One definition of "it" is whether "it" is the plan. The other "it" is the contents. I mean, "it" the plan is mandatory. "It" the contents is voluntary.

And it's not designed to be a hook. It's intended and designed to be a way to bridge this gap, this tension between over prescription on the one hand and achieving a very needed reduction in toxic pollutants on the other. We could go the usual way in the Clean Water Act and just start cranking out these water quality standards and tightening down the effluent guidelines and so on and so forth. I think most of us have come to the conclusion that might have some beneficial effect, but it's excessive reliance on remedial approaches. There's a better way to skin this cat that is not only remedial, but also prevention.

It's the hierarchy that you mentioned, I think, Ms. Dawson, and planning process and life cycle planning, I think people who have studied this issue very deeply are beginning to realize that probably is, all things considered, a more efficient way and improves the bottom line of a company's income statement much more than otherwise would be the case. It's certainly the views generally of, say, Frank Popov at DOW Chemical, an archproponent of this general concept, and there are many manufacturing firms who are also ardent disciples, because they believe the primary benefit is improving the bottom line and that a concomitant, adjacent, adjunct benefit is significant improvement of the environment.

So this is not supposed to be some trick or some gimmick, some hook, you may differ with the way it's accomplished, but the intention is to try to achieve this goal this way.

Senator KEMPTHORNE. I have a whole new appreciation of the concept of dotting your "I"s and crossing your "T"s, which now spell "it."

[Laughter.]

Senator GRAHAM. Just for time management, we are going to take another four minutes on this panel, and then we're going to move to the equally exciting subject of toxic bans.

[Laughter.]

Senator KEMPTHORNE. Mr. Chairman, could I just complete that, then? How will we determine, then, the standards of the plan, and what do you anticipate will be the cost of entities accomplishing the plan? And is EPA geared up so that it can review in a timely fashion for turnaround?

Ms. PROTHRO. Well, first of all, we are in the process of costing out various provisions of the bill, and we don't have any cost estimates right now. I think this will be a particularly difficult provision one to cost out, because it is voluntary and because there's so much discretion allowed to industry as to how they develop these plans. So it's going to be difficult to estimate.

Certainly, we would agree with Senator Baucus' statement that in the long run most industries that have engaged in this kind of planning have found that it's actually been less costly than the end-of-the-pipe controls that are necessary in cases where there is no prevention and that we may need to prescribe in regulations.

I guess your other question was whether or not there would be other requirements in the permit and whether we would review the plans. As I understand the bill, there's no requirement that State or EPA permit writers actually review and approve these plans. They are made available. I think one of the benefits to us would be to be able to use some of the information in a clearing-house way, with proper safeguards for confidential business information, of course, but to be able to allow some technology transfer about efficient ways to prevent pollution so that we don't have to have expensive end-of-the-pipe controls.

But we would go forward with our Effluent Guidelines Program and our Water Quality Standards Program independent of this. This would not replace those activities.

Senator KEMPTHORNE. Thank you.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. Ms. Prothro, would all plants regardless of size, have to have this?

Ms. PROTHRO. I understand that we are to identify those facilities that would be subject to it. Among the possible candidates would be industrial facilities that his change NPDES permits. These are direct dischargers to the waters and significant dischargers to the sewers. I would guess that we would try to select from within that large category those that have the greatest quantity of toxics.

Senator FAIRCLOTH. It would be any size plant. Another question. How much is this going to cost EPA?

Ms. PROTHRO. Well, we have not costed it out yet. We're in the process of trying to come up with some assumptions on that. It does not seem to be a terrifically costly provision, though, because—

Senator FAIRCLOTH. For you all.

Ms. PROTHRO. For us or for the States.

Senator FAIRCLOTH. How about for the factories?

Ms. PROTHRO. We have not costed that out yet. We're in the process of doing so.

Senator GRAHAM. Mr. Roy, Ms. Dawson, do you have any comments on Senator Faircloth's cost question?

Mr. ROY. On the cost issue, pollution prevention provisions like these are in place in 19 States across the country, including North Carolina, actually.

Senator FAIRCLOTH. I'm well aware.

Mr. ROY. So you might be able to get the cost data from those States. And some of the plans are already in—California, Washington, and Oregon already have the plans, and it might be interesting to get the data from them.

Senator FAIRCLOTH. This is a matter of curiosity; out of the last 15 years, has there been a session of the Congress that EPA didn't come out with a new water regulation? Have you missed a year?

Ms. PROTHRO. We're still issuing water regulations, yes.

Senator FAIRCLOTH. Well, do you have any idea what you've got for next year?

[Laughter.]

Ms. PROTHRO. Yes, I could give you a list.

Senator FAIRCLOTH. I'm through.

Senator GRAHAM. Senator Chafee, you get the last question.

Senator CHAFEE. OK. My question is whether, by going after the 20 most toxic pollutants as regards water impairment, we're in fact going after the worst actors. In other words, it may well be that there are other toxics within the plant that don't affect water quality but affect air which might eventually affect water or health. Does this seem to be a worthwhile exercise when it's solely restricted to those that impair the water? What do you think of that?

Ms. PROTHRO. Well, we're still trying to think this through, but I have some concerns about our identifying the 20 pollutants. I'm not sure that we know exactly how to do that in the most effective way. I believe, as you point out, that there may be some that are perhaps not the greatest causes of water pollution problems right now but may be of concern for other reasons, and if this were the only handle we had on pollution prevention planning as opposed to some kind of a multi-media approach, perhaps we wouldn't get at the most important things. So I'm not sure that having us identify the 20 pollutants is a critical part of this requirement.

Senator CHAFEE. I just want to say a word in defense of the pollution prevention and that it can indeed reduce costs. In our State, where we've been involved with pre-treatment, people trying to avoid the costs of pre-treatment have gone to alternative methods—in our jewelry industry, for example—and we've had some remarkable stories of success in which there's been winners in both ways. It's reduced their costs, and it's been a better process. That doesn't mean we can achieve that in every instance, but I don't think we ought to just out of hand dismiss the subject of pollution prevention. As I've indicated, I have some worries whether, going after the ones that impair water solely, we're going after the really bad actors and how to do it. It's a tough area.

Mr. Roy, briefly.

Mr. ROY. Briefly. I think your concern is probably a well-placed one. In my opinion, the facility planning should be absolutely multi-media. Even if we start from a water concept, it should be multi-media, and the prioritization—I think it would be a useful exercise for EPA to go through that prioritization and help the companies out with that—should consider all media issues as well.

Senator BAUCUS. Mr. Chairman, many of the panelists have mentioned the multi-media need many times. It's sort of the buzz word these days, and I agree with it. But in just one minute, how do we begin to accomplish that objective? I mean, it's Senator Chafee's question. Any top-of-your-head ideas, but hopefully thought through, that would give us clues how to address that?

Mr. BAKER. I think another place is taking into account other environmental media when you take an action, and I think that's one way to do it. At least to put some language in that says "consider other media impacts" when you do—

Senator CHAFEE. You mean air?

Mr. BAKER. Yes. Consider them in the process. If you are going to take an action in water, at least you need to consider. Maybe it doesn't mean you take actions in air or you do an analysis of the air, but at least think about and analyze the fact that if you're going to do this action in water, what might be the impacts on other media, and I think as a minimum some language to that effect in there will help make that happen.

Senator BAUCUS. Ms. Dawson?

Ms. DAWSON. Yes, I would agree that that's a good first step. You have to consider the impacts on the other media so that we're not taking a water problem and moving it into a solids problem by removing a residue or putting more into the air from that. Certainly, the other approach is to go with full multi-media pollution prevention planning and look at all the releases at a facility, not just focus on the water, and by that way get the worst problems first.

Senator GRAHAM. Senator Lieberman is going to have the last word on this topic.

Senator LIEBERMAN. Thank you, Mr. Chairman. I just wanted to say I appreciate this discussion, and I'd like to continue on with the committee and ask my colleagues to take a look at the original bill that I submitted here, S. 980, which does say that every company that has to file under the Toxic Release Inventory has to file pollution prevention plans, multi-media, and there's no role for EPA, really, in the proposal or a quite limited role. No listing of the 20 chemicals or regulations.

The theory here is that the market—and this really goes back to Senator Faircloth's questions. In all the experience that businesses have had, they tend to—not only tend to, they do save more money than they spend on pollution prevention plans. So I have an optimism here that if you just require the companies to do the plans, that the system's going to work and that this is one case where maybe it's best not to have EPA too much involved. But, anyway, I really wanted to respond to Senator Faircloth's questions about cost.

Senator GRAHAM. Thank you very much. I think with the level of interest and involvement, this is going to be a central question

within the reauthorization of the Clean Water Act. Thank you very much.

Mr. Baker and Ms. Prothro are going to be part of the next panel. I would like to ask Carolyn Hartmann, representing U.S. PIRG, and John Stein, Director of Strategic Environmental Studies for Anheuser-Busch, if they would please take a place at the table.

This committee has already heard testimony as to the great harm to human and ecological health from what have been called "persistent and biocumulative toxic substances." These chemicals pose dangers to fish, shellfish, and humans as they move up through the food chain. Environmentalists and others have called for the banning of these chemicals because of the threat that even small amounts might pose. Worse still, we hear that many of these substances are in sediment, where they are disturbed by natural causes as well as dredging and reenter the water column only to expose fish again and repeat the threat to the food chain.

Industry has expressed concern that bans ignore the benefits of chemicals to society and we must balance those benefits against alleged harm. The bill as introduced directs EPA to develop a list of toxic pollutants which are highly toxic or biocumulative and then to develop regulations to prohibit their discharge within five years. The bill allows EPA to exempt categories of discharges where technology or pollution prevention options are not available.

In deference to the time, and we went considerably over our scheduled time on the last panel, I'd like to ask if we could move directly into the questions. Again, your prepared statements will be filed for the record.

Senator GRAHAM. Ms. Hartmann, I wonder if you could give us some examples of substances which you believe have had such a deleterious effect on our human or ecological health that they should be banned and how you would suggest that we proceed to do so.

Ms. HARTMANN. I don't propose sitting before this committee today and coming up with a definitive list of chemicals that need to be banned by "X" date. What we are proposing is that the committee conduct a process of investigating the chemicals that have been identified as problems due to their high toxicity persistence or capability to bioaccumulate in the environment, review those lists, and then set up a committee of experts, as it were, to examine that list and make recommendations as to which substances should be phased out or potential uses of those substances should be phased out.

As a second stage, we recommend that what we call the stakeholders—the industries that are using, producing those substances or the safe alternatives to those substances—sit down and figure out what the time lines are for achieving those reductions.

We do know that there are over 70 forms of dioxins that are discharged into the waterways. They're coming from pulp and paper mills, they're coming from the waste water of incinerators, they're coming from the production of chemicals. Dioxins, as you may know, are the byproduct of a number of different chemical processes which are using organochlorines. That may be a place to start, but certainly there are others in the agricultural industry that we need to start looking at as well.

Senator GRAHAM. Mr. Stein, in your prepared statement, you suggest that you think that these bans might be prohibitively expensive and run counter to other societal goals. Could you comment further on your assessment of the desirability of giving EPA the authority to establish a list of these toxics that should be banned within five years?

Mr. STEIN. Thank you, Senator. As we look at the Senate proposal, we see some strong contrasts there. In title III we see some tremendous flexibility being created through watershed planning, and we in the NEDA project endorse that. The approach there is to look at the problems and then to work out a method to attack those in the most efficient manner.

Looking at title II, however, we see a very different approach there in terms of a very rigid approach based upon stringent command and control, getting very close to industrial environmental policy. What we believe within the NEDA water project is that we should take an approach more similar to that used in title III. That is to say, let's identify the problem with good science and solid monitoring. Let's look at where the problems are, determine that they're really genuine problems, and then before we dictate solutions, let's see what the market can do to bring about solutions that address both environmental and economic concerns.

I think as an example of that, one approach that should be considered is pollutant trading. There certainly, I think, are precedents there within the Air Act. It's a concept that's been around for 15 years in California and is quite successful there. The South Coast Air Quality Management District is taking it a step further with their reclaim program.

I think that if we look at market-based incentives that there is an opportunity to move more quickly and to encourage innovation, and it's possible that we may be able to achieve our solution more quickly and at less cost than through strict command and control.

Senator GRAHAM. Ms. Prothro, there have been other examples in which EPA has been given the directive to develop a list and restrict or prohibit activities. The record of those mandates has been a mixed one. What would you think is EPA's capability, knowledge and administrative, to carry out a directive to identify and then prohibit certain toxics?

Ms. PROTHRO. We have authority now under the act, under 307(a), to ban pollutants, but it's one of many tools in our toolbox that we've used quite rarely. It's an especially difficult process that we have to go through to use that particular tool, and we would certainly support some streamlining of it. We realize that there are probably only going to be a small number of pollutants that we're going to need to address in this way—small compared to the many thousands of chemicals that are being discharged in our Nation's waters, at least.

What we're most concerned about and where I think a ban would be most appropriate is where a chemical is bioaccumulating—going up the food chain—or persisting in sediments so that sediments that are dredged from our harbors are not easily disposed of. These kinds of pollutants are a particular problem in estuaries and in the Great Lakes and other lakes, and for those a pollutant ban sometimes is really an appropriate response.

Now, many of the most toxic chemicals and most persistent chemicals that we find in fish and sediments are already banned to some extent—chlordane, DDT. Dioxins are an unintended byproduct of other processes. A pollutant ban may not get at those too well in a lot of circumstances. Mercury is often released into the air. These are the pollutants that we see most often causing these persistent bioaccumulation problems, but there are other chemicals that are cause for concern, and others may emerge if we learn more. So strengthened authority in this area would be, I think, a good tool to add to our toolbox.

Senator GRAHAM. Mr. Baker, if you could, from the State's perspective.

Mr. BAKER. I would agree a lot with what Martha said. The first place to look for the substance is in the fish and in the sediment. The things that are showing up in fish that are causing public health concerns, the ones that are moving up the food chain, are clearly the ones that any additional quantity of release is going to be a problem.

I've been heavily involved in the Great Lakes and trying to manage the Great Lakes issues, and we've come to the conclusion in the Great Lakes discussions, particularly with Canada, that it makes sense for certain substances to look at a ban. No longer can you try to deal with these issues through end-of-the-pipe or dealing with just the point sources. I think the issue that we're going to have is that doing a ban is going to have to be, in some cases, broader than just the water discharge, because, for example, the things that we're seeing that are causing problems in the Great Lakes are also coming from air sources and other products that contain those substances.

So it may be a good start to look at water, but it certainly has to be considered in a broader context in order to really be effective for the ban. Bans are very difficult to do. It can be very hard to be 100 percent successful, and I think that it ought to be carefully used so that the list of substances where there are bans is limited to ones that are really in a category where they need to be dealt with in that fashion and not try to have an extensive list, which I think will dilute the effectiveness of a ban. But, clearly, I think there's a role for bans when you're dealing with certain substances.

Senator BAUCUS. Mr. Chairman, I've got to leave.

Senator GRAHAM. Senator Baucus?

Senator BAUCUS. Mr. Stein, do you agree with the concept, or do you not, of bioaccumulation—that is, that there are some chemicals that do bioaccumulate over time and cause a greater problem than would be at the initial level of emission? Do you agree with the concept?

Mr. STEIN. Senator, I think that's been demonstrated.

Senator BAUCUS. OK. Next question. Do you agree with the concept that there may be some pollutants that over time should be banned as a consequence of bioaccumulation?

Mr. STEIN. I think it's something we have to look at very carefully. Over time there have been very few substances that have been subject to the equivalent of the death penalty. I think it's something we need to go at very carefully and very cautiously to be certain that we have adequate substitutes for those and that we are

not creating one problem by eliminating another. Right now in our industry and in related industries we're looking at the issue of what we'll do without methylbromide as a fumigant.

Senator BAUCUS. I understand. That's very true. It's a question that's reasonable and responsible, but nevertheless, pushing steadily onward, we have banned CFCs, for example. Everyone agrees that it had to be done, even though a few years ago various companies said, "Oh, gee, you can't find substitutes, and it's incredibly expensive," and so on and so forth, but we are developing substitutes. There are some side effects of some of these substitutes, that's true, but I just think it's important if bioaccumulation is a problem that we push very hard and very aggressively and responsibly to try to find those substitutes, and we should not shirk or slacken in our steadfast devotion to that goal.

I'm glad you agree with the concept. I think that helps advance the ball. The next step is to make sure we do it responsibly.

Thank you.

Senator GRAHAM. Senator Lieberman, do you have a question?

Senator LIEBERMAN. No thank you, Mr. Chairman.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. No, not right now.

Senator GRAHAM. Mr. Stein, you mentioned the idea of encouraging industry to voluntarily look for ways in which to limit or restrict the use of these items. Could you discuss further what is the current state of industry's efforts to identify and limit or restrict or prohibit the use of bioaccumulative substances, and what might be done to accelerate that industry initiative?

Mr. STEIN. I think Ms. Dawson has talked about a number of incentives already this morning that would be useful to industry in terms of encouraging industry to pursue alternatives to certain toxic materials. Certainly, the issue or the concept of being able to trade pollutant loadings also would create an incentive for industry.

I would say that in the industry today we have a strong focus on total quality, and that's been extended into the environmental area as well. In our own experience, we are looking at ways to empower our employees and to drive the focus on pollution reduction down into the organization and to challenge the capabilities of our employees to come up with new concepts, and we've been significantly successful with that in everything from water conservation to solid waste reduction. I think we need to recognize the efforts that industry has made here and to encourage cross-fertilization between industries to maximize the benefits from that effort.

Senator GRAHAM. Yes, Ms. Hartmann?

Ms. HARTMANN. I think that while there are industries in this country that are taking the lead and certainly trying to move away from using the most toxic hazardous substances, unfortunately the vast majority of companies are not playing that role. There was a study recently done by a group called Inform, which went in and looked at a number of chemical industry plants, and they found that despite the fact that those facilities could put into place a number of source reduction and toxic use reduction changes in that plant and basically pay for those changes in a very short period of

time, that the majority of companies are not making these kinds of changes.

We would argue that with the vast majority of chemicals, the approach that Senator Lieberman is putting forward, the pollution prevention planning approach, is appropriate, but that with some substances that are extremely toxic, persistent, and bioaccumulative, we really need to take a more aggressive approach and set outer limits for the time period that those substances can be used.

We saw with the example of the CFCs that industries actually slowed down their research in looking for alternatives immediately after one use of CFCs was reduced, and that's the aerosol use, and the money going into research only increased again when the pressure began to build for a phase-out. So a discussion about a phase-out definitely seems to be encouraging industry to look for the safer alternatives.

Senator GRAHAM. Senator?

Senator FAIRCLOTH. I'll start with Ms. Prothro or anyone that wants to answer the question. Could you give me a specific example of a recent health problem to humans caused by the discharge of a permitted facility? What we're going after is, can you tell me of a specific problem caused these toxins?

Mr. BAKER. I think the best example that we have is the Great Lakes with PCBs. Now the manufacture of PCBs has been prohibited, but PCBs are still being generated from some sources, air sources and water sources, and they're making their way into the fish. There have been studies that have been pretty conclusive in terms of their effect on wildlife and also on human health.

Senator FAIRCLOTH. Is that still happening today?

Mr. BAKER. Yes, there are active discharges of PCBs—

Senator FAIRCLOTH. Into the Great Lakes?

Mr. BAKER. Into the Great Lakes. Absolutely. And that's of serious concern.

Senator FAIRCLOTH. Well, isn't that against the law now?

Mr. BAKER. The problem is that you can set a standard, and the standard assumes that there's some safe level of a particular substance, and that's what we're charged to do in the Standards Program. What happens with the Great Lakes is you have some systems that are overloaded with that particular substance, and, therefore, you really need to have another tool that says not only do we need to eliminate further release into the Great Lakes, but we probably need to find ways to actually destroy and reduce the PCBs that are there.

Senator FAIRCLOTH. Are they coming from industry, or are they coming from runoff water?

Mr. BAKER. They're coming from a variety of different sources.

Senator FAIRCLOTH. How are you going to stop them from runoff water?

Mr. BAKER. Well, I think you need to go back to the sources. If they're coming from storm water, likely it's from an air source, through air deposition, where they're making their way into the storm. Go back to the root source and make sure that we eliminate it.

Senator FAIRCLOTH. What's the level of PCB that you're permitting in waste water?

Mr. BAKER It's a very low level, and basically it's at level of detection.

Senator FAIRCLOTH. What level is that?

Mr. BAKER. It gets down into the parts-per-billion level in terms of level of detection, but—

Senator FAIRCLOTH. Wait a minute now, because I want to understand this. It comes down to parts per billion that you can detect to now.

Mr. BAKER. Right.

Senator FAIRCLOTH. If you get levels above that, you can't turn the water loose. Is that right?

Mr. BAKER. Right.

Senator FAIRCLOTH. Now, what would this law do? You'd get tighter than that?

Mr. BAKER. Yes. It would go back into the system, and there are places where you can go back further into an industry and detect it. We're only measuring at the point of discharge.

Senator FAIRCLOTH. What are you going to get down to, parts per trillion?

Mr. BAKER. We basically want to eliminate it altogether so there are no PCBs.

Senator FAIRCLOTH. Is it possible to eliminate?

Mr. BAKER. Yes. In some cases, it is; in other cases, maybe not.

Senator FAIRCLOTH. Let me tell you something I did with PCBs. A very bad company that was rebuilding power transformers in North Carolina dumped miles of it on the shoulder of the highways. Miles of it. For all intents and purposes, we stopped the highway program. We moved PCB material. Millions of dollars was spent digging it up, all of it, many hearings were held to decide where we could put it, but finally, it was removed. We had hardly gotten it moved when the EPA said it really wasn't as bad as we heard it was and we probably committed more problems moving it and hauling it than we would have leaving it there. You told me to move it, and we moved it. Then you said, "It really wasn't necessary to move it. You could have left it there."

Ms. PROTHRO. Senator, I think part of the problem is that by the time we see PCBs in the discharge pipes, there's been a lot of dilution. I think what a ban would help us to do is to go back to the source, as Mr. Baker said. When you go back to the source, you may well find it in levels above detection, and you can stop it there before it mixes with rain water and other things that will wash it off into the receiving waters.

Mr. BAKER. Let me just add that the parts per billion is the concentration. When you look at mass loading on an annual basis, there's something like 290 or 300 pounds of PCBs that are being released in the Great Lakes, which doesn't sound like a lot, but it's enough to cause fish—

Senator FAIRCLOTH. Two hundred pounds are being released from where?

Mr. BAKER. From all sources.

Senator FAIRCLOTH. Into the lakes?

Mr. BAKER. Into the Great Lakes.

Senator FAIRCLOTH. All five of them?

Mr. BAKER. Yes.

Senator FAIRCLOTH. How many pounds?

Mr. BAKER. Two hundred and ninety pounds, I think.

Senator FAIRCLOTH. How often?

Mr. BAKER. That's on an annual basis.

Senator FAIRCLOTH. A year.

Mr. BAKER. But that's enough PCBs to cause fish advisories so that people cannot eat the fish in the Great Lakes because those concentrations accumulate in the system. The system is already loaded, so you're dealing with a system that can't tolerate any additional releases.

Senator FAIRCLOTH. All right. Could you give me a specific example of a human affected by eating a PCB-laden fish out of the Great Lakes?

Mr. BAKER. I'm not an expert in the area, but there are studies that have been done—

Senator FAIRCLOTH. I thought you were the expert.

Mr. BAKER. In the area of human health. But there are—I can tell you of the studies that have been done that have shown that there have been effects on babies as a result of mothers that have been breast-feeding their babies milk that has PCBs in it, and there are questions about effects at birth, and there are questions about the ability of those babies in terms of their performance over time.

Senator FAIRCLOTH. Would you send me a copy of the studies?

Mr. BAKER. I'd be glad to.

Senator FAIRCLOTH. All right. I'd like to see them. Thank you.

Senator GRAHAM. Thank you very much, Senator.

Thank you very much to the members of this panel.

The next panel is effluent guidelines. Again, Mr. Baker and Ms. Prothro are going to continue to advise us. They'll be joined by Ms. Jessica Landman, representing the Natural Resources Defense Council, and Ms. Anita Dawson, Manager of Environmental Affairs of American Cyanamid Company, will return.

Senator GRAHAM. The Clean Water Act provides for technology-based standards called effluent guidelines, which establish nationally consistent minimum levels of treatment for categories of point sources. The act also provides for water quality standards to be used where the technology-based standards fail to achieve water quality goals. More than half the existing effluent guidelines and new source performance standards have not been changed or updated in over a decade, even though they are supposed to reflect improvements in technology.

This legislation would allow EPA to include in these guidelines source reduction practices, including changes in production processes. In addition, effluent guidelines are to prohibit or limit cross-media transfer of pollutants where, technologically and economically, those are achievable. The bill requires EPA to review existing effluent guidelines and to revise them whenever there have been significant changes in factors relating to the guidelines, including advancement in treatment or source reduction practices. The bill also directs EPA to assess fees in order to offset the full cost of developing and publishing guidelines and standards. EPA estimates that it costs \$2 billion to \$5 billion to develop a new guideline.

Industry has indicated strong opposition to some of these changes, finding them to interfere with the manufacturing process.

Ms. Dawson, I understand that industry is concerned about the provisions of this bill, such as those that would allow EPA to revise guidelines to be updated to reflect new technology, because they may have just made a substantial investment to comply with the standards, only then to find EPA changes the rules. That is an understandable concern. I would be interested in your further comments as to the effluent guidelines provision of this legislation and any recommendations that you might make as to how the National Government should deal with the issues that have led to this set of proposed changes.

Ms. DAWSON. Senator, you're right, we are concerned. We're very concerned about this effluent guidelines provision. I think that we need to recognize that there are existing programs in place. We already have the Effluent Guidelines Program controlling our discharges as well as water quality base limits, and the Effluent Guidelines Program—both programs are continuing to evolve. Effluent guidelines are reviewed on a periodic basis, and in fact when EPA looks at our processes during effluent guidelines development, where we are using pollution prevention practices, those are incorporated via the lower numbers in our discharges that EPA sees.

So I'd like to differ with Martha somewhat on her comment that we don't have pollution prevention now through effluent guidelines. We feel strongly that we do. We do have pollution prevention practices in our plant. Perhaps not 15 years ago, but currently we are moving further toward that, and they should be included in the effluent guidelines process as it moves forward.

In regard to the provisions for effluent guidelines in this Senate bill, we are very concerned that they require EPA to rely on and require source reduction measures and practices that include changes in the production process, the products, and the raw materials that we use. This completely disregards the complexity of these changes. We feel, as does EPA, that they cannot practicably define measures and practices, and I'll tell you why we think EPA feels that way, and we also feel that these decisions about manufacturing, about our products and processes, should be left in the hands of the industry so that we can control our own destinies and complete on a global basis.

Let me give you an example of a recent pollution prevention project that we're working on in my company right now. We're making a relatively simple change in one process step. It's a batch oxidation reaction. We're changing it to a continuous reaction. This is reducing our pollutant loading by 50 percent, it's reducing our volume by 25 percent, and it's also helping us in increasing product yield and quality. So we certainly have incentive to move forward through this. But it hasn't been simple. It's taken more than six months of work in laboratory development, in small-scale testing, and in full-scale trials to evaluate the impact on every process step, to evaluate our analytical methods as we go and revise them so we can have full knowledge of the products and the byproducts in each process step, and finally going into a full-scale trial and working this out in the plant.

In addition, let me just comment on the people that are involved. It's involved process chemists, research chemists, analytical chemists, lab personnel, process engineers, and process chemists. It's a very involved, complex process to make those type changes, and we're concerned that EPA cannot really do that for us. There are thousands of chemical processes that exist, and when you get two chemical processes such as many of ours that we are the only company working with, it's just incomprehensible for us to see that EPA could do that for us.

The reason that I say that we feel that EPA also has a concern on this issue is that in the organic chemicals effluent guideline rule that was issued on May 28th, EPA had looked at requiring recycling, and they determined themselves that the type of major research and development effort is far beyond the scope of what they can practicably accomplish, and that's a statement from the preamble to that rule, Senator.

Senator GRAHAM. Ms. Landman, what do you believe are the principal defects in the current law or implementation of effluent guidelines?

Ms. LANDMAN. The changes that are recommended in your bill, we think, represent important evolutionary changes to get at some of the defects in the way that the law has been implemented to date. Problems that we have identified include the failure of EPA to take steps that would prevent industry from selecting a waste water treatment technology that, for example, could have a cross-media impact, such as a technology that results in the removal of a substance from the water only to transfer it to the air. The changes that would be made in the law by your bill that would authorize EPA to prohibit the selection of a waste-shifting technology would get at that problem.

Another very important problem has been EPA's failure to update and revise these regulations over time as technology has evolved. You mentioned earlier that some of these regulations are 20 years old or 10 years old and need to be revisited. It's very important that issue be addressed both by providing the agency with adequate resources and by providing a clear mandate to plan for and then carry out those plans for revising the guidelines on a regular basis.

The underlying philosophy of effluent guidelines was, at the time this law was enacted, that technology will continue to evolve and that we should be discharging to the waters only so long as we lack the technological capability to achieve our zero-discharge goal. That's why we think that the evolution of guidelines over time is so essential, and other changes in your bill that would be made to the law that focus on the need to identify zero-discharge technologies and select them where they're technologically and economically achievable also, we think, would help push the agency in the direction that they have been inadequately focused on before.

We thought that there were options, for example, to select zero-discharge technologies, at least for new sources, perhaps in the organic chemicals industry, and we found that the agency did not adequately address the availability of those zero-discharge technologies that really could close the loop potentially in certain catego-

ries. Your bill would help to move things forward in that direction, so that's another very important change.

Senator GRAHAM. Ms. Prothro and Mr. Baker, Ms. Landman has just outlined some of the defects, as she sees them, in the current law. To which degree are those matters of the law itself or the resources available to the agency or the available scientific capability to deal with questions like shifting across media?

Ms. PROTHRO. I guess I see them as sort of intertwined. To the extent that we can streamline and improve the effectiveness of the law, then we'll have more resources to devote to producing effluent guidelines. We do appreciate the bill's attempt to give us a new resource base for the Effluent Guidelines Program through the fee. We're still looking at that and haven't taken a firm position on it, but certainly it's an expensive program. We gather a lot of data, we look at a lot of different industrial facilities, we have to anticipate litigation over virtually every industrial category that we regulate, and that means we have to have an extensive record to defend the decisions that we make.

Now, this is appropriate. We're not arguing that we shouldn't have to do that. I'm just saying it's an expensive program, and sometimes it takes a long time. Sometimes I think if we had the single, unified standard that the bill proposes and some of the other improvements that the bill would give us, we could move faster and meet our schedules better.

I did want to respond to Ms. Dawson's point about some plants doing pollution prevention now without an EPA mandate. We certainly recognize that, and we're not arguing for the authority to prescribe process changes. We're merely saying it would be helpful to us in defending ourselves in this type of litigation and in developing the guidelines to have clear authority to consider process changes and other pollution prevention methodologies as a basis for our guideline limit instead of focusing just on end-of-the-pipe controls. Once the limit is set, the industry would still have flexibility to come into compliance by a means that they select that's most effective.

We have in fact required recycling in a number of cases. We have set zero-discharge limits on occasion. We're moving more and more under current authorities to using pollution prevention as a basis for the guidelines, but having the law improved in this way will help us to defend that approach and maybe avoid some of the time-consuming and resource-intensive litigation and dispute that we go through now.

Senator GRAHAM. Mr. Baker?

Mr. BAKER. Well, the States strongly support these provisions. We have really been the victims of the lack of progress on effluent guidelines, because what you have then is a situation where each State is trying to move things forward on a State-by-State basis and on a discharger-by-discharger basis rather than approaching it across the country on effluent guidelines. So I think the provisions in the act are appropriate.

I won't repeat the comments that were made by Ms. Landman and Ms. Prothro. I think they're excellent comments. We also see the need to make sure that resources are there at EPA to make this happen. But we want to see them done, we want to see them

kept up to date, we want to see them done in a timely fashion. We think we need to have effluent guidelines to be there alongside water quality standards in terms of managing water quality.

Senator GRAHAM. Ms. Prothro, you mentioned the cost and other administrative concerns relative to this area of the legislation. Do you believe that the level of fees that would be allowed to be charged and the time to carry out the various requirements are administratively reasonable?

Ms. PROTHRO. Well, we're still looking at the fees provision. I guess our primary concern there is the collection mechanism. Because many of the dischargers that we would be regulating discharge to sewers, we think we'd have to work out arrangements with localities and States. We need to talk with the Treasury Department about how that would all work. So we're still looking at that, and I'm afraid I'll have to get back to you. We look forward to working with you on it.

With regard to the time lines, to some extent I think the bill really improves our ability to meet mandatory time line; thus, we think that it's more reasonable than current law. I don't want to guarantee that we'll always be able to meet even these new deadlines, because that does depend largely on the resources available to us, the complexity of the industries that we're regulating, and the degree of controversy that arises in the rulemaking process. But we think this moves in the right direction, gives us a better framework in which to administer the program.

Senator GRAHAM. Ms. Dawson, I understand that industry has raised some objections to the provisions that would allow EPA to include source reduction in effluent guidelines. You alluded to that. This discussion is somewhat a reverberation of what we talked about earlier in the prevention of pollution. Do you believe that this is an excessively intrusive step into the internal operations of a business?

Ms. DAWSON. Yes, Mr. Senator, we believe that this is excessively intrusive. As I indicated in my earlier comments, our processes are complex, they're very specific, and we don't believe that it is appropriate for EPA to get that involved, nor do we feel that they would have the capability of doing that. We have specific people that have worked on these processes for years that work on these pollution prevention programs. There's a great amount of expertise that must come from the industry itself in looking at those programs.

I found it interesting that Martha, in her comments, stated that EPA would like the authority to consider pollution prevention and source reduction in setting their effluent guidelines. Mr. Senator, we feel they already have that authority to consider, and our concern with this bill is that it doesn't require them to consider. It says that they must rely on and require those changes.

We don't see that as a feasible mechanism for EPA to tell us to go into a specific process and make a change without using our own expertise to develop those changes, because many of the pollution prevention ideas that we try and work on simply don't work, and I don't know how EPA would be able to tell which ones will work in our processes and which won't. These changes can have and do have significant impacts on our products. They can change our product quality slightly that would ruin our sales. No one

would want that product any longer with the change in characteristics.

So they do matter intensely to us, and we're very concerned that we remain globally competitive in these very difficult times where we're pushing as hard as we can with TQM. We are practicing pollution prevention to improve our processes as well as to prevent pollution, because it's the thing to do. We live near our plants as well. We're not interested in being polluters, and we really don't feel that we are, Mr. Senator.

If I may, I'd also like to just comment a moment on the effluent guidelines themselves and the process of continuing to develop them. I was a little surprised—I do focus on my own company, and in my own company we just had organic chemicals guidelines, our pesticides guidelines are coming, and pharmaceutical guidelines are also coming, so it was my impression that the guidelines were being revised, certainly the ones that impact us, and we have made significant progress in the chemical industry, as I said earlier, on reducing releases to water, as shown in TRI, by 78 percent between 1987 and 1991.

So I see that the existing program has the authorities needed, and it is working, it continues to tighten down, and on top of the technology-based standards, we have water quality standards that EPA sets to ensure that we're not deteriorating water quality.

Senator GRAHAM. Ms. Landman?

Ms. LANDMAN. I'll respond briefly, if I may. The Effluent Guidelines Program, as was mentioned earlier, is a floor—where the baseline of technology ought to be nationally. I think the earlier discussion this morning on pollution prevention and the need to have facility-specific pollution prevention planning really highlighted the extent to which these two programs need to work in concert.

Effluent guidelines are not going to in the future, any more than they have in the past, go into each and every single plant and dictate anything about how that production process works. Instead, they will look to the releases from that plant, and they will apply on a category basis, not on an individual facility basis.

I think that what we heard this morning was that even after facilities have achieved that national floor, which is where the effluent guidelines are going to take them, and that floor is going to, we hope, be continuously moving us toward our goal of zero discharge, there will still be plenty of room for innovation and facility-specific activities to occur in a pollution prevention planning process, which will remain the facility's own decision making process.

Senator GRAHAM. Are there any other comments by members of the panel on this issue?

[No response.]

Senator GRAHAM. If not, thank you very much.

The next subject is water quality standards. Ms. Prothro, Mr. Baker, and Ms. Landman will continue, and then Mr. Jeffrey Silliman, Manager, Environmental Affairs, Milliken & Company, Spartanburg, South Carolina, representing the American Textile Manufacturers Institute.

Two days ago the subcommittee received a report from the General Accounting Office. This report was critical of EPA for its fail-

ure to update water quality criteria documents. These documents are used by the States to develop water quality standards, which are the used to set permit limits to achieve the standards. It is at the heart of the pollutant discharge control.

GAO reports that nearly all the criteria for priority pollutants that have been developed were developed over 10 years ago, and few have been updated since. Worse, GAO reports that while EPA acknowledges that there are serious impacts from pollutants not even on the list, EPA has no plans to modify or expand the priority list to include them. The final legislation seeks to address this problem by requiring EPA to develop a plan and schedule for the issuance of criteria within two years of enactment and every five years thereafter.

With respect to toxic substances, the bill attempts to speed up the process by declaring that new criteria documents to water quality standards be enforceable on the date of publication unless the State objects and adopts an alternative standard within three years. States are to adopt standards based on criteria within three years of the publication of the criteria.

Ms. Landman, I wonder if we could start again with a question that I asked you on effluent guidelines, and that is, what do you think are the problems with the current law and its administration?

Ms. LANDMAN. The problems in part are covered by the GAO report which you just alluded to, that have to do with keeping the criteria up to date; but going beyond that, there is the scope of criteria. There are numerous substances of concern for which no EPA criteria documents have been written to date. In particular, we have major gaps in the area of items that affect water quality, such as sediment contamination. We need sediment quality criteria very badly. We need criteria that address the problems of biological integrity of waterways, and we need criteria that address wildlife and the impacts of water pollution on wildlife.

These are all areas where EPA has been limping toward the development of some national criteria documents for a very long time, and we need some kind of a resource commitment on the part of EPA and on the part of the Congress, and we also need an additional political commitment, I think, within the agency to address those gaps.

In addition, water quality criteria documents originate with EPA, but then form the basis for State adoption of water quality standards. The process of converting those EPA criteria into meaningful State standards has been extraordinarily slow and cumbersome. In 1987 the Congress mandated that States, within the next triennium—that is, by 1990—adopt for themselves water quality standards based upon the EPA criteria documents that did exist for toxic substances.

The process was—I should say the three-year time table was not followed by a large number of States. Ultimately, EPA was compelled, in part, I think, through litigation brought by NRDC, to step in and promulgate standards for a dozen States that even four and a half or five years after enactment of the 1987 amendment still had failed to act.

The committee's bill takes a number of very important steps to fill in these gaps and deficiencies. Notably, it does commit the agency to a planning process that will result in the development of additional criteria, and second, and very importantly, it speeds up the process by which those criteria are translated into meaningful standards at the State level.

There are a couple of areas in which we feel that additional changes are needed to make sure that these gaps are filled in an appropriate fashion. First of all, there are specific substances that we think ought to be listed in the bill for which standards ought to be mandated to be developed by the agency and then translated into something important at the State level in terms of State standards. Second, we are concerned about an open-ended planning process, because we had, unfortunately, some negative experiences in that regard with respect to effluent guidelines in the last ground of the Clean Water Act reauthorization.

So what we would recommend would be that the legislation not simply commit EPA to the development of a plan, but that it be more specific with respect to how long that list of substances ought to be that ought to be addressed and that sort of thing. In other words, broad discretion for the agency, but with a bit more direction from the Congress as to how that discretion ought to be exercised.

Senator GRAHAM. Mr. Silliman, what are your comments as to problems with the current law and its implementation?

Mr. SILLIMAN. Thank you. I think, number one, existing programs—this has been stated—were essentially authorized by EPA in 1987 to address these persistent toxics. If we compare this to the effluent guidelines, in operation for over 20 years, we see significant improvements in the quality of our Nation's waterways because of the effluent guidelines. We have not really yet seen the impact of these toxics showing up in permit limits yet, because they are only just now getting into the permit renewals.

A very specific concern that I have, representing the textile industry, has to do with the water quality criteria for metals. When I bring up metals, I want to assure you this is a broader issue than just the textile industry. We're talking about the mining industry, we're talking about the computer industry, electronics, we're talking about dentist offices, we're talking about photo finishers.

The problem that I have with the water quality criteria for metals is that these were based on laboratory science where we used relatively pure water and the most toxic form of the metal and the most sensitive species and used this to establish the criteria. There's no consideration of what exact form this metal would really have in the environment.

In the textile area, very specifically our concern is that some of our dye stuffs have a metal which is part—it's incorporated into a much bigger molecule that we use to color fabric, and it is very clear that these materials are not toxic, and that can be demonstrated. But because of the way the regulations have come through, our permit limits are established based on these very toxic form of metals which were used to drive the criteria.

This is not a cheap problem. I'm talking per facility \$1 million of capital investment and probably an additional cost of \$500,000, and

none of this is for any demonstrated environmental improvement. I certainly question its impact on the competitiveness of our industry, which is faced with significant imports.

This past year in January—and I commend EPA, because they recognize that there are problems with the current criteria—they pulled together from the leading scientists, both from their laboratories as well as academic institutions, to spend four days talking about this issue in Annapolis, Maryland. I wouldn't propose to try to summarize four days of very highly technical discussion, but two key conclusions that came out of this were, number one, that EPA needs to focus on the bioavailable form of a metal. That is a form of the metal that can interact with an aquatic species in some way as to cause harm, which we would interpret as toxicity. The second was that the textile dyes that contain metals clearly were of a very different chemical nature and were never intended to be covered by these criteria.

If I made some specific recommendations for the current bill, I'd say, number one, let's make sure we have good science behind these criteria. When you simply mandate a schedule, and a tight schedule, and there's not funding there to do the proper research, inherently the agency has to make very conservative assumptions. Those conservative assumptions, when they get implemented, can be extremely costly.

The second one is to focus on the bioavailable toxics. Let's deal with the big problems first, and let's get those behind us. We do not have infinite resources to address every problem, to address every material that we can detect analytically.

Last, I would propose that we mandate an advance notice of proposed rulemaking and guidance. The problem is that when guidance is put out there, it's simply guidance from EPA. When it gets to the State level, it's implemented as regulation. There has been no opportunity for good public input into the development of that guidance, and that would be the purpose of that—let the affected parties come to the table and have their input and allow public comment before that guidance goes out.

In summary, my recommendations are good science, focus on bioavailable toxics, and advance notice of proposed rulemaking. Thank you.

Senator GRAHAM. Thank you very much.

Ms. Prothro, Mr. Baker, would you like to comment on that diagnosis of the current problems?

Mr. BAKER. Let me go first. There's probably no group that has struggled more with this issue of water quality standards than the States. We're the people that have to take those national guidelines and translate them into standards and then into permits, and then we have to enforce them. The problems that are now being identified with the criteria are not new to the States. We've been making a lot of noise over time about the need to have better criteria. It's one of the—probably the main reason why water quality standards are not being adopted as quickly at the State level as they need to be.

Your idea in the legislation of a plan for the development of criteria we think is an excellent idea. I also think that there needs to be some emphasis on the resources at EPA to make sure that plan-

ning gets carried out, and also some mandate to make sure that what's in the plan gets done in a timely fashion. It's not going to help to have plan that does not get implemented that provides us with the relief that we need in the criteria.

Another area that has come up and you're trying to deal with is the speeding up of the process. We're very concerned about the presumptive applicability once the criteria is issued. We think there's a great benefit to the State adopting water quality standards. That's where we get into all the issues of due process, the education of the public and understanding of the review of the science, the translating it so that it makes sense. I mean, the standards for Florida have to be different than the standards for Wisconsin. Trying to address those things at a national scale is nearly impossible. We do need to have that translation to the local geographic situation. It has to occur.

Now, if you go ahead with the presumptive applicability, which we hope you don't, I would make some suggestions that it only apply to new standards and not to the revision of existing standards. In many cases, States have already adopted a lot of these standards, and if there's a revision that gets issued on a criteria, the concern that we would have is that you may have States that have more stringent standards that are operating effectively with that standard, and with this presumptive applicability, you may see some backsliding on standards that may be difficult for a State to prevent. It will be very hard to argue continuation of a more stringent standard when suddenly something comes out and it's enforceable at a national level.

Also, we would urge a very formal role in the development of the criteria. One of the things that frustrates us is we have to implement these things, we know the problems with these criteria, and yet it's very difficult for us to play a direct role in the development of the criteria. We have good scientists at the State level that can provide meaningful input. We know the problems of implementation of some of these numbers. The metals issue is an old, old issue to us that we're all trying to struggle with, and yet we're not directly plugged into the process. If we could have a direct formal role of the States in the criteria development and in the preparation of the plan for criteria, I think you would have a lot more comfort with States in terms of the process.

Finally, a major issue for us is focusing also on implementation issues, like mixing zones. Mixing zones has been highlighted in the bill as a critical issue for translating a criterion into a permit limit. There are many other issues like that. For example, flows. What type of flows do you use to calculate effluent limits? If we're going to have national consistency, if we're going to have meaningful water quality standards, we need to have, at the same time a criterion is developed, the translation criteria or guidance with that. Unless you have that, you could adopt the same number and apply it to every State, but because each State has its own translation mechanisms, you'll have 50 different results and permits. So it's a two-part process that needs to be looked at.

In our written testimony, which I won't go through, I listed some other areas where we think there can be some strengthening. I don't know that we need to have major changes in this part of the

act to get some of these things done, but certainly the effort to strengthen the criteria development is a very important one.

Thank you.

Senator GRAHAM. Ms. Prothro, in addition to responding to what has been said, I'd be interested in your comments on the GAO report. Do you believe that it accurately reflects the current state of this part of the program?

Ms. PROTHRO. Well, let me take that first. I believe that the document I've seen, at any rate, is a preliminary summary of where GAO is in doing a study, which they have not yet completed. I hope that we're going to be working with them more on this. They seem quite focused on the need to update the priority pollutant list. It's certainly true we have not been updating the priority pollutant list. The main reason is that it doesn't have much significance in terms of the law or our regulations at this point. We do have flexibility to go beyond the priority pollutant list in our regulations. We often do. We're not restricted.

Now, I'm very interested in some of the comments that GAO has made indicating that perhaps, out in the field, folks are more focused on the priority pollutant list than we are here in Washington at EPA. We'd like to learn more about that. If that's true, then I do have a concern about the need to update the list. But I think that's something we need to work with them on and understand a little better.

We are in fact updating our methodologies. It's taking a while to do that. We're consulting widely with scientists around the country. Our own science advisory board is helping us with that, and we will be revising our methodologies both for human health criteria and for aquatic life criteria in the near future. Then we'll have to revise the existing criteria to reflect that. I think we've learned a lot in the last few years about bioaccumulation and some of the other subjects that we've talked about here today that do need to be reflected in the criteria.

We fully support the plan concept that's in the bill. We think that's a good one, and we certainly support the notion that it would be done in a very public forum and that we'd get input from a lot of different parties. I think we've made a lot of effort to bring the States and others into our planning process now, especially in the last couple of years. If we can improve that process, we want to do so. We need the input of all parties.

A lot of the feedback that we get nowadays as we go around and talk to States and others about water quality problems is that we need to focus more on conventional pollutants, on biological resources, on ecological risks, and not just on specific chemicals, that we need to look more holistically at the water quality problems and use the criteria and standards program to protect those values and not just chemical purity of the water. So we're trying to move in that direction.

This is a real challenge for our criteria program. This is also expensive. It competes with a lot of other work, and yet we think it's very necessary, particularly as we identify non-point sources more and more as a matter of concern. The bill does direct us to focus on some of the non-point source pollutants, and that, we think, is appropriate.

With regard to the presumptive applicability for the numeric criteria, when we put them out, I think the bill has a very reasonable approach to it; the bill gives States an opportunity to go with their own approach, but provides that if they don't adopt their own approvable approach within a given period of time, then the Federal criteria would be applicable in that State. I think this is very important to us. We've devoted a lot of our resources and a lot of our energy in the last few years to establish criteria in those States that have not adopted their standards in a timely way.

States had almost 10 years to adopt numeric toxic criteria. Very few of them had done that until EPA threatened to promulgate for them. By the time many of these standards got in place, there were accusations that the criteria were out of date. There were problems in legislatures that delayed adoption in particular States. I think some kind of a Federal backstop here is necessary not only to keep the process moving, but also to allow us to use our resources to work on criteria instead of to promulgate for the States on a State-by-State basis, as we had to do this last time.

So we support that provision very much. We also support having public comment in our criteria development process on individual criteria. In fact, we do issue our criteria for public comment now. We are usually disappointed that we don't get more feedback in that process. Perhaps there's more we could do to bring the States and others into that process. We're certainly open on ideas on how to improve that.

Senator GRAHAM. Any other comments on this subject?

Ms. LANDMAN. I'm going to have to make one brief comment with respect to the mixing zone provision that's contained in the bill. The mixing zone concept is really a concept that says that a pollutant is not harmful if it's diluted with the water that's in the stream or in the lake or in the estuary. This is the concept that is inimical to the underlying thesis of the Clean Water Act, which is that dilution is not a solution to pollution.

It is true that States utilize the mixing zone concept now to allow the discharge of substances into their waters. It's a concept that we have a lot of problems with, and we can't support including in the legislation a provision that essentially gives a Congressional imprimatur to this idea, particularly with respect to toxic pollutants. If the provision were limited to conventional pollutants that don't have persistent or potentially bioaccumulative effects on waterways, perhaps there's room for discussion, but with respect to toxic pollutants, mixing zones are not acceptable.

Mr. SILLIMAN. Could I also comment on that? I think that the mixing zone has been an integral part of the implementation of the water quality standards, and I think it needs to continue, because we've made several comments here. Yes, there may be some toxicity. A lot of things can be toxic at some level, and we're looking not at what is happening right where the pipe goes in, but when it's mixed with a river, and that's the whole purpose of a mixing zone.

Second, there was some presumption that the toxicity as such is also related to bioaccumulation, and that's not necessarily true, and that certainly was not the basis, for example, of what underlies the water quality standards for metals.

Senator GRAHAM. Thank you very much.

Senator GRAHAM. Our next panel is going to focus on contaminated sediment. Ms. Beth Millemann of the Coastal Alliance; Mr. Frank Hackmann of the U.S. Chamber of Commerce; Dr. Morgan Rees, Deputy Assistant Secretary for Planning Policy and Legislation of the Office of the Assistant Secretary of the Army for Civil Works; and Ms. Prothro will be our participants in this next panel.

I understand that Ms. Millemann could not participate. Mr. Brett Hulseley is substituting for Ms. Millemann.

We have already touched upon the issue of contaminated sediment in our previous discussion. We know that there are great health risks from this contamination and that they involve pollutants that have entered the water decades earlier, settled into sediment, and are now being released back into the water. Some of those pollutants enter the water from discharges, some from other sources, such as air. We are told that EPA has had the authority for years to set water quality standards for sediment contamination but has never exercised that authority. This bill gives EPA clear authority to do so and starts them out by requiring EPA to develop not fewer than eight criteria sediment contaminations within four years.

Mr. Hulseley, I'd like to ask if you could give us your diagnosis as to what you think the problem is in terms of the way in which the current law has affected contaminated sediments.

Mr. HULSEY. Thank you, Senator, and thank you for addressing contaminated sediments. It's one of the most difficult issues in the clean water arena and in the Great Lakes.

My name is Brett Hulseley. I'm the Great Lakes Program Director for the Sierra Club, and contaminated sediments or cleaning up those sediments is our highest priority. We appreciate your leadership in the bill in dealing with these sediments and setting deadlines for sediment quality criteria for eight chemicals.

As we've heard here today, PCBs and dioxins are a major problem throughout the Nation, in the New York/New Jersey Harbor and many others, and as you can see from the map up here, virtually every harbor in the Great Lakes has contaminated sediment problems. Many of these harbors are clogged, and if you will flip to the next chart, we recently released a study trying to analyze some of the jobs at risk in the Great Lakes based on these contaminated sediment problems. The top threat in the study "Clean Lakes, Clean Jobs" was to the tourism area, which is one of the top economies in the Great Lakes. We estimated that there were \$69 billion at risk and almost three million jobs. Those are direct jobs. We didn't calculate indirect jobs.

Looking at other industries, in both the commercial and sports fishing industries, we estimated a \$4 billion industry with 89,000 jobs at risk. In the shipping industry—a speaker earlier spoke of competitiveness. Half of the U.S. steel is produced in the Great Lakes basin. Many of these harbors are so clogged that steel companies are losing millions of dollars a year because they cannot fully load their ore boats, bring them into Indiana Harbor and others. We calculated the risk there to be about \$3.5 billion and about 44,000 jobs.

This is a first attempt to understand what the total impacts of contaminated sediments are in the Great Lakes. We feel if we were

to extrapolate this to the other three coasts, simply multiplying these numbers by three—very simple mathematics—that we might be looking at somewhere over 10 million jobs and almost \$400 billion in jobs at risk throughout the Nation. That's a calculation we need to do. We haven't done it yet, but that's just sort of a quick sketch.

So we feel contaminated sediments are the biggest problem. We also tried to calculate some health costs, assuming between 10 and 20 percent of people drinking Great Lakes water might be subject—their health bill might be related to contamination. EPA has estimated that over 38,000 lifetime cancers are caused, for instance, from people eating Great Lakes fish, and this is an estimate we find that is cause for concern and cause for clean-up.

The study alluded to earlier by Mr. Baker dealt with the fact that children of mothers who eat Great Lakes fish tend to be born prematurely, they tend to have higher health costs when they are born, and after four years they tend to have lost memory and may lose up to five IQ points because of the PCBs that their mothers ingested before they were born. In fact, seeing the videos of some of these kids, many of them were unable to take the tests because they could not sit down and concentrate long enough at four years old to take these tests. I say that these kids make Bart Simpson look like a rocket scientist as to their inability to just sit down and concentrate.

So this is what we feel is the risk. This is a problem in every major harbor in the United States. There's current litigation in the New York/New Jersey Harbor. Several years ago, former Congressman Lehman from Florida testified to the problems they were having in the Miami River and the Miami Harbor on this as well.

I think the bill you have before you takes some really good first steps in dealing with it, especially in giving us standards for PCBs and dioxins, which we think are two of the worst problems. We'd also like to see standards for some heavy metals—mercury, lead, cadmium, and several others. We also need a national program to deal with this problem. EPA has been struggling under short staff to get five draft criteria out, which will hopefully be out this summer, but we need this to be a major focus of this Clean Water Act, and I think this is a great step we can take in moving forward.

We have been leaders in this in the Great Lakes. We've actually cleaned up one harbor, the most contaminated harbor in the Great Lakes that had PCBs of 500,000 parts per million, Waukegan Harbor, but unfortunately most of the clean-ups are proceeding right now under Superfund consent decrees and are very slow. There have been a lot of things said about the Superfund Program, but it's currently the best tool we have for cleaning up toxic harbors.

We'd like to take a look at the EPA and Corps relationship on ocean dumping as well. That's been a huge issue for us, and I assume folks from the Corps will talk about that later.

We'd also like to support the Metzenbaum-Glenn clean water reauthorization bill. They will take sort of our pilot programs that we've developed in the Great Lakes to clean up these harbors and move that the next step forward to full-scale clean-ups so that we can start creating some models and giving people in the Great

Lakes some hope that our fish are going to be safe to eat, our water is going to be safe to drink, and our Great Lakes are going to be cleaned up in our lifetime.

Thank you very much.

Senator GRAHAM. Thank you, Mr. Hulse.

Mr. Hackmann, from the perspective of the U.S. Chamber of Commerce, what is your assessment of the current state of contaminated sediment law and its implementation?

Mr. HACKMANN. Well, I think it's true that there are areas of the country that have contaminated sediment that is a real problem, but I don't think, from our perspective, that the solution to that problem is another national command-and-control, prescriptive kind of approach. I think that the localized areas of sediment contamination can be dealt with under current authority, certainly on a first-step kind of a basis, and I do not see the need for another whole program on top of all the other programs that are already there.

Two of the chemicals mentioned, one has been banned for over 20 years and the other has never, to my knowledge, been intentionally manufactured in the United States by anybody—that being PCBs and dioxin. So I just don't think that the problem lends itself to the kind of solution that's envisioned.

I also think there's a real danger, if you do too much aggressive movement in a harbor, of making things worse, not better. I don't think you necessarily make things better if you disturb the sediment.

Senator GRAHAM. Ms. Prothro, it's been stated that EPA has had the authority, but it has not been exercised. Does EPA agree that it has the capacity to deal with this issue and has failed to do so, and if so, why?

Ms. PROTHRO. We think we do have the authority under current law to promulgate criteria for sediment quality. We have not done so as yet, but we have been working for the last several years to develop a methodology and specific criteria. We are hopeful that we'll be able to establish those even without specific authorization in the law, but we would welcome both a clarification and support specifically from Congress on our moving forward on sediment criteria. We will be moving forward on that in any event, however.

Sediment contamination really is a case of the sins of the father being visited on his sons and daughters, I suppose. It's really one where we're facing tremendous costs in "in situ" contamination that may not be readily remediated. Although we have some authority under the recent Water Resources Development Act amendments, which will help us by authorizing some inventories to be developed and some other work in the sediments area, I'm not sure that we've been able to identify any legislative solutions to this problem. I think there are many, many practical problems that we still have to work on that are going to take a long time to solve.

One suggestion we would have for perhaps an addition to the bill would be some specific authorization for EPA to help States address the health risks of fish contamination associated with sediment contamination. EPA could do this by establishing some basic guidelines as to how fish consumption advisories should be developed and communicated. It's unfortunate that we would be in a po-

sition where we have to warn people about health risks rather than simply solving those health risks, but in reality I think we have to face up to the fact that it's going to be many years, perhaps lifetimes, before we can actually solve this problem in many of our waterways.

We certainly would be happy to work with the subcommittee on other ideas that might be suggested by others as to how we could improve our authority in this area.

Senator GRAHAM. Dr. Rees, it's been suggested that one of the problems here is that solving the issue of contaminated sediment may itself create additional problems in disturbing the water column. What is the experience of the Corps of Engineers in terms of technological options in terms of how to deal with this problem?

Dr. REES. During the past 20 years or so since the original passage of the Clean Water Act, the Corps of Engineers has spent over \$100 million on researching questions like this on what the impacts are of dredging and disposal of dredge material. There are occasions where disturbing the material causes resuspension, and we've studied those and we've dealt with those in many instances. By and large, we find those effects to be very temporary and transient, just during the dredging episode. We have tested the circumstances by comparison with the surrounding water and find that the effects are physically limited to the dredge site and don't last very long.

There are a lot of other problems, though, that continue to be addressed. Focusing on just one aspect of the dredging or disposal option, we believe, is not good science. We support very, very strongly, and frankly have since 1972, a cross-media approach to the analysis of the effects of dredging and disposal. You can't simply look at what happens in the water without also having to consider what happens in other alternatives in the way any particular project is carried out.

We note with great interest and support the discussion in the proposed legislation that deals with cross-media evaluations and to find out what really, in a broader environmental context, is the best course of action.

Senator GRAHAM. At an operational level, there's been some concern by the Corps of Engineers when it is engaged in a maintenance project, such as a standard harbor maintenance of depth of channel project, as to whether it has the authority to extend that to also include the elimination of contaminated sediments within that harbor. Could you talk some about how the Corps has seen its authority, both legal and financial, to engage in these sediment removal projects?

Dr. REES. The Water Resources Development Act of 1990 (WRDA 90) provided the authority that you're referring to, and in fact that authority was originally provided in the 1972 Clean Water Act to the Environmental Protection Agency, not to the Army Civil Works Program. The WRDA 90 authority is a duplicate of authority that EPA has had for 21 years. We have had it for three years. There has not been any funding for that program in either agency, certainly not in the Army and, to the best of my knowledge, not in EPA, either.

Let me add a point there. We have provided guidance to the field offices of the Corps that where contaminated sediments exist out-

side the navigation channels, the Corps should proceed with removal if they can show that there is a relationship to that removal with the interests of navigation. The basis for this position is that the funding for the dredging program comes from the Harbor Maintenance Trust Fund, and that's all contributed by the maritime interests. So where we can show a relationship between the objectives of the work and the source of the money for the program, we've told the Corps field offices that they should proceed.

Senator GRAHAM. Are there any other comments on this issue?

Mr. HULSEY. A couple of comments, just to respond to Mr. Hackmann's comments about PCB and dioxin. As Mr. Baker pointed out before, current NPDES discharges in the Great Lakes are releasing about 290 pounds of new PCBs into the lake every year. A quick calculation shows that that's enough to contaminate 195 million pounds of fish at the action limit of two parts per million. So in addition to controlling new sources, we have to eliminate current sources.

Right now many dredge projects that the Corps is supposed to be involved in the Great Lakes and the New York/New Jersey Harbor and others cannot proceed because of either legal entanglements over the contaminated sediments issue or just an inability to deal with the toxic pollution. So that's why we want to work out a clear, practical national program to help deal with these issues and give us something that the courts can work with, the environmental community can work with, and provide us a degree of scientific certainty in the States with these clean-up plans.

Senator GRAHAM. What is the nature of the legal impediments to your carrying out a removal of contaminated sediments?

Dr. REES. Without knowing a specific case, it's hard to say. As we get into each case, we find that there are very many factors that are different, and we really don't have any broad precedent that we can follow in how to deal with these cases. I guess the bottom line legally for clean-up of material is there's no question that EPA and Army both have the authority to do that. The question is, what do you do with the material once you dig it up? Where do you put it, and what are the legal implications of getting rid of it? And we can't really tell that until we get into the individual case and see what the area is surrounding the dredging site.

For example, New York City has been mentioned, and there is a pending lawsuit there, so we need to be careful about how we discuss that. But it's clear from the record that for many, many years the Corps, the EPA, and others have spent a lot of time and a lot of money searching for practicable alternatives to the disposal options there, and no matter which alternative is selected or which alternative is analyzed, we find that there are serious legal impediments for implementing each one.

This, again, gets back to the cross-media analysis that we believe is critical to the success is solving this problem one way or another, because if you say, "Well, you can't put it in the water," well, then, you start to look upland, but all the land regulations say, "Well, you can't put it upland," and the air regulations say, "Well, you can't burn it," and it's a vicious circle that we've been chasing around for many years trying to find some way out of it.

I'd like to follow up on a comment Mr. Hulseby made here, if I may, that I think relates to this question. There have been some serious problems in the Great Lakes with disposal of dredge material, and there's no question about it. In 1970 an act was passed that allowed the Corps of Engineers to build confined disposal facilities to contain all the contaminated dredge material. The authority under that act has lapsed, but the notion was that the authority would extend for a period of 10 years, during which time the quality of the sediments would be improved through water quality management practices. Well, that didn't happen, and we find that the sediments are still polluted.

The bottom line of all that is that the maritime interests are faced with the problem of dealing with the pollutants that are, by and large, caused by other people, and the other people just walk away from the problem, and the maritime interests are left with dealing with that problem. This was a real difficult problem to handle. I think we have begun to make some progress. In fact, we're quite optimistic.

We've developed a relationship with the State of Ohio, the Port of Toledo, the Environmental Protection Agency, and the Corps, and we've been working for several years now on a much broader problem-solving approach and not just looking at handling the dredge material. We're looking at what the objectives of the water quality standards are and how the navigation interests fit into that. We're looking at where the sources of the different pollutants are and what the State and Federal agencies are doing about managing those sources, and we're very optimistic that that's going to lead us somewhere in the future—not in the next year or two, but maybe 5 or 10 years down the road—to seriously reducing the problem that we face today, and I hope I'm right. We're optimistic, and we're going to continue on that.

Mr. HULSEY. The Metzenbaum bill would continue the funding for that relationship between the Corps and the EPA and citizen groups, and we support that as well.

Senator GRAHAM. Any other comments on this subject?

[No response.]

Senator GRAHAM. If not, thank you very much.

Senator GRAHAM. Next we are going to discuss anti-degradation policy. Mr. Hackmann is going to continue to join us, representing the U.S. Chamber; Ms. Prothro; and then we'll be joined again by Ms. Jessica Landman of the National Resources Defense Council.

The anti-degradation provisions of the Clean Water Act are designed to keep clean waters clean—that is, to resist the temptation to allow pollution of clean or pristine waters down to water quality standards applicable to less pristine waters. We've heard that many States have not implemented this policy. The bill directs the States to do so. The bill also declares certain waters, including those to be outstanding national resource waters, which cannot be degraded under the Clean Water Act.

In our earlier discussion on pollution prevention, it was stated that there were some inhibitants to effective pollution prevention, and one of those was the anti-degradation provision in the Clean Water Act. I wonder if anyone would care to comment as to the

degree to which this provision constitutes a barrier to pollution prevention on a voluntary basis by industry.

Mr. HACKMANN. I'll go first, if nobody else wants to volunteer. Senator GRAHAM. Mr. Hackmann?

Mr. HACKMANN. From industry's perspective, I think the reason it's a barrier is this: Oftentimes in pollution prevention, you are substituting a material. In other words, you're reducing one thing, but maybe you're putting in something else. If that something else wasn't in your permit previously because you didn't use it, and now you have to modify your permit to discharge it, even though clearly the overall environment and the cross-media impacts and everything are clearly better off, on a strictly speaking parametric analysis, more of this chemical is going to be coming out, and read in its most literal and negative kind of way, if that increases your baseline concentration, that can be viewed as degradation of the water quality, and you don't in effect get a credit for reducing the other thing that you reduced. I think in a capsule form, that's our concern.

Senator GRAHAM. Ms. Landman?

Ms. LANDMAN. I'd be happy to try and respond to that. In a certain sense, it can be said that protection of outstanding national resource waters, which is one of the components of the legislation that we do strongly support, would prevent someone from taking an action that would degrade those outstanding waters, and there can be circumstances in which a prohibition on any discharge is appropriate. Now, for an existing facility to be discharging to an outstanding national resource water and have that problem arise, that's a little bit difficult for me to conceive of, because by definition those waters are essentially pristine, and no existing factory is going to have a problem wanting to increase its discharge.

With respect to existing facilities that would like to experiment with pollution prevention, the anti-degradation regulations that EPA now has don't say, "Never, no, no, will you be allowed to increase the discharge of a substance." What they do say is that if you can make a very strong case that the degradation of that water is necessary to allow economic and social development in the area where those waters are located and you can show that you're doing everything else that you need to do to comply with the Clean Water Act regulations and so forth, then you can make a case for an increase up to the point where water quality standards might be violated.

So I believe that the anti-degradation provisions of the regulations do establish appropriate limitations on the types of degradation that can occur, but also have adequate flexibility to allow true pollution prevention efforts to go forward if the case can be made.

One of the big problems that we do face in implementing anti-degradation, though, is that there is no explicit discussion of the issue of anti-degradation in the existing Clean Water Act. Although it is mentioned—a mention of the concept was added in 1987—there is no clear mandate in existing law that tells EPA that this is an important responsibility, to carry it out, and to help the States carry it out. That is one of the reasons that we welcome the addition that S. 1114 would have with respect to anti-degradation

and with respect to addressing the issue of outstanding waters and their need for protection.

Senator GRAHAM. Ms. Prothro?

Ms. PROTHRO. Senator Graham, I've been joined by Bill Diamond from our Water Office of Science and Technology. I'd like to ask him to comment on this issue.

Mr. DIAMOND. In response to your question about whether or not we think anti-degradation is a barrier to pollution prevention or experimentation with new chemicals, we think that the existing process examines whether or not there is a potential degradation. But, as Ms. Landman pointed out, we don't think it's a ban or a mandate that would prevent experimentation with new chemicals. There are mechanisms under the current law and regulations that allow us to look at those new additions to determine if there is degradation; if there is degradation, then there is a review process on whether or not it should be allowable. But it's not a ban in and of itself.

Senator GRAHAM. One of the reasons for the language that's in this bill is the allegation that many States have not implemented the national policy relative to anti-degradation. What has caused the States to be reticent to implement this policy, and do you think their reasons have been sufficient? And if not, do you believe that this legislation would be a sufficient remedy?

Mr. DIAMOND. There's a number of reasons why anti-degradation hasn't been utilized as much as it can be to maintain the goals of the act. One of them is just the historical focus of the program. The focus of the program recently has been on the adoption of water quality standards for toxics. As we get into the implementation phase of that, we expect that there will be more anti-degradation issues coming to the fore.

An example of that is the regulation that the agency recently proposed for the Great Lakes Initiative. Anti-degradation is one of the central features there and is getting a lot of discussion and debate. We think anti-degradation can be utilized more, and we think there has to be more cooperation with the States to achieve them.

One of the areas that the bill does address that States, I think, have underutilized is the designation of outstanding national resource waters, or ONRWs. There have been some designations by States. It hasn't been as widespread as maybe some would like. One of the problems there is the prescriptive nature of ONRW requirements. Once you have an ONRW, there can be no new or increased discharges at all. That means a fairly rigid locking away of those water bodies. Some of the States want to grant additional protection, but are unwilling to put them away permanently, so to speak. I think they've been creative in trying to come up with solutions that provide additional protection, and we're trying to work with them in our regulations to make those more workable.

Ms. LANDMAN. One key reason why States have hesitated to step to the fore in this area, I believe, is that they have felt a need for clear direction from the national level. At different points along the way in the past five to seven years, EPA regional offices and EPA headquarters have begun the process of developing national guidance on how you go about implementing an anti-degradation program. That guidance has never quite blossomed into a full na-

tional guidance on the part of EPA, and we think that kind of leadership from Washington, not dictating to the States exactly how to run their programs, but giving them clear guidance on what types of things they need to consider and that sort of thing, would be extremely helpful in moving this program along.

In particular, an area that needs clear Federal direction and guidance is how you go about implementing this very important concept for land uses and activities that disturb land, that cause polluted runoff problems. For the most part, to the extent anti-degradation has been implemented, it has been with a focus on discharge permittees. If somebody comes in and they say they want a new permit, that's the trigger for an anti-degradation review.

Since so much of our existing and threatened problems from water pollution have to do with land use activities, from agriculture to new developments of resorts and so forth, it's important that in protecting pristine waters we have clear guidance from EPA on how States and localities should think about preventing pollution from runoff sources as part of an anti-degradation effort.

Mr. HACKMANN. I think we come to this issue from a slightly different perspective. From our perspective, first of all, the anti-degradation concept basically sets a tighter water quality standard than the water quality standard that would otherwise apply. In basic terms, it says if the water is better than the water quality standard, you have a very high burden to overcome to allow that water quality to get, if you will, worse, even though it's still within the standard.

Speaking from the State perspective, although I don't currently work for State government, I think one of the reasons the States are reluctant to adopt rules is that they've learned, painfully in some cases, that if they adopt rules based on guidance, they may not be able to change those rules if EPA later changes its guidance. A number of States got tripped up on this in the Air Act, some in the Water Act, some in other areas, and I think that their reluctance is understandable until there's clear-cut guidance.

Finally, I think that these are areas better left to local decision makers about how they want to run their community and represent the values and the cultures and the local governments of those areas and shouldn't be mandated from Washington.

Senator GRAHAM. I want to come back a moment to the issue of the degree to which anti-degradation has been a barrier to voluntary pollution prevention. Since we've had some States that have adopted anti-degradation standards and others that have not, is there a difference in the degree to which companies have voluntarily engaged in pollution prevention practices as a function of whether they are in a State that has or has not adopted anti-degradation standards?

Ms. PROTHRO. Senator, I don't think we are aware of any evidence that is the case. In fact, I think you could just logically argue that an anti-degradation provision might encourage pollution prevention in order to allow for more development—in other words, the more a pollution is reduced through a prevention approach, the more likely it is that other development could be permitted under the anti-degradation rules. So I'm not sure I understand that.

I think perhaps that comment was going to the concerns that have been raised about a different provision of the act, which is anti-backsliding, which is a somewhat different provision that applies directly to effluent limits in a permit. There's been a lot of concern that maybe that provision was unduly restrictive and didn't allow any flexibility even when water quality wasn't threatened.

I think that EPA's interpretation of anti-backsliding is not well understood. We interpret it in such a way that it is not really creating that kind of a problem, but I have to admit we've been a little slow in getting that out, so that people can see it in their regulations and understand how it works. But that is a somewhat different provision of the act.

Senator GRAHAM. Are there any other comments on this issue?

[No response.]

Senator GRAHAM. If not, thank you very much.

Senator GRAHAM. We have two related subjects remaining: pretreatment and domestic sewage exclusion. Since those are closely related and there's an overlap of several of the participants, I'd like to ask if we could discuss those together. Ms. Landman will continue, Mr. Hackmann, Ms. Prothro, and Mr. James Batchelder, Vice President, Environmental Affairs and Technical Services, Koopers Industries, Pittsburgh, Pennsylvania, representing the American Wood Preservers Institute.

Senator GRAHAM. Again, I'd like to start with a question of what is the current problem with the pretreatment law. Under the current law, publicly owned treatment works, which are designed to treat conventional pollutants, nonetheless receive toxic pollutants that they, in some cases, state they are incapable of treating. As a result, many toxic substances are released into waters or the air or into sludge.

The bill attempts to address this problem in two ways. First, it provides that pretreatment standards for toxic pollutants must be equal to the standards for dischargers directly into water. The second allows permit officials to impose pretreatment requirements on industrial users, even if the source is not otherwise subject to a pretreatment program. Whether to strengthen pretreatment provisions of the act, there is concern that EPA has not provided adequate monitoring or enforcement of indirect discharges to publicly owned treatment works and that those works are not designed to treat some toxics that are being discharged into them.

I wonder if we could again get your assessment of what is the current problem as it relates to the pretreatment or lack of pretreatment of discharges before they are entered into a publicly owned treatment work.

Mr. Hackmann?

Mr. HACKMANN. From the perspective of the Chamber, I'd like to respond separately to the two key concepts you described—first, the concept of any discharge of the toxic material to the sewers should meet the same standard as if that discharge were discharged directly to a receiving water. We are totally opposed to that. We think it's bad policy not only for industry, but it would also be very bad policy for cities, for the people that run the treatment plants, because as a practical matter, if Congress would pass

a law like that and it would survive the challenges that would come to it, I think that the way companies would try to comply with that law would be to cease their discharge entirely to the sewer and that when they did, that would deprive the city of the revenue stream from running a sewer system.

And it proliferates treatment in very small, decentralized areas where then, because the second law of thermodynamics still applies that you have to take the stuff somewhere, you then have to take it somewhere else. So on that first point, we do not agree with that concept.

On the second point, we believe that the pretreatment program in the current law is a very comprehensive program, that there's ample authority for EPA and the States and the municipalities to deal with these issues, and at least based on my experience as a practitioner in the field, they're do so aggressively, setting pretreatment standards to protect pretreatment operators' health and safety, sewage sludge, and whatnot.

Senator GRAHAM. I wonder, Ms. Prothro, what is your comment on the statement that existing law gives to publicly owned pretreatment works sufficient authority to address the problem of necessary pretreatment?

Ms. PROTHRO. Well, I think current law is very good, but it could be strengthened in some ways. One of the things that we'd like to see is authority specifically for EPA, in those communities where we have responsibility for running the pretreatment program, to do what localities and States can do. That is, to issue permits, sometimes called control mechanisms, to individual facilities to make sure that they have effluent limits that are enforceable.

There are a number of other things that we'd like to see improved in the establishment of the categorical pretreatment standards. These are related somewhat to the effluent guidelines process, and there are a lot of things about the bill that I think will help us in that regard. For example, we've sometimes had to go through some complex and almost impossible analyses on pass-through and interference of pollutants that are going into the sewers before we can adequately regulate them. We think a better way would be to allow us to identify pollutants that biodegrade in the sewage treatment plant and perhaps adjust pretreatment standards for those, but, otherwise, to apply best available technology requirements across the board to industries discharging to sewers.

We think this is important to protect the infrastructure of the POTWs, to protect the quality of the sewage sludge, which is a reusable resource if the quality is maintained, as well as to protect water quality and worker health and safety.

So there are a number of improvements we think could be made in the program, and we're very proud, I have to say, of what we have been able to achieve in this program, because it is one that we have implemented on a shoestring over the years. I think an awful lot has been accomplished, and a lot of credit goes to the States and local governments that have helped us to implement this program, especially our local government partners, who often aren't recognized for the good work that they do in this regard.

Senator GRAHAM. Ms. Landman?

Ms. LANDMAN. I believe it was in your opening statement this morning, Senator, in which you noted that a significant percentage of toxic substances discharged to waters are actually discharged to sewage treatment plants, even more in fact than are currently discharged to waters. And the Toxic Release Inventory is especially deficient in telling us how many toxic substances are going to sewage treatment plants, because so many of those dischargers are too small to fall within the reporting requirements of the law.

So from the studies that EPA has done, the evidence is quite clear that probably the Release Inventory greatly underreports the quantity of those substances going to sewage treatment plants.

You also noted accurately that sewage treatment plants are designed to treat conventional pollutants, and every time that EPA has gone back to study how well sewage treatment plants can be counted upon to deal with the toxic substances that reach them from the industries as well as commercial and residential users of those facilities, they find very inconsistent levels of treatment, a great deal of variability in treatment with respect to those toxic substances, both among facilities and even within a given sewage treatment plant from day to day. So it's really not appropriate to rely on a sewage treatment plant to address toxic pollutants.

In addition, in many respects, the kind of so-called treatment that a sewage treatment plant is providing for a toxic substance really only moves it from one medium to another. Specifically, metals that go to a sewage treatment plant don't get degraded by the treatment process. Instead, they wind up as sludge contaminants. A lot of volatile organic compounds wind up as air pollutants through the very efficient air distribution mechanism that a sewage treatment plant's aeration basin provides. It's just a really efficient way to cause an air pollution problem and the illusion of treatment.

Therefore, we strongly support a focus on allowing the pretreatment standards to differ from standards that would apply to direct discharges only with respect to those substances that can be demonstrated to be in fact biodegraded at a sewage treatment plant. That is a very appropriate way to allow the sewage treatment plants to do the jobs that they are constructed to do, which is to treat conventional pollutants that may originate with industry, commercial, or residential users, and then to remove from them the responsibility for doing something that they really are not properly designed to do, and that is to deal with toxic pollution problems.

So we think that that's an important change in the law, and we support it.

Senator GRAHAM. Well, as I understand it, the current law is that if a local sewer plant is receiving this type of industrial discharge, they have the authority to go to the plant and set the standards that must be met before the plant can put its discharge into the city system. Is that correct?

Mr. HACKMANN. Yes.

Ms. LANDMAN. Yes.

Senator GRAHAM. That would seem to be—since the plant has a great interest in what they are required to process and, on a site-specific basis, have an understanding of what their technological

capabilities are, it would seem that system would be an adequate one in terms of allowing the local plant, based on its local conditions, to set standards for discharge. Why isn't that system working?

Ms. LANDMAN. I think that there are two principal reasons why we have problems with the pretreatment program even though that authority exists. First, and I don't mean to belittle the very good pretreatment programs that exist in some cities, but in a sense it is asking the fox to guard the chicken house. The principal constituency for a sewage treatment plant may be those big industrial dischargers in their community; the pretreatment program, asks the sewage treatment plant to slap the wrists of and put limitations on their best customers, and no product seller likes to be the one to tell their customer that they're wrong.

The General Accounting Office has studied the pretreatment program's enforcement component and has found this to be a significant reason why sewage treatment plants that are responsible for managing these programs are reluctant to take action when they have a problem. That's one reason.

The other reason, I think, is parallel to the one that Mr. Baker alluded to when he described why it's hard for State permit writers to deal with all the exigencies of permit writing with respect to direct dischargers. It's a very big job. Their job is made a lot easier if national standards are set by EPA that establish a really good floor for those dischargers so that they don't have to, on an individual facility basis, write the local limits that they would have to set if those standards weren't good at the national level.

Senator GRAHAM. Mr. Batchelder, do you have any comments on this?

Mr. BATCHELDER. I'm here mainly to address the domestic sewage exclusion, but my experience—we've recently gone into a number of POTWs, and my experience is that the permit requirements to gain access are very stringent, and all cases include treatment and almost all cases include secondary and tertiary treatment before they discharge. Therefore, they do not pose a threat and are amenable to further treatment at the POTW.

Ms. PROTHRO. Senator, if I may, I just wanted to make the comment that even EPA has trouble technically doing the pass-through and interference analysis that is required. It's very difficult sometimes with the dilution in sewage sludges and effluents to identify exactly what's happening.

I just want to reinforce what Ms. Landman said about the real challenge that this presents to local communities that would have to base their limits on this kind of analysis when, even with our extensive technical resources, we still have difficulty doing it. So I think the localities do rely on our national standards. In fact, they've sued us in the past to require us to promulgate more national standards to help them to protect their sewage treatment plants, and that's one of the reasons that we do support this approach.

Senator GRAHAM. The second topic, which is really a subset of the pretreatment issue, is the question of domestic sewage exclusion. The bill attempts to close what some have seen as an omission in the current law by providing that the domestic sewage exclusion

only applies where the pollutant is covered by a pretreatment standard that is promulgated or is scheduled to be promulgated within eight years or is covered by a local limit. That is, a hazardous waste substance would not get the benefit of the exclusion from RCRA unless it was a substance that is covered by a current or soon-to-be-promulgated pretreatment standard.

Mr. Batchelder, what is your assessment of how the current domestic sewage exclusion provision is operating?

Mr. BATCHELDER. The current domestic sewage exclusion works well and gives us or someone with a listed waste water access to the POTW, which is very critical to our industry, and the proposed language would basically cut us off from access and the use of the DSE because of the prohibition for discharging hazardous waste constituents, which we were recently in 1990 listed as hazardous, our waste waters.

I do not see the domestic sewage exclusion as a loophole or unprotective. When we get access, we have to have permits. My experience has been, because we've just done this in the last couple of years, we have had to build substantial pretreatment facilities in order to gain access. There are strict limits imposed upon us, and they're monitored prior to discharge. They're biotreated down, and I would submit that the system is protective and that there is further treatment at the POTW and monitoring, and it serves as a back-up system, since you get two shots at these materials.

We're largely in rural communities. There is an economic benefit to that POTW, and I think our withdrawal or exclusion would be damaging in these small communities.

Senator GRAHAM. As I understand it, the problem has been stated that not all hazardous substances that are able to take advantage of the domestic sewage exclusion are currently covered by pretreatment requirements under the Clean Water Act, and that results in the local treatment plant which receives these hazardous wastes as having to assume the full burden of treatment. That does not sound the way—

Mr. BATCHELDER. I don't see it as the full burden of treatment. We accept the burden of treatment to the limits that they set, and they usually call in third party consultants to deal with their own system. In fact, sometimes we have sponsored and have paid for that in order to gain access. So I do not see that as factual. There may be instances, but in my experience that is not true. We go all the way—as I said, in some cases, we have actually treated down to tertiary treatment in meeting their discharge limits.

Senator GRAHAM. Ms. Landman?

Ms. LANDMAN. Senator, I think maybe there is a confusion as to exactly how your committee's legislation would in fact narrow the domestic sewage exclusion, because as I understand the bill, what it says is that if there is no pretreatment standard or no local limit, essentially a regulatory free ride, then the exclusion is eliminated, and that's entirely appropriate. But it also says that if the sewage treatment plant has established a local limit, then the exclusion would still be available, because that local limit would protect the sewage treatment plant and the workers who work there and the water body to which the sewage treatment plant discharges. That's my understanding of how the provision is crafted.

If that's the case, and if facilities that Mr. Batchelder is describing do in fact have such limits, my read would be that the exclusion would still be available. The problem is not facilities where somebody has thought through the potential hazard that would be posed by the substance being discharged to the sewage treatment plant. It's the ones where that exercise has not been undertaken and where no national pretreatment standard exists for the substance of concern.

Senator GRAHAM. I think Ms. Landman has accurately described what the proposed legislation would require—that is, in order to benefit by this exclusion, you would either have to meet one of two tests: either be covered by a local limit, or where there is a pretreatment standard that is either in effect or is scheduled to be in effect within eight years. Do you think those are reasonable—

Mr. BATCHELDER. I read a prohibition on discharge of hazardous waste, and there's a quirk in the regulation in our industry that our waste waters are listed as hazardous waste. So regardless of concentration, that's what I read, and if that's the fact, then that is a problem.

Senator GRAHAM. I do not believe that it's intended to set an outright prohibition, but rather to be a requirement that you have to meet one of these two tests—either have a pretreatment standard or covered by a local limit—in order to take advantage of the domestic sewage exclusion.

Ms. PROTHRO. Senator, we have some concerns about this provision, and I think the question you just raised about whether or not the prohibition on hazardous waste applies across the board is one of them. We'd like to look at that more carefully. Certainly, we would endorse the intent behind this, but I think the legal relationship between RCRA and the Clean Water Act is a very complex one.

I have to admit we're also concerned that when we're regulating on a risk basis, we don't particularly want to have industries coming in to us—and I don't think the cities do either—saying, "Please regulate us just so we can be excluded from RCRA." We'd like to be able to set our priorities in a way that's based more on an objective evaluation of what makes sense in terms of protecting water quality and protecting POTWs. So we'd like to work with you some more on this particular provision to address that.

A further refinement on Ms. Landman's description of the exclusion, though, I think would be that as I read the bill, we would have to include in a categorical standard or a local limit the exact pollutant, not merely provide that industry would be regulated in other words, the exact pollutant would have to have been regulated in order for the exclusion to be relieved. A lot of times when we look at industries and regulate them, we select pollutants for regulation based on the ones that we think are mostly of concern, and we may not list every single pollutant in a discharge, but we think we've nevertheless addressed the problems in that effluent. So that's another concern that we'd like to work with you on.

Mr. BATCHELDER. That's very, very important to us that, if that were to come to pass, because we do not have standards for zero discharge or direct discharge, going back to standards set in 1972, we would have no alternative. We've built plants, we're into the

POTWs, we're pre-treating, and as I read this now, we would be excluded. So we're talking about—I don't see any alternative, and, therefore, we're talking about jobs, a number of jobs in a number of small communities.

Senator GRAHAM. Well, I'm glad that we surfaced this maybe different perception of and interpretation of what the problem is and what the suggested solution is, and we will direct our attention to this.

I think it's interesting that we've concluded this hearing on this subject, which deals with the interrelationship of the Resource Conservation and Recovery Act and the Clean Water Act. It somewhat closes the circle, as we began with some discussions on pollution prevention and how that might relate to the Clean Water Act and particularly the Clean Air Act as alternative mediums of disposal.

I think one of the themes that has come throughout this series of very interesting insights into the Clean Water Act toxic provision is the interplay between the various environmental laws and the necessity of setting some standards and ways of looking at the relative benefits and potential public and environmental threats caused by these various toxic substances and their method of handling and disposal.

Again, I appreciate, to all of you who have participated in the hearing today, your very fine contribution to our understanding of these complex issues. We will be meeting Wednesday, July the 14th, and we will be discussing non-point pollution issues.

Thank you very much, and best wishes for the 4th of July.

[Whereupon, at 12:39 p.m., the subcommittee adjourned, to reconvene on Wednesday, July 14, 1993.]

[Statements submitted for the record follow:]

TESTIMONY OF MANIK ROY, POLLUTION PREVENTION SPECIALIST,
ENVIRONMENTAL DEFENSE FUND

Introduction

Chairman Graham and members of the Senate Subcommittee on Clean Water, Fisheries and Wildlife of the Senate Committee on Environment and Public Works. My name is Manik Roy, Ph.D. I am a Pollution Prevention Specialist with the Environmental Defense Fund in Washington, DC. The Environmental Defense Fund, a leading, national, New York-based nonprofit organization with over 200,000 members, links science, economics, and law to create innovative, economically viable solutions to today's environmental problems.

Thank you for the opportunity to testify on toxic pollution prevention¹ issues addressed in S. 1114, the Water Pollution Prevention and Control Act of 1993. The provisions of S. 1114 addressing pollution prevention are truly path breaking in building prevention into the core of one of our nation's most important environmental laws.

As this nation works to rebuild industrial competitiveness and to provide greater protection for our water resources and the overall environment, pollution prevention is the one policy necessary to achieve both goals. U.S. environmental laws have traditionally relied on "end of the pipe" technology to control toxic pollution. For the past twenty years, we have attempted to capture, control or contain pollutants after producing them.

But it is becoming increasingly clear—to the public, to industry, and to government—that front-end pollution prevention is the most cost-effective way to protect human health and the environment. This realization is reflected in the pollution prevention laws passed by the U.S. Congress and 49 states, and in public statements from all sectors of society (see Attachment A).

Nevertheless, we still have far to go before prevention is practiced as well as it is preached. No doubt some companies have taken important steps towards preventing pollution. However, this apparently remains the exception rather than the rule: the

1991 Toxics Release Inventory (TRI) showed that “[e]ven though emissions of chemicals are decreasing, we don’t see a similar downward trend in waste generation [prior to recycling, treatment, and disposal]. The data projected [by industry] for 1992 and 1993 suggest that generated waste will be flat or will even increase slightly.”²

While these industry projections show industry not yet embracing prevention, government attempts to promote prevention are still in their infancy as well. The U.S. Environmental Protection Agency (EPA) has certainly taken important steps to establish a framework for pollution prevention, but only a tiny fraction of the Agency’s budget is specifically linked to prevention—hardly a sign that prevention has entered the mainstream of EPA life.

A System that Puts Prevention First

Without a doubt, the end-of-pipe Best Available Technology (BAT) approach has been responsible for tremendous progress in protecting human health and the environment. No doubt the BAT approach will remain an essential component of our environmental protection strategy. But we approach the limit of what BAT can do alone. Putting prevention first will require a strategy with three important characteristics.

First, we must foster the use of site-specific pollution prevention technologies and practices that surpass Best Available Technology in protecting the environment.

The BAT approach bases standards on pollution control technologies (and sometimes pollution prevention technologies) that can be used by every company in an industry category. By definition, the BAT system can not account for pollution prevention practices that could be used only by a few of the companies in the industry category, even if those practices better protect human health and environment.

Because so many pollution prevention practices are site-specific, rather than universally applicable, we can not require their use through BAT-based rules and permits. EPA must use other tools to lead companies to investigate and choose for themselves the available prevention options.

Second, we must stop leading or allowing industry to play the “toxic shell game”—shifting pollutants from one environmental medium to another, or by pushing human health and environmental impacts to other parts of a product’s life cycle. When EPA sets standards for only one environmental medium it is allowing—and perhaps inadvertently promoting—the use of pollution control technologies that may merely shift the point of human health and environment harm, rather than reduce the harm, and all at great expense to industry. We must stop the toxic shell game.

Third, we must counteract the tendency to create an environmental compliance “priesthood” within industry, which blocks industry from distributing the responsibility for environmental protection to all employees.

Industry has responded to the environmental regulations by creating an environmental priesthood specializing in environmental requirements, learning the special languages and becoming attuned to the unpredictable events that characterize that any one firm’s regulatory environment. We can sympathize with industry’s desire to create environmental specialists and if we are content to allow companies to rest once they have met the minimum requirement—i.e. installing a universally applicable, end-of-pipe technology—then we can be satisfied with a system that creates such a priesthood.

However, companies are best able to prevent pollution only when they can engage top management, marketing staff, research and developing staff, production staff, and all others in the firm in environmental protection. Take, for example, the Federal Toxics Release Inventory³ (TRI), a community Right-to-Know program sometimes also known as the “CEO Right-to-know Program”. Requiring companies to publish information on their toxic releases broadened awareness of toxic chemicals to industry employees outside environmental departments, often resulting in dramatic voluntary reductions in those releases.

The pollution prevention-oriented provisions of S. 1114, specifically the sections on pollution prevention planning (section 205) and point source technology based controls (section 201), take important steps to build all three characteristics into our environmental protection system.

Pollution Prevention Planning

Because of the great diversity of industrial processes, EPA does not have the ability to dictate the exact pollution prevention strategy for each company through the BAT process. The responsibility for identifying those pollution prevention approaches which allow a company to surpass the minimum BAT standards must lie with

the company itself. A pollution prevention planning requirement, such as that in section 205, essentially formalizes this responsibility.

In developing a pollution prevention plan, a company should evaluate its pollution prevention options, leading it to do at least three things that most companies today do not do (see Attachment B):

- inventory the flow of toxic materials and wastes through its production units;
- estimate the costs associated with the use of toxic chemicals or pollutants, including the cost of pollution control, waste management, employee protection, and insurance; and
- identify pollution prevention options, assess their technical and economic feasibility, and select those appropriate for Implementation.

EDF urges the subcommittee to study Senator Lieberman's Hazardous Pollution Prevention Act (S. 980) as the subcommittee discusses this issue. There are also a recent EPA guidance on the elements of a waste minimization program ⁴, and several state pollution prevention planning laws, particularly in Massachusetts, New Jersey, Washington, and Oregon, which might provide interesting lessons as well.

Point Source Technology Based Controls

Current EPA Best Available Technology (BAT) standards are based on the BAT technology's "best" performance in a single medium. In developing these standards, EPA typically neither accounts for environmental impacts in the other media, nor prohibits use of technologies that impact the environment through other media. As a result, EPA is allowing—and inadvertently promoting—pollution control technologies that may merely shift the point of harm to human health and environment, without reducing that harm, all at great cost to industry.

EPA should instead base BAT standards on candidate technologies' total impact to human health and environment, regardless of the media of impact, and should specify limits to all media in the standards.

In addition, Congress should make it clear that EPA may use pollution prevention technologies candidates as BAT reference technologies, then EPA finds pollution prevention technologies available and appropriate for an entire industry segment. Under the Clean Air Act, EPA has been requiring states to adopt regulations based on pollution prevention technologies for years.

Several provisions in section 201 of S. 1114 address these issues.

Conclusion: Towards a Whole Facility Approach

Ultimately, we would hope to see the development of a "whole facility" approach to environmental protection. Such a whole facility approach would include:

- a one-stop multi-media permitting program which includes a facility planning requirement, provides companies with technical assistance upon request, provides companies and permit writers with the latest information on verified pollution prevention technologies ⁵ and financial assistance programs, and by streamlining and accelerating permit reviews and cutting fees makes the administrative burden of a permittee seeking to dramatically exceed the minimum BAT standard dramatically less than that of merely meeting the minimum.
- a reporting requirement which consolidates and rationalizes the many single-program reporting requirements faced by the company into one report, free of redundancy and nonsense, with assistance provided if needed, and with protection of legitimate trade secrets.
- a multi-media compliance inspection and enforcement program with a bias towards pollution prevention in enforcement actions.

EPA's Source Reduction Review Project takes an important step in the developing such an approach, as do the efforts of states such as New Jersey and Massachusetts (see Attachment C). Toxic pollution prevention language of the sort contemplated in S. 1114 would take us yet a quantum leap closer to a whole facility approach. EDF applauds the effort of the subcommittee to make the leap and looks forward to working with the subcommittee to further perfect that effort.

Attachment A

WHAT THEY ARE SAYING ABOUT POLLUTION PREVENTION

Here's what a Clinton-Gore Administration will do:

Support effort to mandate public reporting on toxic chemicals used and produced by companies, and *require those companies to develop plans for reducing their toxic chemical use.*

"Putting People First" (1992)

Governor Bill Clinton and Senator Al Gore (emphasis added)

Designing products and processes (or redesigning existing products and processes) with a system to identify health, safety and environmental impacts throughout the product life cycle is one of the most effective ways of managing the product risks . . . One objective of this Practice is attainment of the preferred environmental hierarchy: source reduction: reuse; recycling; and disposal. Source reduction includes equipment or technology modifications, process or procedure changes, product reformulation or design, substitution of raw materials, and improvements in housekeeping, maintenance, training or inventory control.

Product Stewardship Code of Management Practices
Chemical Manufacturers Association

Turning environmental concern into competitive advantage demands that we establish the right kind of regulations. They must stress pollution prevention, rather than merely abatement or cleanup. They must not constrain the technology used to achieve them.

Properly constructed regulatory standards, which aim at outcomes not methods, will encourage companies to re-engineer their technology. The result in many cases is a process that not only pollutes less but lowers cost or improves quality.

Michael Porter

Harvard Business School, 1991

EPA should emphasize pollution prevention as the preferred option for reducing risk. By encouraging actions that prevent pollution from being generated in the first place, EPA will help reduce the costs, intermedia transfers of pollution, and residual risks so often associated with end-of-pipe controls.

Preventing pollution at the source—through the redesign of production processes, the substitution of less toxic production materials, the screening of new chemicals and technologies before they are introduced into commerce, energy and water conservation, the development of less pollution transportation systems and farming practices, etc.—is usually a far cheaper, more effective way to reduce environmental risk, especially over the long term.

"Reducing Risk"

EPA's Science Advisory Board, 1990

Attachment B

THE EPA—AMOCO YORKTOWN REFINERY PROJECT

EPA and Amoco recently cooperated on a project to examine multi-media and pollution prevention issues at an Amoco oil refinery in Yorktown, Virginia. The two most important lessons of this often-discussed project are usually overlooked.

The first lesson regards an Amoco blind spot: It is remarkable how little the company knew, before the project, about the fate of all the valuable hydrocarbons entering and exiting their Yorktown refinery. The Yorktown refinery is a unit of one of the world's largest corporations, one with a large engineering staff. The moderately-seed refinery is 35 years old and uses a standard technology. Every hydrocarbon molecule released as pollution to the air or the Chesapeake Bay is a molecule that can not be sold by Amoco as a product. In other words, the Yorktown refinery is exactly the type of facility whose management one hopes would know the fate of every pound of potential product/pollutant.

In fact, before the project Amoco knew very little about the releases of product from the refinery to the environment. The monitoring Amoco performed as part of the project greatly advanced general understanding about pollution from refineries.

Amoco's lack of self-knowledge went beyond the question of how much product was being lost as pollution: Amoco was not structured to prevent that type of loss at the source. During the project, process and mechanical engineers from Amoco's Chicago headquarters met with the Yorktown refinery's operators to develop pollution

prevention strategies—i.e. changes to the refinery's production process that could reduce product loss (read "pollution") prior to any end-of-pipe recycling or pollution control. According to the Amoco employees in attendance, this meeting was the first of its kind at Amoco (and may even have been a first for the oil refinery business). In effect, Amoco had previously compartmentalized its design, operation, and environmental protection functions as severely as EPA had compartmentalized its air, water, and waste programs.

None of this necessarily calls into question Amoco business decisions. After a point, it no longer pays to track down every leak for the sake of selling the otherwise-leaked product. At some point the marginal cost of controlling leaks exceeds the marginal value of the product at the pump. Unfortunately for the environment, however, an amount of product too small to be worth saving for its own value may nevertheless have a big impact on the environment.

Which leads to the second lesson of this couplet, one which goes to a blind spot in our environmental protection system. If it is surprising how little Amoco knew about its loss of product to the environment, it is alarming that EPA regulation's did not lead Amoco to learn more. EPA's regulatory programs treat the Yorktown refinery as a bundle of smokestacks and drain pipes, each with a separable pollution problem, rather than as a whole connected facility. In taking this one-pipe-at-a-time view of the refinery, EPA perversely (and inadvertently) led Amoco away from tracking down and preventing product from becoming pollution.

The EPA-Amoco Yorktown project's true value was in illustrating what many observers are starting to realize: (1) industry does not always prevent pollution as much as it could, partly because (2) EPA's one-pipe-at-a-time programs can lead industry away from prevention.

Attachment C

THE MASSACHUSETTS BLACKSTONE PROJECT

In 1989, the Massachusetts Department of Environmental Protection (DEP) decided to do something about the confusing and sometimes conflicting signals sent by the separate air, water, and waste inspectors that could visit any given Massachusetts company.

Like EPA and nearly all state environmental agencies, DEP's air, water, and waste programs were separate and often not closely informed of each other's actions. This often had unfortunate consequences both for the environment and for the businesses regulated by these programs.

For example, a company could be required by DEP's water program to install a wastewater treatment system, learning only later of the expense and liability associated with the hazardous waste generated by the system. A company installing end-of-pipe control devices to capture waste solvent headed for the air or water might never learn of safe substitutes for the solvent which would obviate the need for the control devices.

DEP wanted to change this and, in particular, wanted to transmit the message that pollution was a problem regardless of media, and that the best way to approach the pollution problem was to prevent it. To do this, DEP came up with the Blackstone Project.

In the Blackstone Project's first pilot year, the project tested different methods of:

- coordinating air, water, hazardous waste, and right-to-know inspections;
- issuing enforcement actions that led violators to use toxics use reduction as the primary means of compliance; and
- coordinating regulatory activities with technical assistance.

At the project's core was an attempt to treat each business like a business, rather than a bundle of smokestacks, drain pipes, drums of waste.

The project was a success. Among other things:

- Blackstone inspectors were better able to detect hitherto unpermitted wastestreams and were able to perform inspections in less time than typically allotted for those inspections.
- Companies inspected by Blackstone inspectors were found more likely to seek out technical assistance and subsequently implement pollution prevention.
- Over 80% of the companies inspected said in a later survey that they preferred Blackstone inspections over standard single-media inspections—even though most of them were subject to enforcement actions resulting from the Blackstone inspections.

The approach taken by the project has flourished and is being expanded statewide.

ENDNOTES

1. This testimony follows EPA's lead in defining "pollution prevention" as essentially equal to "source reduction" as defined in the Pollution Prevention Act of 1990:

"source reduction" means any practice which—

(i) reduces the amount of any hazardous substance, pollutant, or contaminant entering any waste stream or otherwise released into the environment (including fugitive emissions) prior to recycling, treatment, or disposal; and

(ii) reduces the hazards to public health and the environment associated with the release of such substances, pollutants, or contaminants.

The term includes equipment or technology modifications, process or procedure modifications, reformulation or redesign of products, substitution of raw materials, and improvements in housekeeping, maintenance, training, or inventory control.

(Emphasis added. See EPA Memorandum on "EPA Definition of "Pollution Prevention", from F. Henry Habicht II, Deputy Administrator, May 28, 1992.)

2. "EPA Releases 1991 Toxics Release Inventory Data", *EPA Environmental News* (EPA news release), May 25, 1993.

3. Created by the Emergency Planning and Community Right-to-Know Act of 1986.

TESTIMONY OF BRUCE BAKER, DIRECTOR, WATER RESOURCES MANAGEMENT, WISCONSIN DEPARTMENT OF NATURAL RESOURCES

Mr. Chairman, members of the Subcommittee, my name is Bruce Baker. I am the Director of the Bureau of Water Resources Management of the Wisconsin Department of Natural Resources. I am here today representing the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA), as a member of the Board. As you know Mr. Chairman, ASIWPCA is the national professional organization of State officials responsible for implementing water quality and related programs in the States.

Let me take this opportunity to thank you, the members of the Subcommittee and your fine staff, for the continued access you have provided ASIWPCA and the States. We can identify many areas in S. 1114 where you have taken the States' concerns to heart. Our testimony today focuses on Water Quality Standards (WQS) policy, effluent guidelines, toxics, pollution prevention and NPDES permit and enforcement requirements. The ASIWPCA membership is in the process of reviewing S. 1114 and our Association will compile comments at our August Annual Conference. Once that review is complete, we will forward our more detailed comments to you Mr. Chairman.

The 1972 Clean Water Act set specific goals and requirements for enhancing our nation's waterways under which significant accomplishments have been achieved. It is time for us to collectively review our progress and examine outstanding issues that need to be addressed. The States' recommendations are premised on the following principles:

1. The Clean Water Act is fundamentally sound. Significant refinements should, however, be made to address program effectiveness including:
 - Increased funding for State management.
 - Continued Federal capitalization of the State Revolving Loan Fund (SRF).
 - Increased State flexibility to operate programs more efficiently and effectively, to maximize environmental results and undertake comprehensive approaches.
 - Elevated USEPA priority on the program's fundamentals—(eg: up-to-date effluent guidelines and WQS).
 - Enhanced nonpoint source management programs in the States.
2. States must continue to have the lead role in program development and management. Delegation of NPDES and SRF programs are cost effective, managerially efficient and institutionally appropriate.
3. Additional time is needed to carry out the 1987 Amendments. Lack of funding, inadequate technical resources and late issuance of policy and regulatory guidance have created unnecessary delays which must be accommodated in any reauthorization.
4. Any new mandates must be accompanied by increased funding above the current baseline.

RECOMMENDATIONS SUMMARY

It is our Association's view that:

- While S. 1114 recognizes the need to update and expand Water Quality Standards and effluent guidelines, significant changes in WQS policy are unnecessary and disruptive of program momentum.
- The permit and enforcement program is fundamentally sound, though woefully underfunded. S. 1114 attempts to address this funding issue, but it must be recognized that NPDES fees envisioned in S. 1114 are *only* adequate to bring the existing program up a base level of performance.
- Limiting and eliminating pollution should be a solution of choice, without being too prescriptive.
- Rather than focus on programs that function well, the Bill should address the nation's priority problems, particularly nonpoint source management. As with the 1987 Act, another round of standards and point source requirements *will preclude getting to that important agenda.*

ASIWPCA is very concerned that a myriad of new requirements in the Bill will greatly increase program complexity and administrative burdens, exacerbate the extensive backlog of expired permits and contested cases and have little positive impact on the quality of our environment.

WATER QUALITY STANDARDS

WQS have been the heart of State implementation of the national water quality laws for almost 30 years. Given the diversity of natural environments throughout the nation, *ASIWPCA's position has consistently been that States must have flexibility to develop WQS, tailored to meet individual hydrology, geology, topography, ecosystem and climate considerations.* A top down "cookie cutter" approach prevents such efforts, inhibits innovation and thwarts aggressive and/or creative approaches, which can result in national improvements. The State adoption process is a efficient method to expedite implementation with extensive outreach and education. WQS policy *should not* inhibit public involvement or limit the States' ability to accommodate advances in science.

States recognize the importance of maintaining a level of national consistency. The water program suffers from outdated Federal Section 304 criteria and lack of clear national policy on their application. This has caused unnecessary challenges in the development of individual control strategies and pollution prevention. States have had to resolve USEPA guidance issues, which has resulted in delayed promulgation, proliferation of litigation, delayed permits, and unwarranted inconsistencies across States.

However, the primary responsibility for establishing WQS must remain with State and Interstate Agencies. The burden of proof for disapproval should always rest with the USEPA. *Presumptive applicability, as described below, is unacceptable to the States*, because it recognizes neither the responsibilities and authorities of the States, nor actual water quality needs. Approval should remain a State process. USEPA and appropriate Interstate Agencies should be provided with a opportunity to review the standards to assure interstate compatibility and compliance with guidelines. USEPA needs to focus more on its vital role of providing States with technical information and coordinating Federal interests.

States applaud the Bill's effort to set USEPA on a better course by expediting and improving criteria development. USEPA needs to develop a strategic plan under which they are given wide latitude to identify priorities. And, States must be assured of a formal and prominent role in the preparation of this plan in conjunction with USEPA, because they are at the forefront of standards development and implementation.

- As the bill recognizes, USEPA should develop national mixing zone policy. However, the specific criteria on acute toxicity and minimum flows, included in the Bill, may create an unplementation problem, particularly with the terminology used.
- States support requiring all Federal Agency programs, projects and facilities to comply with State WQS. Such compliance is critical to achieving the goals of the Clean Water Act. ASIWPCA is pleased to see the proposal requiring applicants (in proceeding under FIFRA and TSCA) to provide complete data and information on the toxicity of compounds. We urge the Committee to *go several steps further*, specifically:

- 1) *Implementation*: All new or revised criteria need to include an implementation component on translating criteria into permit limits, to address basic issues on which there is commonality (i.e. criteria, alone, are not effective).
- 2) *Intermedia Impacts*: The Law needs to address further control of air deposition and specify applicability to CERCLA and RCRA actions, where it has been demonstrated that such sources violate WQS.
- 3) *Fish Advisories*: A nationally consistent approach to fish advisories is needed among the various Federal agencies. USEPA should provide guidance and technical assistance.

- We must share with you our concern that, in some areas, *the Bill goes too far* interfering with State decision making authority. Complex mandates are not justified when neither resources nor scientific evidence can support such requirements. If S. 1114 were implemented, as is, the standards process upon which the entire Act depends would be hopelessly mire down. This would severely curtail watershed planning and other comprehensive management efforts.

Presumptive Applicability: States oppose, in the strongest terms, S. 1114's presumptive applicability of Federal criteria. The balance between State/Federal roles and responsibilities must be maintained. *Section 304(a) criteria are not perfect and USEPA does not have the ability to second guess States*. In most instances States have better information, more innovative means of developing the data and more efficient and success ways to create standards that will meet the Act's goals and objectives. Presumptive applicability could result in the loss of these significant State contributions. And with State adoption, the nation gets firm commitment to monitoring and attainment of those criteria. Implementation would otherwise be delayed and the environment would suffer.

Biological Criteria: States should be able to adopt numerical chemical and/or numerical or narrative criteria for toxics, with flexibility to translate standards into specific numeric permit limitations. *S. 1114 is too prescriptive*—relying on only numeric criteria—which may or may not be protective of the ecosystem.

Uses: All waters should have designated uses, determined in the context of the express goals and objectives stated in Sections 101 and 303 of the Act. However, States oppose USEPA automatically applying a fishable/swimmable classification. Again, States should be in the leadership role, with USEPA held to the same justification requirements as States. In some areas, fishable/swimmable quality is impossible or unreasonable due to natural or other conditions.

Antidegradation Policy: The definition of outstanding national resource waters (ONRWs) and waters of ecological significance in S. 1114 can include such a large number of waters that it can weaken the significance of the designation. Some waters identified for designation, (eg. recreational areas, wildlife refuges and waters supporting threatened and endangered species), simply do not deserve the special level of protection envisioned. These types of waters should be evaluated to determine their suitability (on a site-specific basis) for inclusion as ONRWs, etc. Meeting established WQS in these waters will, in most instances, protect these uses without the special designation. Again, States need flexibility to implement successful, locally tailored programs.

EFFLUENT LIMITATIONS

The Association supports S. 1114's effort to update effluent guidelines Categorical effluent limitations a the regulatory cornerstone of the Act and primary tool for working toward elimination of pollution discharges, including pollution prevention, waste minimization and recycling. These guidelines serve as an equitable program baseline.

The majority of existing best available technology economically achievable (BATEA) guidelines are seriously outdated, thus of little value in the regulatory program. States are forced to rely on WQS to establish proper effluent limitations. This process is resource intensive, and most States are not in a position to develop the industry-by-industry data. Updated national guidelines can avoid the inefficiencies of ad hoc best professional judgment and associated inconsistencies, inequities and negative incentives. States believe that the objectives outlined below can be accomplished in a manner that is workable for all concerned.

States agree with S. 1114 that USEPA must publish and update effluent guidelines under Section 304(b) of the Act to:

- Establish aggressive deadlines for industrial categories not yet addressed.
- Better define BATEA to assure they, in fact, reflect the best currently available.
- Update the factors set forth in 304(b) for BATEA and specifically address pollution prevention and waste reduction measures.

In addition, USEPA should reclassify some nonpoint sources to be point sources (e.g., some urban runoff)—as well as the converse—to protect water resources more efficiently.

TOXICS

States need to place priority on and significantly expand their programs in the area of nonpoint sources. Though States have remaining concerns about toxics *USEPA needs broad flexibility* to focus on the most important toxic problems in the most effective and expeditious manner to minimize substances unacceptable in the environment. Dictating particular solutions will not, in our opinion, solve the problem. We suggest that:

- USEPA needs expanded Clean Water Act authority to revise requirements in other media programs in order to protect water quality (see also Pollution Prevention).
- A high priority for 304(l) listed pollutants or waters is not always justified. Other waterbodies and pollutants may well be the major impediment to water quality goals.
- Toxic reduction program requirements should be based on need.
- While prohibitions on discharges of certain toxics are justified, State and USEPA discretion must be provided to determine when and where such actions are appropriate.

POLLUTION PREVENTION

The States commend the Committee for S. 1114's emphasis on prevention of pollution, which can lessen the burden on the permitting and enforcement programs. We have learned that "end-of-pipe" regulation is not always the most effective or efficient way to address water quality problems. However, zero discharge literally means zero availability. Unfortunately persistent chemicals, once in the environment, are likely never to be zero. Some of the requirements in S. 1114 will place too great a burden on State resources. Specifically:

More flexibility is needed. The USEPA should be required to take *agency-wide action* to assure maximum progress toward the goals of pollution prevention and zero discharge:

- *Implementing prohibition sanctions authorized in the Toxics Substances Control Act* to prevent the production and use, in the market place of specific persistent, bioaccumulative toxic substances. Priority should be placed on substances exceeding State or Federal *action levels* in fish flesh. Bans should be an integral part of such a national strategy.
- *Listing toxic substances for which the discharge, emission, and release shall be minimized in all media programs* (air, water, waste management, etc.). States should be able to have regulatory programs that go beyond traditional technology or water quality based programs.

NPDES PERMITTING AND COMPLIANCE

S. 1114 addresses the major problem in the existing permit and compliance program—*lack of resources*—to implement existing requirements. States are concerned however about other aspects of the proposal because:

- *There is no demonstrated need for many of the Bill's NPDES provisions.* Some will undermine State delegation and create complex mandates for which there are neither resources nor environmental justification. The Bill would further slow the program, with endless controversy and litigation. *What States need is a streamlined program to achieve more environmental results, not a more complex burdensome process of paper shuffling.*
- *Permit fees will only provide enough resources to bring the existing program up to a basic level of performance.* Even then, proposed restrictions on permit fees may not allow States, which are now 100% funded by State fees, to accommodate needed growth.

Delegation:

- States strongly oppose S. 1114's extensive Federal intrusion into the State permit process, with "helter-skelter" overfilling and second guessing. The program will not work, unless States maintain their lead role. A well structured and predictable process is essential to the program's success. If States are not performing adequately, any problems should be addressed through the existing permit and delegation review procedure.
- States should not be sanctioned by USEPA issuance of backlogged permits—the problem is:
 - 1) A lack of resources.
 - 2) Incomplete, late or vague national policy.
 - 3) Inadequate USEPA science and public education.
 - 4) Contentious permittees.

If these are overcome, States can and would manage fully effective permit programs.

- In order to protect water quality, States should be allowed to regulate vessel discharges more restrictively than the Act requires. The vessel population in some States is increasing annually by 10% predominantly in waters classified for swimming and recreation. More attention is clearly necessary in this area.
- Field citation authority would be beneficial, but should be delegable only to States—not contractors. States should also be able to file suit, using USEPA's enforcement authority under Section 309.
- USEPA should use its administrative penalty powers under Section 309 only if a State has failed to take sufficient action. In such situations, States must be consulted and provided with an opportunity to respond and/or, if necessary, take additional action. S. 1114 circumvents the current process which was worked well for many years.
- States should not be required to have monetary penalties identical to USEPA's. States have a host of enforcement tools and mechanisms, in addition to penalties, to achieve compliance. The stipulated amount exceeds the levels imposed on USEPA and could be particularly onerous for small municipalities and small business.
- § 106 funds should not be sanctioned (up to 35%) if State agencies, despite good faith efforts, do not have a \$10,000/day administrative penalty or expanded judicial review. The monitoring, standards and watershed programs will suffer—along with MPDES, thus demeaning the entire State program. This seems contrary to the Senate's intent embodied in S. 1114. It would be more effective, for example to "deputize" States, giving them authority to apply USEPA penalties.

Requirements:

- Achievement of WQS should be the objective. Adding other requirements, (i.e. protection and propagation of a balanced population of shellfish, fish and wildlife), is unnecessary, confusing and extremely difficult to determine or measure.
- Section 403 criteria *should not be expanded*. The process is already complex and onerous. The existing law is adequate to protect the resource.
- Permits should not be required prior to construction.
- 10 year permit terms should be authorized (with re-opener clauses to deal with scientific or water quality changes). States should be able to put permits on a stable workload cycle.
- Changes in pretreatment requirements are not needed. The program is adequate and the current municipal workload is already overwhelming. The establishment of pretreatment standards equivalent to categorical limits may not achieve desired results, but will increase the already extensive State permit workloads.
- The expanded judicial reviews in S. 1114 will encourage delay and wasteful litigation.
- Use of civil penalties for beneficial projects and restoration of natural resources may be appropriate. However, State consultation should be required in determining suitable options.
- Requiring courts to consider previously imposed penalties will make it difficult for States to secure timely settlements with violators.
- There is no demonstrated need to further encourage citizen suits. They have been of limited value in addressing priority problems and for past violations would accomplished little. Often citizen suits duplicate rather than enhance State action. And, while such suits can be of utility, they should be used to take initiative when government is unable to do so.

- We question whether USEPA emergency powers need to be expanded to instances when there "may be" an imminent threat. This is an extremely broad and vague standard. State consultation should be required to minimize inconsistency and promote appropriate action.

ANTIBACKSLIDING

The existing law is confusing on application of anti backsliding policy in the NPDES process. Permittees are reluctant to accept effluent limits if the requirements make it impossible to relax limits in the future—even for justifiable reasons. This has resulted in endless conflict with the State regulators that significantly delays permit issuance. The policy has impeded State adoption and implementation of new WQS and discouraged dischargers from performing better than permits require. Limits that became unnecessary over time, still require monitoring and compliance. This is so, even though the resources could be put to better use in permit oversight. S. 1114 should allow the removal or modification of effluent limits in cases where:

- The limit is determined to be *unnecessary* because of errors in calculation,
- *New scientifically valid information* is published, or
- A determination is made that *the substance is not present* in the discharge.

In no instance should removal of a limit allow a permittee to reduce the level of existing treatment technology.

SUMMARY

Mr. Chairman, the Association appreciates your leaderships, and that of Senators' Baucus and Chafee, in providing a legislative vehicle for national debate on Clean Water. As you proceed to refine the Bill, ASIWPCA and the States look forward to working closely with you and your staffs. I am delighted to answer and questions and thank you again for inviting me to join you today to discuss Clean Water.

STATEMENT OF ANITA DAWSON, MANAGER, ENVIRONMENTAL AFFAIRS, AMERICAN CYANAMID COMPANY

Good morning. My name is Anita Dawson. I am Manager of Environmental Affairs for the American Cyanamid Company. I am appearing today on behalf of American Cyanamid and the Chemical Manufacturers Association (CMA) to discuss our views on pollution prevention in the context of the toxics controls proposed in S. 1114, the Water Pollution Prevention and Control Act of 1993.

CMA is a nonprofit trade association whose member companies represent more than 90 percent of the productive capacity of basic industrial chemicals in the United States. The chemical industry provides 1.1 million high technology, high wage jobs for American workers and consistently maintains positive trade balances. CMA's members are directly and significantly affected by the requirements of the Clean Water Act.

Mr. Chairman, the Clean Water Act is a pollution prevention statute. Its existing controls on industrial point source discharges have proved very successful. Dramatic improvements to water quality have resulted and will continue to occur under existing law as dischargers comply with increasingly more stringent technology-based and water quality based limits. These controls are challenging companies to look beyond end-of-pipe treatment towards other pollution prevention practices such as source reduction and recycling. The results of all these efforts are nothing less than remarkable. EPA data reveal that less than 10 percent of the remaining water quality problems of the nation can be attributed to industrial discharges. Reductions in discharges of toxic pollutants are particularly encouraging. According to information supplied to EPA's Toxic Release Inventory, Clean Water Act standards adopted in 1987 have helped reduce chemical industry discharges to America's waters by 77 percent in just five years.

This committee is considering a bill, however, which does not reflect these positive trends. Instead, it imposes overly intrusive, extreme and unnecessary requirements on industrial point source discharges. These requirements would not promote pollution prevention; they would discourage it. In particular, the effluent guidelines and toxic discharge prohibitions sections of this bill would have this negative effect. I'd like to discuss these provisions today and will elaborate on a number of other concerns we have with S. 1114 in our more detailed written statement.

This bill requires EPA to establish effluent limitation guidelines on the basis of changes in production processes, products and raw materials. We believe this is an

inefficient, inflexible and improper approach to pollution prevention. It wholly disregards the complex nature of manufacturing and product development. There are literally thousands of manufacturing processes in use in American industry today. The chemical industry alone uses hundreds of unique operations. End-of-pipe standards that *require* raw material substitution or process modifications cannot adequately reflect these variables. At a minimum, they would inhibit industry's ongoing development of innovative and cost effective pollution prevention technologies and techniques. More harmful is the threat that these standards pose to the competitiveness of U.S. manufacturing industries. These standards would result in the discontinued use of effective manufacturing processes, in the phase-out of many beneficial products, and in the significant impairment of the quality of other products. The inappropriateness of EPA requiring changes in production processes, products and raw materials cannot be overstated. The effect would be minimal environmental protection, at a huge cost and competitive disadvantage to industry generally, as well as a loss of jobs throughout the economy.

Mr. Chairman, industry already analyzes its processes, raw materials and products to determine how best to prevent pollution in order to meet effluent limits. It invests much time and money to do so. Incentives to further *encourage* industry to perform these analyses would be a better approach to pollution prevention than the heavy handed, command and control approach described in this bill. Pollution prevention is not a "one size fits all" proposition. Flexibility is key. Every company practicing pollution prevention today knows this.

For example, my own company has developed a pollution prevention project that involves changing a process from a batch oxidation reaction process into a continuous process step. This change is reducing wastewater pollutant loading by 50% and volume by 25%. It's also increasing product yield and product quality. It has not been a simple project, however. It's taken more than 6 months of laboratory development, small-scale testing and finally full-scale testing to develop. This testing included verifying the reaction would work, lab stress experiments, testing the impacts on each processing step, analyzing the products and by-products of each step, refining analytical procedures for new conditions, evaluating scale-up effects and finally full-scale trials. The project has involved a research chemist, an analytical chemist, lab personnel, a process chemist and a process engineer. Many ideas were tested that did not work.

The point I'm trying to make is that any manufacturing process, product or raw material changes—whether to effect pollution prevention, product yield or product quality—are extremely complex decisions that do not lend themselves to inflexible regulatory *compliance* schemes such as best available technology standards under the Clean Water Act. These types of changes are extraordinarily site specific. Pollution prevention decisions are constrained by technological feasibility, economics, and product quality. Even simple changes in the suppliers of raw materials requires detailed evaluations of the material's effects through all the process steps. Process and product changes also raise the question of the interrelationship with other product control laws. Many of my company's products are FIFRA registered products. If a process modification changes minor components of the final products, we must modify its FIFRA registration—a process that takes one to two years—before we can make the change. This would raise compliance problems under the Clean Water Act.

From a resource perspective, development of end-of-pipe standards on an industry-by-industry basis that could even moderately reflect—much less *require*—"best available" production processes, products and raw materials within industries would be prohibitively resource intensive given the enormous complexities. The type of major R & D effort that EPA would have to apply to accomplish this task would be far beyond what EPA has undertaken in past guideline development efforts. An example is the recently promulgated effluent guidelines for the organic chemicals, plastics and synthetic fibers point source category. EPA declared that the "detailed study and technical development effort on a product/process-by product/process basis" to determine the feasibility of wastewater recycle was "far beyond the scope of what EPA can practicably accomplish." (Final Rule amending 40 CFR 414, signed May 28, 1993, pre-publication draft, p. 28) This comment merely referenced EPA's review of wastewater recycle within the chemical industry. The detailed review of industries processes, products and raw materials that would be required by this bill would be even more impractical.

If effluent guidelines were mandated in accordance with the provision in this bill, the result would be standards that reflected overly broad generalizations about industries. Requiring industries to conform to these generalizations about their processes, products and raw materials would be mandating industry how to manufac-

ture. Attempting to achieve pollution prevention through these type of rigid national standards is an inappropriate approach that would discourage more pollution prevention than it would encourage, stifle innovation, and harm the competitive posture of U.S. manufacturing industries.

The toxic discharge prohibition section of this bill poses a different, although related, set of concerns. It would require EPA to apply the most drastic control measures available under the Clean Water Act discharge bans—simply on the basis of EPA identification of a substance as highly toxic or toxic and highly bioaccumulative. Merely because a pollutant is toxic and bioaccumulative does not mean that its discharge in any amount poses a threat to human health and the environment. Further, the bill does not require that such identification be peer-reviewed by a qualified panel of scientists. There's also no required demonstration of any adverse effects/risks posed by substances identified as bioaccumulative. Finally, there's no review of any economic considerations of such actions. Like the effluent guideline provision, this discharge prohibition takes an overly simplistic approach to pollution prevention. It, too, would place U.S. manufacturers at a disadvantage compared to their foreign competitors.

In short, this provision inappropriately assumes that the only effective way to control these pollutants is to ban their discharge. To justify such an extreme response, EPA, at a minimum, must demonstrate a clear relationship between an identified chemical and an unreasonable risk to human health or the environment. Rather than discharge bans, Congress should apply the full range of risk management options to any newly identified pollutants, considering their adverse effects and exposures.

In conclusion, Mr. Chairman, the changes proposed in this bill are not suggested by the progress achieved to date as a result of the Clean Water Act's controls on industrial discharges of toxics. The two provisions I've discussed today are not appropriate responses to any remaining threats posed to water quality from industrial point source discharges. These provisions are drastic responses to emotionally charged but unsubstantiated claims about industry's contribution to water quality impairment. We urge this committee to re-think its approach to better take into account the significant progress industry has already made and will continue to make under the existing provisions of the Act.

TESTIMONY OF MARTHA G. PROTHRO, ACTING ASSISTANT ADMINISTRATOR, OFFICE OF WATER, ENVIRONMENTAL PROTECTION AGENCY

INTRODUCTION

Good morning, Mr. Chairman and Members of the Subcommittee, I am Martha Prothro, Acting Assistant Administrator of EPA's Office of Water. Accompanying me today is Bill Diamond, Director, Standards and Applied Science Division, in the Office of Water. As Administrator Carol Browner has discussed with you, we believe the Clean Water Act (CWA) is fundamentally sound, but requires some adjustments so that EPA along with our Federal, State, Tribal, local, and private partners can develop innovative solutions for the water quality problems that remain.

Reauthorization gives us an opportunity to solidify our control of toxic pollutant discharges, to help improve the scope and timeliness of water quality standards, and to focus our water program on the highest priority risks to health and the integrity of our aquatic ecosystems. This will enhance our ability to meet the goal of restoring and maintaining the chemical, physical, and biological integrity of our Nation's water.

Under existing statutory authority we have achieved considerable success in substantially reducing the discharge of toxics to our Nation's waters. The Clean Water Act has already enabled us to control millions of pounds of toxicants through technology-based controls. We have established ambient water quality criteria for most toxic pollutants of concerns and we are refining and expanding those criteria as new risks are identified. To make further progress, our primary challenge is to implement these criteria through standards, permitting, and enforcement programs, and to address contaminated fish and sediments that have been polluted by past discharges.

The Act already provides a broad range of tools to EPA and the States, as well as the flexibility to adapt them to different circumstances. We can improve some of these tools, but we should avoid the temptation to add new requirements and deadlines merely because some toxic hot spot areas still remain in our waters. We can address most problems with existing authorities. Before adding new mandates, we should consider whether current law in fact will suffice, whether the remedy pro-

posed appropriately addresses the problem at hand, and whether we are responding proportionately to the range of stresses that impair water quality. Priorities and resources need to be assigned to all remaining risks, including nutrients, pathogens, habitat loss and other problems as well as toxics.

TECHNOLOGY-BASED APPROACH

The CWA provides technology-based and water quality-based approaches for controlling the discharge of pollutants from point sources into surface waters. If the technology-based controls are not sufficient to protect the desired uses of the waterbody, then water quality standards provide the basis for further controls.

Under the technology-based program of the Act, EPA requires municipal sewage treatment plants to achieve secondary treatment at a minimum and requires industries to meet effluent limitation guidelines, new source performance standards, and categorical pretreatment standards. Effluent limitation guidelines and standards are based generally on the best technology available that is economically achievable. In developing effluent limitation guidelines and standards, EPA currently considers source reduction and recycle and reuse technologies—not just end-of-pipe controls—as the basis for effluent limitations. We also consider the potential transfer of pollutants to other media in setting discharge limits. We have promulgated 51 technology-based effluent guidelines covering over 100 different industries. We will promulgate another 20 new or revised guidelines over the next 10 years. These guidelines set numeric limits as appropriate not only for the 126 priority pollutants under section 307(a), but also for any appropriate conventional and nonconventional pollutant for which analytic methods are available. (Currently, more than 300 such pollutants can be regulated.) The technologies that industries typically employ to meet effluent guidelines generally remove many more pollutants than are specifically regulated.

One of the reasons that the effluent guideline program has been successful is that we base our decisions on simple formula: available technologies (including source reduction and process changes) that are economically achievable by industry. Several provisions of S. 1114, however, will help to improve the technology-based guidelines program and stimulate a pollution prevention ethic in industrial dischargers.

Streamlining Technology Standard Developments for Effluent Guidelines

Current law requires that EPA apply several different thresholds to direct dischargers in setting guidelines. Limits are then set based on best practicable technology, best conventional technology, or best available technology, depending on the type of pollutant. The separate analyses are complex and difficult to administer and can cause significant delays in the guidelines development process, and may not result in better (or different) control requirements. The Administration supports the goal of S. 1114 of moving toward a more streamlined set of standards, but has not yet established a position on appropriate thresholds.

Special consideration should also be given to conventional and other pollutants that biodegrade in publicly owned treatment works (POTWs) after discharge by industry. In other words, industry would not be required to treat pollutants that the receiving POTW adequately treats, although EPA would regulate pollutants discharged to sewers when the POTW cannot provide treatment. Current law also addresses this issue by establishing a complex system of pass through and interference analyses, along with removal credits for individual dischargers. This approach has its limitations for a variety of reason, including technical difficulties, litigation problems, and resource limitations.

PRETREATMENT

In the last decade, the National Pretreatment Program has evolved into a mature environmental program with local governments effectively regulating most industrial and commercial discharges to POTWs. Over 1,500 POTWs have approved local pretreatment programs designed to protect against the adverse effects of industrial and commercial discharges to municipal sewer systems. These local governments regulate over 30,000 "significant industrial users" of their sewer systems by establishing "individual control mechanisms." POTWs also conduct routine inspection, monitor, and take enforcement actions, as appropriate. They control an even greater number of smaller industrial and commercial users, through less formal means, where this control is warranted. For example, small commercial sources, such as photofinishers and service stations on an individual basis may not pose a concern; in the aggregate, however, they may discharge significant quantities of pollutants that interfere with the municipality's treatment processes, volatilize into the air or into the sewer system, persist in wastewater treatment sludges, or go untreated into re-

ceiving waters. Municipalities are improving their understanding and their controls of all of these sources.

The pretreatment program is a multi-media environmental program designed to address water quality, land disposal and air emissions problems, as well as the safety of sewer workers. A POTW with an approved pretreatment program evaluate whether local controls is needed, in order to: (1) protect the sewer system and wastewater treatment plant capability, (2) protect water quality and enable the POTW to comply with its National Pollutant Discharge Elimination System (NPDES) permit limits, (3) ensure sewage sludge of sufficient quality to comply with EPA's national sewage sludge regulations, and (4) protect the health and safety of POTW workers. Industrial pretreatment controls may also provide a vehicle for reducing air emissions of volatile organic pollutants that would otherwise be released from sewers of POTWs. Many cities have demonstrated impressive improvements in effluent and sludge quality as a result of effective local pretreatment programs.

Based on our experience in implementing and overseeing this program, we support the following changes: EPA should have authority to issue individual control mechanisms to significant industrial users when there is no approved local or State program, and removal credits should be restructured and reconsidered. We also believe that the domestic sewage exclusion under the Resource Conservation and Recovery Act (RCRA) should be retained.

EPA regulations require POTWs with approved local pretreatment programs to issue "individual control mechanisms" to all significant industrial users. These individual control mechanisms are functionally equivalent to the NPDES permits issued by EPA and States for direct dischargers. They contain applicable effluent standards, monitoring requirements, reporting requirements, and other appropriate controls. In most cases, a State or locality runs the pretreatment program locally. However, in some circumstances, EPA must act as the "control authority" because there is no approved local pretreatment program or approved State pretreatment program. EPA, however, has no direct authority to issue an individual control mechanism to an indirect discharger. We believe that EPA and approved States should have the authority to issue appropriate individual control mechanisms to significant industrial users when they are not subject to an approved local pretreatment program.

The removal credits provision was intended to allow an industrial user to increase the amount of a pollutant that is discharged to a POTW above the level that would otherwise be allowed by a national categorical pretreatment standard, provided the POTW can demonstrate that its treatment works consistently removes those pollutants and does not exceed water quality or sludge limits in its permit. Historically, as few as thirty POTWs have expressed an interest in obtaining or actually have received approval for the authority to issue removal credits. Resource constraints, equity concerns and a desire to provide a margin of safety for the POTW have all been cited as reasons for low interest. Another concern with removal credits is that a POTW may be able to demonstrate that a pollutant is not being identified in tests of its effluent. In such instances, the pollutant may not actually be removed but is simply transferred to the sludge or the air, where it contributes to a violation of standards. Alternatively, the pollutant may be undetectable in the effluent using current analytical techniques, and nevertheless cause significant risks.

Even if the law is changed so that categorical pretreatment standards set industry limits for all but those pollutants that are biodegradable in the POTW, there still is a need for removal credit authority, because categorical pretreatment standards might still regulate some pollutants that are not consistently biodegradable at the typical POTW but may be fully biodegradable at site-specific POTWs. For such pollutants, removal credits would be appropriate but only for those toxic pollutants shown to be removed through biodegradation in the POTW. Therefore, we generally support S. 1114's position on removal credits as the best environmental, technical, and programmatic approach.

The third issue is the appropriateness of retaining the domestic sewage exclusion or limiting its applicability. The domestic sewage exclusion [specified in section 1004(27) of RCRA] provides that a hazardous waste, when dissolved in domestic sewage (e.g. sewage from residences), is not a hazardous waste under RCRA. The rationale for the domestic sewage exclusion is that RCRA management of wastes within a POTW is unnecessary and redundant because these wastes are regulated under the Clean Water Act, specifically by the pretreatment program. In the mid-1980's, EPA conducted a study on the discharge of hazardous wastes to POTWs and submitted a report of the study to Congress in February 1986. The report concluded that the domestic sewage exclusion should be retained and improvements should be made in pretreatment regulatory controls rather than creating a new RCRA pro-

gram for these wastes. In July 1990, EPA promulgated changes to the General Pretreatment Regulations to strengthen controls on nondomestic discharges, with particular emphasis on wastes that may be covered by the domestic sewage exclusion. States and cities have implemented those changes and we now have a stronger pretreatment program. As a result, we believe that existing pretreatment authorities are the best vehicle for controlling such wastes and that the domestic sewage exclusion should therefore be retained.

We also believe it is unwise to condition the applicability of the domestic sewage exclusion on EPA's development of technology-based, categorical pretreatment standards or on the equivalency of local limits with RCRA Best Demonstrated Available Technology standards. One reason is that such an exemption is expected to result in tremendous pressure on EPA and municipalities to issue new regulations under the CWA merely for the purpose of providing exemptions from RCRA. We believe it is critical to maintain environmental protection and risk reduction as the criteria for selecting industries for regulation. Additional controls that are appropriate and necessary can be provided under existing authorities.

POLLUTION PREVENTION

As S. 1114 recognizes, existing effluent guidelines provisions in the CWA should be clarified to promote pollution prevention practices. Historically, the Agency has set numeric effluent limitations, compliance with which is measured at the end-of-pipe. While this has the considerable benefit of allowing dischargers great flexibility in deciding how to meet the requirements, it does not necessarily foster source reduction practices. EPA's experience in over twenty years of effluent guidelines development is that facilities typically use end-of-pipe treatment to comply with the limitations, rather than reduce their source of pollutants or wastewater flows. The Office of Water has verified this in its recent surveys of the pharmaceutical and metal products and machinery industries. Allowing EPA to address intermediate wastewater discharge points should help encourage recycling, reuse and source reduction.

End-of-pipe limits also allow co-mingling of wastewater, which in some cases means that pollutants are present at levels that can cause significant harm but are diluted to levels below detection. While the courts have upheld EPA's authority to set in-plant limits, we believe this authority should be clarified to avoid costly litigation and controversy. We agree that clarifying language would be helpful in allowing the Agency to consider intermediate discharge points. EPA would like to work with the Committee to craft language that will address the dilution issue for case where end-of-pipe concentrations are below detection limits while preserving a facility's flexibility to devise innovative solutions and avoiding requiring EPA to regulate processes.

We also support allowing EPA to address transfers of pollutants to other media. Although EPA currently considers cross-media effects in deciding whether and how to regulate, the CWA does not now allow EPA to preclude use of compliance technologies that simply transfer pollutants from surface water to other media. For example, some chemical plants use air stripping to treat volatile organics in wastewater, as opposed to steam stripping that allows recovery of solvents and prevents direct emissions to the atmosphere. When developing effluent guidelines, EPA should be authorized to prohibit or limit the use of certain technologies where other economically achievable compliance methods are available that would not result in transferring pollutants to other media, taking into account relative costs and environmental benefits.

Current law explicitly authorizes EPA to specify Best Management Practices (BMPs) in effluent guidelines to "control plant site runoff, spillage or leaks, sludge or waste disposal, and drainage from raw material storage . . ." for toxic or hazardous pollutants (section 304(e)). Some industries can generate significant amounts of waste due to spills and leaks that contain conventional or nonconventional pollutants, but these events are not explicitly addressed in section 304(e). Our authority for specifying BMPs needs to be explicitly broadened to cover all pollutants and all sources of pollutants. This will help promote a more comprehensive pollution prevention approach.

WATER QUALITY-BASED APPROACH

To complement these technology-based approaches, the CWA also gives States the primary responsibility to develop water quality standards for waters within their jurisdiction, including rivers, lakes, estuaries, near coastal waters and wetlands. Water quality standards provide the regulatory basis for pollution control and provide a measure for evaluating water quality improvement programs.

Water quality standards consist of State-designated waterbody uses, criteria to protect the designated uses, and an antidegradation policy to ensure that existing uses, high quality waters and Outstanding National Resource Waters are maintained and protected. Through the designation of uses for waterbodies within a State, water quality standards define the goals for the waterbody in terms that we all can understand—fishing, swimming, protection of aquatic life and so on. Water quality standards should not and do not focus only on the control of chemical-specific discharges, but also provide us a way to consider factors affecting the physical and biological integrity of the waterbody as well.

WATER QUALITY CRITERIA DEVELOPMENT

Section 304(a) of the Act gives the Administrator broad authority to develop the sound science and issue criteria, guidance and methods to assist States in the adoption and implementation of their water quality standards. In the 1970's and early 1980's, EPA focussed water quality criteria development efforts on a relatively narrow subset of all water quality problems. Efforts emphasized chemical-specific numeric criteria to protect aquatic life or human health because pollutants were associated with problems perceived as the highest priority at the time, notably problems associated with discharges from point sources. Reflecting these priorities, the statute targeted point source discharges and EPA set its scientific priorities accordingly. We continue to work on addressing some remaining individual chemical pollutants that still cause significant water quality problems, but we also need to shift our attention to give priority to other types of very serious water quality problems. We need a comprehensive set of criteria, methodologies and guidance to accurately assess the health of aquatic ecosystems and support efforts to maintain and restore the physical and biological, as well as chemical integrity of our waterbodies.

Although the Clean Water Act now provides EPA adequate authority to develop a range of chemical, physical and biological water quality criteria, there is no statutory provision for setting priorities based on maximum risk reduction potential, programmatic effectiveness, and other appropriate factors. Both the science and our understanding of environmental problems is rapidly changing, and it is apparent that the opportunities to make scientific progress through the criteria development process are staggering. The needs clearly exceed the level of resources we can reasonably anticipate in the near term. EPA would therefore advise against narrowly focussed statutory requirements that would drive the criteria development process without regard to environmental priorities. For example, we have broad authority and have already developed a powerful arsenal to address chemical-specific pollutants, especially toxics, through the criteria program. These criteria are being adopted into standards and permit limits and will achieve significant water quality improvement. While implementation of the toxics criteria is an ongoing priority in the NPDES permit program, scientific priority must go to the relatively unexplored areas of biological and sediment criteria.

For these reasons, we support S. 1114's provision to authorize the Agency to prepare a comprehensive priority-setting criteria development plan that balances risk and programmatic effectiveness. Our State, Tribal, local, Federal and public partners should participate in establishing these priorities. In this way, we will undertake to ensure that resources will not be diverted away from tomorrow's challenges. This provision should be the engine that drives our criteria program.

CONTAMINATED FISH CONSUMPTION ADVISORIES

Environmental equity considerations require that we address the high risk that contaminated fish may pose to sensitive subpopulations, including pregnant women, native and ethnic subsistence fishers, and those with compromised immune systems. States are responsible for regulating contaminated fish that are not traded in interstate commerce and do so through the issuance of fish advisories. Nationwide, approximately 1200 State fish consumption advisories are in effect, but there is inconsistency in the way they were developed, the level of information contained in them, and the way susceptible populations are informed of the risks. This leads to public confusion about whether recreational or subsistence fishing is a safe way to supplement an individual's diet. The Clean Water Act should authorize EPA to provide factors to be considered in the development and issuance fish advisories.

SEDIMENT CONTAMINATION

Closely related to fish contamination is the environmental risk posed by contaminated sediment. The best information we have indicates that hundreds of sites nationwide have sediment contamination at levels harmful to aquatic life and human health. In accordance with the 1992 Water Resources Development Act, EPA is pre-

paring a national inventory of contaminated sites. In addition, EPA, in coordination with other Federal agencies, the scientific community and the public, has initiated a broad range of activities to address this priority problem. Because there are no simple solutions to the control and remediation of sediment contamination, we need continuing flexibility to address the highest risk reduction priorities in this area in a cost-effective manner. We are learning more all the time about this critical problem but the main difficulties we face in this area do not seem amenable to a legislative solution. We hope to continue working with the Subcommittee in this regard.

STATE WATER QUALITY STANDARDS REVIEWS

Section 303(c)(1) of the CWA requires that from time to time, but at least once every three years, States should hold public hearings to review their water quality standards and, if appropriate, to modify and adopt new standards. This helps ensure that (1) waterbody use designations and goals reflect current conditions, (2) criteria are based on the best current science and address emerging issues, and (3) anti-degradation and other implementation policies, methods and practices are revised or modified to fully meet the goals of the Act.

EPA must review and approve or disapprove State water quality standards and any changes. The Administrator must promulgate standards for a State if a State fails to make appropriate revisions to meet the requirements of the Act.

In practice, States are not reviewing and updating their water quality standards every three years, but frequently take many years longer than the statute now requires. States have many other mandates and problems to address, of course. However, these lengthy delays sometimes amount to serious bottlenecks in developing programs to restore and maintain our Nation's waters. For example, delays in State adoption of water quality standards for toxic pollutants inhibited the effective identification of impaired waterbodies and the establishment of control requirements in NPDES permits under the 1987 amendments. Even though EPA had published most of the aquatic life and human health criteria for toxic pollutants in 1980 and the 1987 CWA amendments required States to adopt numeric criteria for toxics, only 6 of 57 States and territories had complied by February 1990—the end of the triennial review cycle following the 1987 amendments. Most States did not begin to adopt toxic pollutant standards until after 1990 when the Agency initiated Federal promulgation actions. EPA ultimately had to establish standards for 14 States through Federal rulemaking, a process that took two years and eight months to complete. States were given primacy in water quality standards adoption under the CWA largely because it was believed that local conditions and State preferences should be taken into account. EPA continues to support this philosophy, but we note that even with this lengthy adoption process following the 1987 amendments, most standards adopted by States were identical to EPA's national water quality criteria guidance.

At the same time, Federal promulgation is not a perfect antidote to these delays. States deserve to be given deference in adopting water quality standards when they do act in a timely way. Federal promulgations are resource intensive and time consuming for EPA. Moreover, while promulgation of numeric criteria for toxics was important, we also cannot ignore the fact that both EPA and the States had to make difficult resource allocation choices in order to comply with the various mandates of the 1987 amendments.

In order to address these historical problems, we agree with the authors of S. 1114 that the provisions for timely review, update and adoption of State water quality standards should be strengthened and streamlined. We need to maintain the opportunity for State exercise of primacy and substantive flexibility, but we also need to ensure that standards are established in a timely fashion.

Another issue is how to assure that, as water quality programs move toward a watershed focus, the review and revision of waterbody use designations and implementation policies in State standards are coordinated with watershed programs. The current triennial review cycle inhibit those efforts. Triennial reviews may also be incompatible with the increasing complexity and site-specific nature of newer forms of water quality criteria, such as nutrient, salinity, habitat, biological and toxicity criteria. Not only are the new forms of criteria more difficult and time-consuming to adopt than chemical-specific criteria have been, but their application may also need to be different. For example, it may be appropriate to use biological criteria, at least initially, primarily as an assessment and evaluation tool rather than as the basis of a permit limit. Harmonizing the time frames of various complementary water programs (e.g., standards, permits, nonpoint source, estuaries, etc.) would facilitate integration, implementation and evaluation of water pollution control programs. We support adjusting the timeframes to advance the progress of comprehensive watershed protection approaches.

For chemical-specific pollutants, EPA believes that States should adopt numeric water quality criteria based on EPA criteria guidance within a fixed time, perhaps three years, after EPA publishes such guidance. If a State fails to adopt numeric water quality criteria for these pollutants, EPA's criteria should become the applicable water quality standards for all purposes of the Act. For other types of criteria (e.g., nutrient and biological), the Clean Water Act should require State adoption, within four years of the publication of EPA's section 304(a) criteria guidance. (These criteria may require more site-specific consideration by States.) The Senate bill generally helps to move us in this direction. In addition, in place of the triennial review, every five years, States should be required to conduct a comprehensive review of all uses, criteria and policies in their water quality standards, including updating use attainability analyses for all waters that are not designated as "fishable or swimmable" and reaffirming, if appropriate, that these uses are not unattainable. Such an approach recognizes the changing nature and increased complexity of the water quality program. It also retains State flexibility to address water quality standards within a realistic, but timely schedule.

Finally, States should be required to implement antidegradation reviews that specifically protect high quality waters and specifically designate Outstanding National Resource Waters within the State's boundary, although State primacy in designing these waters should be preserved.

TOXIC PROHIBITIONS

Through the Clean Water Act's technology-based and water quality-based permits approach, there has been significant progress in decreasing the discharge of harmful toxic pollutants to surface waters. These will continue to be our main tools to control toxic pollutants. However, the discharge of certain highly toxic and bioaccumulative pollutants can create serious environmental and human health problems.

Some pollutants are extremely harmful quantities or may build up in the food chain to produce adverse, long-term effects on human health and the living ecological resources. Some pollutants can be linked not only to cancer, but also to neurological disorders, and reproductive, developmental and immunological impacts. Such pollutants can damage aquatic ecosystems directly by eliminating populations of sensitive species or indirectly by causing increased incidence of disease in the remaining species. Some pollutants may persist in the environment for decades, posing a continuing threat to humans, aquatic organisms, birds and other wildlife.

Section 307(a)(2) now authorizes EPA to issue an "effluent standard" (which may include a prohibition) establishing requirements for toxic pollutants. However, the statute provides an unusually burdensome rulemaking process for setting these standards, a process that is far more costly and difficult than the Administrative Procedure Act requirements that govern most of the Federal government's rulemaking. Not surprisingly, this cumbersome process has rarely been used. It was used most recently in 1977 when EPA published effluent standards for aldrin/dieldrin, DDT, DDD and DDE, endrin, toxaphene, benzidine and polychlorinated biphenyls.

We support a change to the CWA to improve EPA's ability to restrict or prohibit the discharge of the most highly toxic and bioaccumulative pollutants, where appropriate. The Senate bill recognizes the need for this change. Some pollutants are so harmful to the environment or human health that the best approach is to further restrict or prohibit their discharge entirely. If EPA's Administrator makes this discretionary determination, there should be a fair but reasonably expeditious procedure available to assure timely implementation.

We believe that it is important to preserve the Administrator's discretion in determining whether to restrict or ban the very worst toxic pollutants. The Administrator should be able to consider many different factors including: (1) the pollutant's persistence, toxicity, and bioaccumulation potential; (2) the magnitude and extent of exposure to the pollutant; (3) the relative contribution of point source discharges to the overall risk; (4) the availability of and risk posed by substitute chemicals or processes; (5) the beneficial and adverse social and economic effects of any effluent standard, including the impact on energy resources; (6) the extent to which effective control is being or may be achieved in an expeditious manner under other regulatory authorities; and (7) other factors that Administrator deems appropriate.

CONCLUSION

Reauthorization comes at a critical stage in the evolution of the water program. We need to improve our programs and move them forward without destroying the basic structure that allows the CWA work well. Improvements are needed in technology-based effluent guidelines to cover conventional, nonconventional and toxic pollutants, as well as to integrate the pollution prevention ethic. The pretreatment

program needs some adjustments, but only where we can strengthen the ability of local communities to carry on their control efforts. The scope and timeliness of State water quality standards can be improved as we move beyond the chemical-specific focus on toxic pollutant controls and on toward protecting the biological and physical integrity of our waters. Detailed, prescriptive requirements could hamper the Nation's efforts to address the highest priority risks to watershed and human health protection, and inhibit our ability to rely on the collective experience of our State, Tribal, local, Federal and public partners in devising creative solutions to those risks.

We look forward to continuing to work with the Committee as we jointly tackle these difficult and important challenges.

WRITTEN STATEMENT OF JOHN STEIN, THE NATIONAL ENVIRONMENTAL DEVELOPMENT ASSOCIATION

INTRODUCTION AND SUMMARY

The National Environmental Development Association's Clean Water Project is pleased to offer its views to the Subcommittee on Clean Water, Fisheries and Wildlife on issues in the reauthorization of the Clean Water Act. The National Environmental Development Association is a diverse coalition of companies united in the belief that it is possible to have both economic growth and a clean environment. It is in that spirit that we present our suggestions for improving the Clean Water Act to make it more effective and less costly.

The NEDA Clean Water Project believes that the Clean Water Act has induced remarkable progress in improving the nation's water quality over the last two decades. The major remaining sources of water pollutants are non-point sources and the last unregulated industrial discharges that do not have federally established categorical standards. Both of these are very site specific and neither is very amenable to controls through the broad-based technology standards that form the foundation of the current law.

The NEDA/Water Project agrees with the conclusion that many others have come to—that a watershed management approach is the most effective way to address the remaining pollutant loadings to water. Such an area wide approach also makes the application of free market approaches to pollution control more feasible.

In reauthorizing the Clean Water Act, Congress should take care to make the Act more flexible, not more restrictive. Unfortunately, S. 1114 grants unparalleled power to the Environmental Protection Agency to regulate all phases of product manufacturing, distribution, use and disposal under the guise of protecting the nation's water resources.

The NEDA Clean Water Project believes that such an approach is mistaken, and would be doomed to failure if attempted. Such centralized decision making has produced both lower living standards and lower levels of environmental protection where it has been tried in Eastern Europe and the former Soviet Union.

On the other hand, individual initiative undertaken by knowledgeable experts at each facility, or in management for a particular watershed area, can produce water quality improvements at the least cost to society. An institutional framework incorporating flexibility and market based incentives is needed to allow such initiative to be undertaken and rewarded. The use of tradable effluent rights within a watershed is an approach that offers the chance to achieve the nations clean water goals at the least cost to society.

Likewise, Congress should not prohibit the use or release of substances without carefully considering the consequences of its actions. The decision should consider the economic impact of such an action, and the technical feasibility of achieving "zero discharge", along with the environmental effects of such imposing such restrictions.

In addition, Congress should not modify existing relationships between companies and publicly owned treatment works (POTWs) without carefully considering the consequences of its action. The present system is working well, and local authorities should retain the authority to determine the proper restrictions on discharges to POTWs. Mechanisms are already in place to ensure that such discharges do not harm either the POTWs or the environment.

The NEDA Clean Water Project also believes that where the federal government imposes mandates upon state and local governments, it should also provide financial support to carry out those mandates. Congress should continue or expand the state revolving funds or reinstate grant programs and fund them at a level sufficient to ensure that state and local governments can carry out the programs.

In enforcement areas, the NEDA Clean Water Project believes that citizens should not be given the right to sue companies for violations that occurred entirely in the past. Such actions are punitive—they do not improve present compliance or deter future violations—and should be the prerogative of governments. The government should preserve its authority over such actions to ensure that all societal goals are considered in deciding to pursue any punitive action.

Finally, in reauthorizing the Clean Water Act, the Congress should ensure that requirements are both economically and technically achievable.

MARKET BASED APPROACHES

Market based approaches to environmental protection offer a way to improve the quality of the nation's water resources while ensuring that the goal is reached in the most cost effective manner. In particular, provisions for the trading of effluents in individual watersheds should be explicitly added to the Clean Water Act. Trading makes it possible for those who can most easily reduce loadings to bear the cost of doing so, thereby achieving water quality goals at the least cost to society. Moreover, a market approach offers the opportunity to move more quickly and innovatively to achieve the nation's water quality goals.

A watershed management system offers an ideal environment in which to conduct trading. Trades should be restricted to a single watershed to ensure that the trading system can be defined and controlled, and that the results can be measured. In this fashion, we can ensure that the program provides real benefits, and does not create additional environmental problems.

Trading should be allowable between point sources, between non-point sources, and also between point sources and non-point sources. Trades among similar types of loadings, trading oil and grease for oil and grease for instance, or trades involving similar types of health or environmental concerns, e.g., trading chemical oxygen demand for biological oxygen demand or carcinogens for carcinogens, do not pose any conceptual problems. Exchanging effluents in these circumstances should be permitted as a matter of routine.

Trading in toxics is controversial, but should be allowed for the same reason that trading in other loadings is allowed—it provides a mechanism for water quality goals to be met at the least cost. Exchanges could be based on relative toxicity, no observed effect concentrations (NOECs) for instance, and volumes. Trading in all loadings should only be limited if it is necessary to prevent "hot spots" which might exceed water quality standards.

Trading in dissimilar substances, e.g., between suspended solids, oil and grease, toxics, etc., presents some difficulties. No valid scientific foundation exists for making comparisons among these substances, or for deciding that watershed loading from one is more or less harmful than loading from another. Even so, the concept should not be dismissed out of hand. Situations may arise where the net benefit is obvious. For instance, it may be beneficial for a watershed to trade a very large reduction in oil and grease for a relatively small increase in toxics. We suggest that the concept be left open for future exploration.

In a tradable permit system, companies should be able to use trading to meet BAT requirements. In addition, indirect dischargers connected to the same publicly owned treatment works should be able to trade their effluents, in coordination with the POTW, to achieve a least cost solution without adding loadings to the POTW. Language should be inserted into the act to encourage POTWs to accept such exchanges rather than relying solely on categorical standards, again with routine variances granted so that POTWs do not have to enforce these standards. In all situations, the anti-backsliding provisions of the Clean Water Act would have to be clarified to ensure that facilities buying the ability to discharge more effluents do not face a legal impediment which calls the entire process into question.

Operating this type of a trading system requires both a clearinghouse for exchanges of effluent permits, and an accurate characterization and model of loadings for each watershed. The characterization and model are necessary to identify loadings and their sources so that anticipated changes as a result of trades will reflect reality. A trading model must account for the potential for modifying loadings from various point and non-point sources. EPA, the U.S. Geological Survey, the Corps of Engineers and other government agencies should be required in the reauthorized Clean Water Act to develop these watershed models and databases in conjunction with the cities, farms and industries that will be affected by them.

A clearinghouse for trades would be responsible for making a market in effluents. While commodities markets will perform this function for sulfur dioxide under the clean air act, this approach does not seem feasible under a watershed management

system. The modeling exercise necessary to ensure accuracy in equivalent loadings seems beyond the scope of commodities exchanges at this point.

Instead, the experience in trading air emissions in southern California could serve as a useful model for trading in a watershed. Like a watershed, southern California is a discrete area with unique characteristics for air. Firms in the airshed were assigned an emission baseline, and could then buy permits from others to exceed that baseline or sell permits to others by doing better than its baseline. Trades are cleared through a government control agency which ensures that over-all air quality goals are met. This concept could be expanded to include a futures market so that companies deciding to improve their pollution control and sell their permits can be sure that the market will reward their investment. Such a clearinghouse should be established as part of the Act.

Importantly, a watershed trading system should be set up to minimize constraints on exchanges. Excessive cost, paperwork, delays or other transaction costs detract from the value of trading. Ultimately, such transaction costs could make trading unattractive, as they have in some areas, and the country would be denied the benefit of using an economically efficient method of achieving environmental goals. A reauthorization bill should make it clear that the object of a trading system is to minimize the cost of achieving environmental goals, and should place the burden of proof on the controlling agency that its requirements are essential. Notification to EPA or state authorities, with adequate time for review, should be sufficient to allow a trade, provided that the agencies raise no objection to it.

TOXIC USE REDUCTION

EPA is currently required to establish effluent guidelines for industry that reflects the best available technology. Where the best available technology is not sufficient to protect water quality, water quality-based limitations are imposed on dischargers.

S. 1114 adds an additional factor to the determination of BAT: toxic use reduction. The proposal places EPA in the position of making decisions regarding production processes in the guise of protecting water quality. Production decisions should be made by experts—private business—not by the government. Production processes and raw materials are the heart of business decision making, and opportunities for manufacturing flexibility and innovative environmental solutions must be encouraged, not restricted.

The government should not dictate business decisions ranging from the extraction and use of raw materials to the design of finished products. Such authority has great implications for the growth and international competitiveness of the United States economy, and should not be granted. Full consideration of the possible effects of such great government control over product decisions will reveal the danger of this action.

Current law provides sufficient authority to establish best available technology standards, and more stringent water quality standards. These should be continued along with market based approaches to provide the maximum opportunity for innovation and manufacturing flexibility to achieve water quality goals.

TOXIC POLLUTION CONTROL

Limitations on releases in the current law are balanced between the desire for a pristine environment and other goals of society.

Banning the discharge of specific chemicals, as has been proposed, does not consider the tradeoff between the value of a substance to the country and the impact of possibly removing it from use. While it may sometimes be technically feasible to eliminate the discharge of a substance, it may be prohibitively expensive to do so.

Thus, the economy may be deprived of an important ingredient, or that ingredient may become much more expensive, for little or no environmental improvement.

In deciding the allowable level of substances in a facility's effluent, the EPA should balance the impact of limiting the discharge with the technical feasibility of control and the environmental effects of the effluent.

Congress should not ban the discharge of any substance without balancing the environmental risks to be lessened against the benefits of that substance for both producers and consumers and the costs involved in removing it from the environment. The law should ensure that the nation will gain from requirements that are imposed.

PRETREATMENT

Substantial controls have been placed on indirect dischargers to prevent upsets to municipal treatment plants, or the pass through of untreated pollutants into receiv-

ing waters. This effective control system consists of federal pretreatment, effluent guidelines, and general pretreatment regulations, state indirect discharge programs, and local pretreatment programs and ordinances. The system is working well, and the disruption of municipal treatment plants by industrial discharges is almost nonexistent.

Municipal treatment works are often designed to accept local industrial effluent, and funded by charges placed on local industry. Such arrangements lower the cost of achieving water quality goals, and provide a strong customer base for the POTW. Where specific industrial effluents would interfere with a POTW's operation, pretreatment agreements mandate that the discharging facility treat those effluents to prevent environmental damage.

Prohibiting or restricting industrial effluents from being treated in POTWs would result in a squandering of existing investment in treatment works. It would force companies to build treatment facilities that duplicate the capacity of an existing facility, which could no longer be used. New treatment capacity would not be built as economically as the existing system. Companies would no longer be able to use existing capacity. Instead, they would be required to build a larger number of smaller facilities, with a corresponding loss of economic efficiency. Companies required to build treatment works would likely become direct dischargers regulated by NPDES permits rather than pay POTWs for duplicate treatment costs, which would also increase the government's expense for program management.

The POTWs would also lose. They were built and financed on the expectation that their industrial customer base would provide the revenue to repay their cost. With that customer base significantly reduced, many POTWs may find themselves in great financial difficulty.

The existing system of treating industrial wastes at POTWs is working well, and there is no need for a radical change.

Congress should not restrict the right of a discharger and a POTW to agree on a mutually beneficial way to achieve standards. Local authorities should retain the authority to determine the proper restrictions on discharges to POTWs. Mechanisms are already in place to ensure that such discharges do not harm either the POTWs or the environment.

FEDERAL FINANCIAL SUPPORT

The federal government should provide financial support at the state and local level for programs that it mandates. Congress originally established a construction grants program to help fund wastewater treatment plants required by the Clean Water Act. This program was later replaced by a state revolving fund program.

At that time, Congress authorized \$18 billion for the SRF, but has appropriated significantly less. The shortfall will amount to about \$2 billion by 1994.

In the meantime, new mandates have been increasing the cost of water programs. New water quality standards and treatment requirements combined with development pressures and economic growth have increased costs well beyond those foreseen during the last reauthorization of the Clean Water Act.

In addition, pollution prevention programs, stormwater and non-point sources controls, upgrades of many small treatment plants to meet more stringent standards, and additional legislative mandates have sent costs skyrocketing.

According to the Association of State and Interstate Water Pollution Control Administrators, over \$137 billion will be necessary through the year 2010 to meet the nation's need for water quality infrastructure. The Clean Water Council estimates that needs could amount to as much as \$167 billion through the year 2000.

Clearly, states and local communities do not have the resources to meet such expenditures. Attempting to place such costs on local governments will virtually guarantee that the nation's water quality goals will not be met.

The federal government should continue the SRF or reinstate grant programs and fund them at a level sufficient to ensure that state and local governments can carry out the mandates imposed by government.

ENFORCEMENT

Citizens should not be given the right to sue for violations that occurred in the past. Such authority would eliminate the distinction between citizen and government action to punish past transgressions. Eliminating that distinction carries a danger in that individual citizens are not bound by the government's need to pursue many public policy objectives. Citizens may ignore their effect on other societal objectives in the single-minded pursuit of one goal, and without the government's constraint of public accountability.

Such actions are entirely punitive—they do not improve present compliance or deter future violations—and are the prerogative of governments. The government should preserve its authority over such actions to ensure that all societal goals are considered in deciding to pursue any punitive action.

Moreover, natural resource damages should not be made a part of CWA enforcement. Environmental remediation is already a part of other laws. CWA enforcement should contain penalties appropriate to the degree of any violation and should be sufficient to be a deterrent to future violations. The separation between improvement projects and fines should continue to be maintained.

PERMIT REQUIREMENTS

In developing standards for best available technologies, EPA now considers a number of factors including the cost of control and the effectiveness of the control in improving water quality. In mandating a fishable and swimmable designation "where attainable", Congress has recognized the practical difficulties of reaching that goal.

In legislating water quality goals, Congress should consider the technical and economic feasibility of achieving those goals.

TESTIMONY OF CAROLYN HARTMANN, STAFF ATTORNEY, U.S. PUBLIC INTEREST RESEARCH GROUP

INTRODUCTION

Chairman Graham and members of the Senate Subcommittee on Clean Water, Fisheries, and Wildlife of the Senate Committee on Environment and Public Works, my name is Carolyn Hartmann and I am a staff attorney with the U.S. Public Interest Research Group. PIRGs are nonpartisan, nonprofit environmental and consumer advocacy organizations with over 1 million members nationwide. U.S. PIRG is the national lobbying office for PIRGs in over 30 states. PIRGs have been fighting to clean up our nation's waterways for over 20 years.

I would like to thank you for the opportunity to testify today on pollution prevention opportunities in the Clean Water Act and to provide specific comments on the pollution prevention strategies contained in the "Clean Water Pollution Prevention and Control Act of 1993" (S. 1114), introduced by Senators Max Baucus and John Chafee.

My testimony focuses in on four key sections of S. 1114:

- Sec. 201. Point Source and Technology Based Controls;
- Sec. 203. Toxic Pollutant Phase-Out;
- Sec. 205. Pollution Prevention Planning; and
- Sec. 601. Technology Development.

In addition, U.S. PIRG has reviewed the testimony presented by Jessica Landman on behalf of the Natural Resources Defense Council and Manik Roy on behalf of the Environmental Defense Fund and generally supports the positions taken and recommendations made by their organizations.

POINT SOURCE AND TECHNOLOGY BASED CONTROLS

Current point source and technology based controls in the Clean Water Act continue to focus on single-media solutions to the toxics problem. This single-media focus allows and even encourages industries to shift toxics from waterways to other environmental media such as air or land.

COMMENTS ON THE CLEAN WATER POLLUTION AND PREVENTION AND CONTROL ACT OF 1993—SECTION 201. POINT SOURCE AND TECHNOLOGY BASED CONTROLS

We strongly support provisions contained in section 201 of S. 1114 that revise sections 304, 306, and 307 of the Clean Water Act to make clear that standards shall take into consideration pollution prevention options and change the focus of standards to prevent media shifting. These amendments are an essential step for ensuring that reduced toxic discharges are not creating new environmental problems.

TOXIC POLLUTANT PHASE-OUT

THE PROBLEM

The Clean Water Act is based on the assumption that our waterways can absorb a certain amount of toxic materials. For certain toxic substances that persist and/or bioaccumulate in the environment, this assumption simply does not hold true. These substances are extremely resistant to natural degradation processes. They have the

potential to cause great harm, including birth defects, learning and behavior disorders, reproductive failures, immune system failures, and cancer, in very small quantities. They are not prone to traditional end-of-pipe regulation.

These substances in our waterways increase health risks to humans and other animals that eat contaminated fish and shellfish.

FINDINGS OF THE INTERNATIONAL JOINT COMMISSION ON GREAT LAKES WATER QUALITY

The International Joint Commissions' Sixth Biennial Report on Great Lakes Water Quality concludes that "persistent toxic substances are too dangerous to the biosphere and to humans to permit their release in any quantity." The Commission recognizes the following:

It can never be said that we can totally halt the input of persistent toxic substances into the system, or totally eliminate them. But humans can control what they do, so we can say that there should be—and shall be—zero discharge, or input, of persistent toxic substances as a result of human activities. Seen in this light, the Commission believes that virtual elimination is the necessary and reasonable goal, and zero discharge, or nil human input, is the necessary and not unreasonable tactic for achievement of the virtual elimination strategy.

Finally, the International Joint Commissions describes "zero discharge" in the following manner:

Zero discharge means just that: halting all inputs from all human sources and pathways to prevent any opportunity for persistent toxic substances to enter the environment as a result of human activity . . . Thus, zero discharge does not mean less than detectable. It also does not mean the use of controls based on best available technology, best management practices, or similar means of treatment that continue to allow the release of some residual chemicals.

THE EFFECTS OF TOXIC PERSISTENT AND/OR BIOACCUMULATIVE CHEMICALS ON THE ENDOCRINE, IMMUNE AND NERVOUS SYSTEMS.

Several months ago, Dr. Theo Colburn testified before the Senate Environment and Public Works Committee on the effects of synthetic chemicals on the endocrine, immune and nervous systems of wildlife and humans.¹ Dr. Colburn's testimony talked about conclusions reached by twenty-one experts who focused on the problems of maternal transfer of toxic chemicals to offspring. These experts reached some startling conclusions. These scientists stated with certainty that:

"A large number of man-made chemicals that have been released into the environment . . . have the potential to disrupt the endocrine systems of animals, including humans.

They proceeded to estimate with confidence that:

"Some of the developmental impairments reported in humans today are seen in adult offspring of parents exposed to synthetic hormone disrupters released in the environment."

And "unless the environmental load of synthetic hormone disrupters is abated and controlled, large scale dysfunction at the population level is possible."

Many of the substances Dr. Colburn's colleagues have studied are toxic and persist and/or bioaccumulate in the environment.²

COMMENTS ON THE CLEAN WATER POLLUTION AND PREVENTION AND CONTROL ACT OF 1993—SECTION 203. TOXIC POLLUTANT PHASE-OUT

Although we are pleased that Section 203 of S. 1114 recognizes that there are certain toxic substances that need special attention, we are very concerned that this section will not achieve necessary reductions in the use of toxic substances that persist and/or bioaccumulate in the environment. In addition, because this section fails to take a multi-media approach to the problem, and only focuses on discharges to waterways, it may even create new environmental problems.

Section 203 limits the Administrator's authority to take action "prohibiting the discharge of any toxic pollutant listed pursuant to paragraph (4)." By limiting the Administrator's authority to prohibiting "discharges" only, S. 1114 allows facilities to shift their toxics from the waterways to other environmental media. This is entirely contrary to the goals of pollution prevention.

Section 203 only allows the Administrator to list those pollutants that the Administrator determines to be "highly toxic or toxic and highly bioaccumulative; and occur in surface water predominately as a result of discharges." Some major sources of highly toxic pollution are non-point sources, including polluted runoff from agri-

culture. Other sources of pollution do not discharge to waterways but cause severe water problems nonetheless, such as mercury emissions from power plants or incinerators. Over half of the states have issued fish consumption advisories due to mercury contamination.³

In addition to focusing on toxic substances that bioaccumulate, S. 1114 should target persistent toxic substances for phase-outs. Persistent toxics are those substances that are poisonous in infinitesimally small quantities and remain in the environment for long periods of time. The current National Pollutant Discharge Elimination System (NPDES) assumes that our waterways' can absorb a certain amount of the toxic substances being discharged. Because persistent toxic substances do not easily breakdown in the environment, this assumption does not hold true.

We strongly support the requirement that the Administrator submit to Congress a report on the developmental effects of pollutants found in our waterways. This report should build upon the work already compiled by Dr. Theo Colburn and his colleagues, and will be critical to our understanding of the effects of persistent toxics and the steps necessary to protect future generations.

Recommendations for Phase-out

We urge the Committee to take an approach to toxic substances that persist and/or bioaccumulate in the environment which goes beyond focusing solely on discharges. We urge the Committee to set up a multi-step process which will identify highly toxic persistent and/or bioaccumulative substances that result in pollution of our waterways and establish a program designed to phase-out or "sunset" either the production or use of these substances over time and replace them with safer substitutes. We recommend that this process examine changes in production processes and products that eliminate toxic pollution to waters and other environmental media from these substances and their byproducts.

This goal might best be achieved if approached in three steps.

1. Phase Out the Use of Chlorine in the Pulp and Paper Industry.

Modern pulp and production technology creates some of the most toxic effluent that any industry can produce. Even with recent technology advances and reductions in the dioxins discharged to waterways, these persistent toxics continue to be discharged. As discussed above, because these toxics persist in the environment, we recommend a strategy which shifts the focus toward eliminating the use of chlorine compounds which cause the formation of persistent toxic byproducts rather than continual efforts to control these byproducts at the end of the pipe.

Safer alternatives to chlorine use in the pulp and paper industry do exist and mills in this country and abroad have begun to make the switch to these safer alternatives.

In the late 1980's, European papermakers were coming on-line with alternatives, chlorine-free technologies for producing high-quality paper without polluting their already overloaded ecosystems. They were spurred by aggressive regulatory systems in their countries. In the United States, papermakers were denying that a problem existed. In 1992, the International Joint Commission recommended that chlorine use be eliminated not only from the pulp and paper industry but from Great Lakes industries altogether.

Canadian regulators have begun to respond to the message as well. The provinces of British Columbia and Ontario (the two largest paper producing regions in North America) have now adopted rules to end the use of chlorine by the paper industry by 2002.

In the United States, Louisiana-Pacific's Samoa, California mill is already producing 250 tons of "totally chlorine free" (TCF) paper per day and will have converted the other 750 tons per day by 1995. Louisiana-Pacific has joined the environmental community in urging the EPA to call for procurement of chlorine-free paper by the federal government.

Other facilities making commitments to move to TCF paper production include Lyons Falls in Lyons Falls, New York; Georgia-Pacific in Bellingham, Washington; Mohawk Paper in Mohawk, New York and Cross Point in Miami, Ohio. Unfortunately, some of the companies, including Georgia-Pacific continue to use chlorine at other mills around the country.

There are benefits to weaning this industry from chlorine use that go beyond the environmental benefits. As long as a pulp mill uses chlorine, it has to dump its process water, because attempts at recycling would cause corrosion of mill equipment. Chlorine Free mills that are closing the loop on their processes are reducing their water use by approximately 80 percent. If the pulp and paper industry had been

chlorine free by 1991 the chlorine industry would have saved over 94 billion gallons of water in 1991 alone.⁴

If pulp mills close the loop, they can recover and reuse a majority of their processing materials. Industry analysts estimate that chlorine-free closed loop mills can produce paper products for 30 percent less than their chlorinated counterparts.⁵

The production of chlorine is an energy-intensive industrial process. By eliminating the demand for huge amounts of chlorine by the paper industry, we will save energy. If U.S. pulp and paper industries had shifted to non-chlorine alternatives, we would have saved an estimated 4.2 billion kilowatt hours of energy in 1992 alone.⁶

Whether or not one agrees that the use of chlorine in the paper industry is bad for the environment, the plain fact is that the world market is demanding totally chlorine free paper. The U.S. and Canada will always be the major paper producing countries, but each year control of the intellectual property of papermaking—designs, patents, royalties—worth millions of dollars, and the key to competition in the next century are being lost to European companies.

We urge the Committee to adopt the approach taken by Rep. Bill Richardson in legislation last Congress (H.R. 4949). Rep. Richardson will reintroduce legislation calling for a chlorine-free paper industry.

2. Expand the Phase-Out Process to a List of "Sunset Candidates."

The Clean Water Act should set forth a list of substances which presumptively qualify as "sunset candidates."⁷ Substantial work has been done in the Great Lakes and in other countries focusing on a relatively short list of substances that are toxic and persistent and/or bioaccumulative. We would like to work with the Committee and its staff to develop a list of substances that are appropriate initial sunset candidates. Attached as Appendix I are various lists targeted for sunset and a list of substances we recommend be used to begin the process.

We recommend that EPA set up a two stage process for dealing with these substances.

First, a "Sunset Chemical Board" should be established by the Environmental Protection Agency to determine which, if any, of the sunset candidates ought to be removed from the list by reason of inadequate scientific justification to warrant sunset. The Board would be empowered to recommend that specific uses, rather than all uses or production, be prohibited for a given substance.

We recommend that the Board be composed of multidisciplinary representatives from the EPA, National Institute for Occupational Safety and Health, National Institute of Environmental Health Sciences, U.S. Fish and Wildlife Service, National Marine Fisheries Service and International Joint Commission who are experts in toxicology, epidemiology, endocrinology, immunology, reproductive physiology, wildlife biology and other fields, as well as citizen organizations with relevant expertise. The Board should consider the substances' toxicity, potential to bioaccumulate, persistence or half life, and the amount of the chemical produced and released.

Congress must set forth a timetable to prevent endless delay. We recommend that the maximum timetable for the sunset of a candidate be eight years after enactment, with a proviso that the Administrator may extend the deadline by one year if a proponent demonstrates that the use (as well as discharge) of a sunset candidate can be eliminated if this additional time is allowed. A provision that addresses essential uses, for example medical uses, is needed as well.

Second, the Clean Water Act should direct the Administrator to establish a second committee or group of committees to recommend timetables and methods for phase-outs of chemicals on the finalized sunset candidate list, and to confer with the EPA on potential safe substitutes and alternative manufacturing processes available to facilitate phase-outs.

These committees should be made up of stakeholders, including individuals who use the sunset candidates and produce their potential safer alternatives and/or safer alternative production processes, and members of interested federal and state agencies, labor, and the environmental community. These committees would provide the EPA Administrator with final recommendations for phase-out timetables for the final sunset candidate list.

3. Establish a Longer Term Process for Identifying Classes of Chemicals for Phase Out.

In the instances where Congress has taken action to mandate reductions in the use of certain substances, it has often been too little, too late, as in the case of DDT and PCBs. Even though uses of these substances have largely been eliminated, we continue to live with their effects.

Attempting to approach the problem of long-term toxic contamination one chemical at a time can provide us with models for making safer production processes and products, but it will not solve our most severe toxic problems in the long-run.

The "one-chemical-at-a-time approach" generally fails to address the problems of unintentional byproducts of certain production processes. For example, dioxins are the byproduct of numerous different production processes. The "list approach" also generally fails to address the safety of alternatives. This approach often leaves companies searching for an alternative chemical to drop into place as a substitute for the listed chemical. The best alternative is often a change in the production process that eliminates the need for that step in the process.

We must begin to address entire classes of chemicals where that class exhibits similar troubling characteristics. The assumption has been that chemicals are "innocent until proven guilty." The burden has been on the public and government to prove that each individual substance causes significant harm rather than on the manufacturer to prove that it does not. This is not the approach we take with drugs and this should not be the approach we take for chemicals. Drug manufacturers are required to prove that the drugs they manufacture are safe and effective before they are placed on the market.

We must begin to apply the same tests to chemicals and reverse the burden of proof. This is especially true for certain classes of chemicals of concern.

The International Joint Commission has recently begun to focus their attention on organochlorines as a class of chemicals of concern. Organochlorines are defined as those compounds in which chlorine is bound to carbon-based organic substances. Organochlorines are produced intentionally as thousands of chemical products such as pesticides, plastics and industrial solvents. They are also produced as thousands of unintentional byproducts of industrial processes that use chlorine or other organochlorines such as in pulp bleaching, waste incineration or chemical manufacturing.

Based on the recommendations of the International Joint Commission's Science Advisory Board and their own deliberations, the International Joint Commission recommended in their Sixth Biennial report that "it is prudent, sensible, and necessary to treat [organochlorines] as a class rather than as a series of isolated individual chemicals." Because chlorine is the common precursor in the diverse set of industrial processes that produce this class of substances, the International Joint Commission concluded that "the use of chlorine and its compounds should be avoided in the manufacturing process." Specifically, the Commission recommended the following:

"... that the Parties, in consultation with industry and other affected industries, develop timetables to sunset the use of chlorine and chlorine-containing compounds as industrial feedstocks and that the means of reducing or eliminating other uses be examined."

Other classes of concern include organohalogens, and heavy metals.

We urge the Committee and the Congress to adopt the recommendations made by the International Joint Commission in their Sixth Biennial Report on Great Lakes Water Quality and apply those recommendations to the nation as a whole. I have supplied a copy of this report to the Subcommittee which I request be included in the record of this hearing.

Like the International Joint Commission, we recognize that the recommendation that Congress begin to develop timetables to sunset classes of substances, including organochlorines, is not a simple task. It will involve many industrial processes and some non-industrial ones as well. It may take many years, but the size of the task must not paralyze us.

The reauthorization of the Clean Water Act provides an opportunity to take several key steps toward tackling this problem. In addition to acting on the use of chlorine in the pulp and paper industry and some other key "sunset candidates," we recommend that the Committee direct the EPA and other appropriate agencies to complete a report to Congress with the following items of information:

All of the manufacturers of organochlorines that persist in the environment, the quantities of each of these substances produced annually, and the location of the facilities that produce these substances.

All of the industry sectors using organochlorines that persist in the environment, the purpose of this use, the quantities used annually and the location of the facilities using these substances.

All of the production processes that produce persistent toxic byproducts, including but not limited to dioxins, and the estimated quantities of these byproducts produced by each industry sector.

All currently and potentially available alternatives, including a review of safer alternatives, alternative processes, products or raw materials.

A recommendation for the phase-out in the production and/or use of specific organochlorines.

Legislation soon to be introduced by Rep. Bill Richardson will direct the EPA to complete a similar report to Congress. We urge the Committee to follow Rep. Richardson's lead and include a similar provision in their amendments to the Clean Water Act.

POLLUTION PREVENTION PLANNING

THE PROBLEM:

OTA Findings—

In 1985, Congress' Office of Technology Assessment (OTA) estimated that industry could cut waste production in half in only 5 years by implementing source reduction and toxics use reduction modifications to their production processes.⁸ OTA has also estimated that industry could save \$50 for every \$1 spent by government on source reduction.

Despite these findings, little has been done at the national level to encourage companies to achieve these pollution prevention goals.

The Inform Reports—

In 1985, the nonprofit research organization, INFORM, released a study of chemical plants entitled *Cutting Chemical Wastes*.⁹ This report documented that all of the plants that had looked for ways to reduce waste through source reduction found such opportunities and realized considerable cost savings after relatively short payback periods.

Unfortunately, the majority of companies are not prepared to undertake toxics use reduction or source reduction because their environmental programs focus exclusively on complying with pollution control requirements rather than on preventing pollution.

According to the INFORM study, the most important factors limiting source reduction were not technological. Nor were they economic or the result of regulatory impediments. Instead, INFORM found that what most often inhibited source reduction were a variety of institutional factors such as:

- inertia/fear of change,
- a belief that the existing process and operations were already maximally efficient,
- lack of knowledge of the sources of wastes within the plant
- lack of a system to account the full dollar costs of ongoing waste generation going back to its source,
- the lack of a system of rewards or incentives that involve plant employees in finding source reduction opportunities, and
- no one at the plant was responsible for overseeing their implementation.

Last year, INFORM released an update to *Cutting Chemical Wastes*. This second report, entitled *Environmental Dividends: Cutting More Chemical Wastes*,¹⁰ found the following:

- One-quarter of the source reduction projects required no capital investment and just under half required investments of \$100,000 or less.
- Nearly two-thirds of the projects were completed in 6 months or less including research and development.
- Over 60 percent of the projects had payback periods of six months or less.

Despite these promising findings, INFORM also found that the prevailing corporate focus continues to be on traditional end-of-pipe controls for toxic pollution.

POLLUTION PREVENTION ACT DATA

The latest data from the U.S. Environmental Protection Agency's Toxics Release Inventory supports findings in the INFORM report that pollution prevention still has not found its way inside the gates of the majority of U.S. companies. The EPA data shows that although emissions of toxic chemicals are generally declining, the same downward trend may not apply to hazardous waste generation.

This year, for the first time, under the Pollution Prevention Act of 1990, manufacturing companies were required to project for 1992 and 1993 their estimated waste generation. This data suggests that waste generation will not decline and may even increase in the near future. The EPA referred to this as a "disturbing trend." This data indicates that although some companies may be reducing their toxic discharges

to water, many of them are merely shifting those toxics to other environmental media, or treating or recycling wastes, rather than preventing the pollution.

STATE POLLUTION PREVENTION ACTIONS

In 1989 the nation's first pollution prevention laws were signed in three states, Massachusetts, Oregon, and Illinois. In 1990, Indiana, Washington and Maine passed toxics use reduction oriented laws. In 1991, New Jersey became the seventh state to pass a toxics use reduction law. To date over two dozen states have passed some type of pollution prevention law.

The pollution prevention laws in Massachusetts, Oregon and New Jersey were the result of intensive negotiations between industry, government and environmentalists. *All parties endorsed these laws upon passage.*

When the Massachusetts Toxics Use Reduction law passed in 1989, the president of Associated Industries of Massachusetts, John Gould, said, "There's economic pragmatism here." These state programs serve as a basis upon which to build a national pollution prevention planning program.

COMMENTS ON THE CLEAN WATER POLLUTION AND PREVENTION AND CONTROL ACT OF 1993: SEC. 205. Pollution Prevention Planning.

We support many of the concepts contained in the Pollution Prevention Planning provisions of S. 1114. This section of the bill clearly emphasizes the need to encourage and help companies search for pollution prevention strategies as the preferred approach to addressing toxic water pollution. We strongly support the concept that a person must complete a pollution prevention plan as a condition of obtaining a permit under section 402 of the Clean Water Act. If companies are to be allowed to discharge toxics into our waters, it is entirely reasonable to require them to take steps to ensure that they have searched for ways to prevent those toxic discharges.

We are concerned, however, that the planning requirements, as currently written, will not provide companies with the guidance necessary to effectively evaluate the majority of pollution prevention options available and may needlessly tie up EPA resources.

S. 1114 provides little guidance to companies to help them develop meaningful pollution prevention plans and goals. The purpose of the planning process should be to help companies find ways to prevent pollution at the source. The planning requirements are not meant to make companies needlessly jump through meaningless hoops, but rather are designed to help companies learn the best pollution prevention options for their individual production processes. After completing each step in the planning process, companies should be able to determine the best prevention options for their processes.

S. 1114 requires that pollution prevention plans for the facility as a whole, rather than for specific production processes at the facility. By definition, pollution prevention takes place at the production process level. Facility-wide plans are not especially meaningful for the company, or for government or the public.

S. 1114 complicates the pollution prevention planning process by requiring EPA to develop a list of 20 pollutants for which the Administrator determines discharge reductions are likely to result in a benefit to human health or the environment and by then requiring the EPA to determine those facilities that release not less than 80 percent of the volume of the 20 chemicals to waterways. This is a labor intensive process that can be avoided.

There are provisions in the section 205 of S. 1114 that we do support. S. 1114 requires that plans stay on-site and be made available to the Administrator, State and local government agencies given authority by the State. We support this provision provided that plan summaries are made public. Plans are meant to help a company develop a pollution prevention strategy and are not meant to be public documents. We also support provisions in S. 1114 that make pollution prevention plan summaries available to the public. However, Congress should specify the contents of these summaries so that there will be some consistency between plan summaries. In addition, plan summaries should be made available to the public in a manner that provides greater access.

Pollution prevention planning is an approach that has been endorsed by a broad coalition of interests ranging from environmental groups to members of industry including the Chemical Manufacturers' Association in "Water Quality 2000." Unfortunately, the Pollution Prevention Planning requirements contained in S. 1114 are less comprehensive than the principals discussed in "Water Quality 2000."

RECOMMENDATIONS FOR POLLUTION PREVENTION PLANNING

We recommend that the Committee amend the planning requirements to provide greater direction for companies. Specifically, we recommend that plans include the following:

An inventory flow of the toxic materials and wastes through their production processes. This inventory is often referred to as an estimated "materials accounting." Companies can not develop pollution prevention plans if they do not know how chemicals flow through their production processes. EPA should provide companies with guidance on how to complete a materials accounting.

An estimate of the costs associated with the use of toxic chemicals or byproduct generation, including the cost of pollution control, waste management, employee protection, and insurance. Until companies have considered the costs associated with the use of toxic chemicals or generation of hazardous byproducts, companies are not in a position to make sound decisions about pollution prevention options.

An identification of pollution prevention options, assessment their technical and economic feasibility, selection of those appropriate for implementation and pollution prevention goals.

We recommend that plan summaries include, at a minimum, the pollution prevention options selected by the company and the pollution prevention goals. In addition, we recommend that plan summaries be collected by the EPA and be made available to the public through the computerized database established under the Emergency Planning and Community Right to know Act (EPCRA, also known as Title III of Superfund).

To simplify the process, we recommend that all facilities that meet the criteria for reporting under EPCRA and that apply for a permit under section 402 of the Clean Water Act complete a plan for all chemicals on the EPCRA section 313 list and for all Clean Water Priority pollutants.

EPCRA serves as a screen by targeting only facilities that manufacture, process or use large quantities of toxic chemicals and have more than 10 full time employees. In addition, the EPCRA section 313 list of chemicals is a well established list of chemicals. By building upon the highly successful EPCRA program, Congress will not waste valuable EPA resources.

The "Hazardous Pollution Prevention Planning Act" (S. 980), introduced by Senator Lieberman and cosponsored by Senators Moynihan, Jeffords, Lautenberg, Feingold, Metzenbaum and Wellstone provides a model for pollution prevention planning in the Clean Water Act. We urge the Committee to substitute a modified version of S. 980 for the pollution prevention planning requirements contained in S. 1114.

DEVELOPMENT OF CLEAN TECHNOLOGIES

As companies begin to make the shift toward preventing pollution and away from merely controlling pollution or shifting pollution from one area of the environment to another, it is essential that we develop additional mechanisms for promoting these efforts. Incentives for the development of clean technologies are an important part of the strategy.

COMMENTS ON THE CLEAN WATER POLLUTION AND PREVENTION AND CONTROL ACT OF 1993: SECTION 601. TECHNOLOGY DEVELOPMENT.

We support the inclusion of provisions in section 601 of S. 1114 that are designed to provide grants to help develop innovative water pollution prevention and practices. We urge the Committee to ensure, however, that prevention practices are given preference over control practices where feasible. The end-of-pipe pollution control sector of the environmental technology industry is very well established. The story is quite different for the pollution prevention sector. Without specific support for the pollution prevention technologies, less favorable pollution control technologies might inadvertently be given a competitive advantage over prevention.

RECOMMENDATIONS FOR TECHNOLOGY DEVELOPMENT

We urge the Committee to ensure that pollution prevention technologies are given preference over pollution control technologies where both options exist.

ENDNOTES

1. Testimony of Dr. Theo Colburn, Senior Fellow, W. Alton Jones Foundation and World Wildlife Fund before the Senate Committee on Environment and Public Works, March 24, 1993.

2. Chemicals known to disrupt the endocrine system include DDT, DEHP (di(2-ethylhexyl) phthalate), dicofol, HCB (hexachlorozene), kelthane, kepone, lindane and other hexachlorocyclohexane congeners, methoxychlor, octachlorostyrene, triasine herbicides, EBDC fungicides, certain PCB congeners, 2,3,7,8-TCDD and other dioxins, 2,3,7,8-TCDF and other furans, cadmium, lead, mercury, and tributyltin and other organo-tin compounds.

3. *Mercury Warning: The Fish You Catch May be Unsafe to Eat*, Clean Water Fund, authored by Hank Cole, Amy Hitchcock and Robert Collins, August 1992.

4. Figures compile by Mark Floegel from Greenpeace using Pulp and Paper International Magazine, July 1992.

5. "Technical and Economic Feasibility of the Effluent Free Bleached Craft Pulp Mill," Richard J. Albert, Technical Staff Manager, Parsons Main Inc., March 1993.

6. Figures compile by Mark Floegel of Greenpeace using data found in Eurochlor, Data Process Center Statistical Investigation: Chlorine Production, January 1993.

7. The term "sunset" as used herein is synonymous with phase-out and means the ban on the use and/or production of a chemical or product over a period of time. A phase-out can either be conditional or absolute.

8. *Serious Reduction of Hazardous Waste*, OTA, 1985.

9. *Cutting Chemical Wastes*, David Sarokin, Warren Muir, Catherine Miller, Sebastian Sperber, INFORM, 1985.

10. *Environmental Dividends: Cutting More Chemical Wastes*, authored by Mark Dorfman, Warren Muir, Catherine Miller, 381 Park Avenue South, New York, NY, 1992.

Candidate List for Phaseout

We propose the following list, which is a composite drawn from four lists of highly suspect substances already developed in other contexts:¹

LIST

alkylated lead	beta-hexachlorocyclohexane; beta-BHC
anthracene	delta-hexachlorocyclohexane; delta-BHC
arsenic	alpha-hexachlorocyclohexane (a-HCH)
benzo[a]pyrene	gamma-hexachlorocyclohexane (γ-HCH)
3,4-benzoflouranthene	technical-grade hexachlorocyclohexane
benzo[b]flouranthene	hexachlorophene
11,12-benzoflouranthene	Indeno[1,2,3-cd]pyrene
benzo[k]flouranthene	2,3-o-phenylene pyrene
benzo[ghi]perylene	lindane
1,12-benzoperylene	mercury
benzo[a]pyrene	4,4'-methylene bis(N,N'-dimethyl)aniline
3,4-benzopyrene	methylbenzene
benz[a]anthracene	methoxychlor
bis(2-ethylhexyl)phthalate	N-Nitroso-di-n-butylamine
4-bromophenyl phenyl ether	octachlorostyrene
4-chlorophenyl phenyl ether	perylene
danitol	pentachlorophenol
1,2,5,6-dibenzanthracene	pentachlorobenzene
dibenz[a,h]anthracene	phenanthrene
dibutyl phthalate	phenol
di-n-butyl phthalate	photomirex
1,4-dichlorobenzene	polychlorinated biphenyls (PCBs)
3,3'-dichlorobenzidine	polychlorinated dibenzo-p-dioxins and -furans (TCDD/Fs)
dicofof	1,2,3,4-tetrachlorobenzene
ethyl-p-nitrophenylphenylphosphorothioate (EPN)	1,2,4,5-tetrachlorobenzene
hexachlorobutadiene; hexachloro-1,3-butadiene	toluene
hexachlorocyclohexane; BHC	tributyl tin
alpha-hexachlorocyclohexane; alpha-BHC	1,2,4-trichlorobenzene

¹ Here are the four lists from which the above composite was developed:

1. Candidate Substances List for Bans or Phase-Outs, April 1992, prepared by Hazardous Contaminants Branch and Water Resources Branch, Ontario Ministry of the Environment. Primary list of 21 considered inherently hazardous due to their persistence in water or sediment, potential to bioaccumulate and toxicity.

2. Great Lakes Water Quality Initiative, "Pollutants of Initial Focus in the Great Lakes Water Quality Initiative," 58 Fed. Reg. 20801, 2100015 (April 16, 1993). Listed above are those known to be bioaccumulative chemicals of concern and those that are potential bioaccumulative chemicals of concern.

3. U.S. EPA "Chemicals of Highest Concern" list. From 1991 EPA draft document called "Assessment and Control of Bioconcentratable Contaminants in Surface Waters." List of 33, including 17 pesticides, 7 PCB mixtures and 9 other organics, which pose serious risks to human health due to high toxicity and high bioconcentration potential. These substances bioconcentrate in fish and shellfish to levels hazardous to human health, even when present in ambient water at very low concentrations. However, EPA did not use any specific criteria for defining "high bioaccumulation" or "high toxicity."

4. International Joint Commission: Water Quality Board List of Critical Water Pollutants.

SWEDISH LIST OF CHEMICALS TARGETED FOR PHASE-OUT

1. Arsenic
 2. Brominated Flame Retardants
 3. Cadmium
 4. Chloroparaffins
 5. Creosote
 6. Lead
 7. Mercury
 8. Methylene Chloride
 9. Nonyl-phenol Ethoxylates
 10. Organotin Compounds
 11. Phthalates
 12. Tetrachloroethylene (perchloroethylene)
 13. Trichloroethylene
-

**ONTARIO MINISTRY OF ENVIRONMENT'S CANDIDATE
SUBSTANCES PRIMARY LIST FOR BANS OR PHASE-OUTS**

- | | |
|---------------------------------|--|
| 1. Anthracene | |
| 2. Arsenic | 13. Mercury |
| 3. Benzo(a)pyrene | 14. Mirex |
| 4. Benzo(ghi)perylene | 15. Pentachlorophenol |
| 5. Benzo(a)anthracene | 16. Perylene |
| 6. DDT (and DDD and DDE) | 17. Phenanthrene |
| 7. 1,4-Dichlorobenzene | 18. Polychlorinated Biphenyls (PCBs) |
| 8. 3,3'-Dichlorobenzidine | 19. Polychlorinated Dibenzo-p-dioxins and
-furans (PCDD/Fs) |
| 9. Dieldrin | 20. Toxaphene |
| 10. Hexachlorobenzene | 21. Tributyl Tin |
| 11. alpha-Hexachlorocyclohexane | |
| 12. gamma-Hexachlorocyclohexane | |
-

**CHEMICALS TARGETED FOR VIRTUAL ELIMINATION:
INTERNATIONAL JOINT COMMISSION**

1. Benzo(a)pyrene
 2. DDT and metabolites (DDE and DDD)
 3. Dieldrin
 4. Hexachlorobenzene
 5. Lead, Alkylated
 6. Mercury
 7. Mirex
 8. Polychlorinated Biphenyls (PCBs)
 9. 2,3,7,8-TCDD (dioxins)
 10. 2,3,7,8-TCDF (furans)
 11. Toxaphene
-

**ONTARIO MINISTRY OF ENVIRONMENT'S CANDIDATE
SUBSTANCES SECONDARY LIST FOR BANS OR PHASE-OUTS**

Group A

1. Benzo(b)fluoranthene
2. Benzo(e)pyrene
3. Benzo(i)fluoranthene
4. Benzo(k)fluoranthene
5. Beryllium
6. bis(2-ethylhexyl)phthalate
7. Cadmium
8. Chloroform
9. Chromium (Cr⁺⁶)
10. Chrysene
11. Copper
12. Dibenzo(a,i)pyrene
13. 7H-dibenzo(c,g)carbazole
14. Dibenz(a,h)acridine

TESTIMONY OF JESSICA C. LANDMAN, SENIOR ATTORNEY, NATURAL
RESOURCES DEFENSE COUNCIL, INC

INTRODUCTION

Mr. Chairman and members of the Subcommittee, my name is Jessica Landman. I am a Senior Attorney with the Natural Resources Defense Council,¹ and have been with NRDC's Clean Water Program for seven years. Thank you for the opportunity to testify on the key toxic pollution prevention and control issues addressed in S. 1114, the Water Pollution Prevention and Control Act of 1993.

We welcome the introduction of S. 1114 because it signals the Congress' recognition of the gravity of environmental and human health threats that still face our nation's waters. The bill's strong focus on toxic pollution, along with such other key issues as polluted runoff and enforcement, is altogether appropriate. Although much progress has been made in reducing the release of toxic substances to our waters since the 1972 Clean Water Act was enacted, a great deal remains to be done.

To put the problem in perspective, it may be helpful to set forth a few facts and figures about toxics and water quality impairments that NRDC recently has assembled in a review of the status of our nation's waters twenty years after the enactment of the 1972 law:²

SUMMARY: STATUS OF OUR WATERS

1. *Traditional Measures of Progress are Incomplete and Inadequate. but Show Substantial Ongoing Impairment of Surface Waters*

According to EPA's most recent (1990) National Water Quality Inventory, we have a long way to go in meeting the goals of the Clean Water Act:

At least a third of our rivers, half of our estuaries and more than half of our lakes are not meeting designated uses, that is, are not safe for swimming, fishing and other uses. Considerably fewer waters are reported as meeting these uses in 1988-89 than in 1980-81. (In part, this may reflect better monitoring and reporting.)

But these reports are incomplete. Only 53% of river miles, 69% of lake acres, and 75% of estuarine area were "assessed" for the report. And even these claims are misleading, since "assessed" does not mean "monitored" for toxic and other pollutants. The 1990 Report was based on actual chemical measurements for less than a fifth of our rivers, streams, and lakes, and about a quarter of our estuaries.

2. *New Controls have Reduced Discharges of Pollution, but We Still have a Long Way to Go*

The percent of the U.S. population served by wastewater treatment plants jumped from 42% in 1970 to 67% in 1975, 70% by 1980, and 74% by 1985. EPA estimates that annual release of organic wastes have been reduced by about 46% as a result of this improved treatment, despite a large increase in the amount of wastes treated.

Industrial pollution controls have eliminated the release of almost a billion pounds of toxic pollutants each year into the Nation's rivers, lakes and coastal waters. Even higher amounts of conventional pollutants, like organic wastes and solids, have been controlled.

Still, we continue to release hundreds of millions of pounds of toxics into our surface waters and sewage treatment plants each year from unregulated or poorly regulated industries, and discharges of raw or partially treated sewage continue unabated in many areas.

3. *Long-term Water Quality Trends Show Inconclusive Results*

Despite the existence of thousands of water quality monitoring stations around the country, very little information collected at these sites is suitable to tell us how much progress has been made in overall water quality.

The little information available to judge long-term progress shows *no significant trends* in overall water quality. Where improvements are evident, they are in pollutants such as phosphorus, reflecting investments in sewage treatment plants. Where deterioration is shown, it is from nitrogen, sediment, and other pollutants characteristic of polluted runoff from farms and other lands.

¹ NRDC is a nonprofit environmental organization representing approximately 170,000 members nationwide. NRDC has been involved in each major overhaul of the Clean water Act, and has monitored implementation of the law at the Federal, regional and state levels since 1972.

² Documentation for the facts presented herein is available from NRDC and is contained in NRDC's forthcoming book.

4. "Real-World" Measures Show Some Progress but Serious Problems Remain

a. Many Waters Remain Unsafe for Swimming

In 1991, U.S. ocean and bay beaches were closed or advisories issued against swimming on more than 2000 occasions in coastal states that monitor beach water quality. High bacteria levels were responsible for the overwhelming majority of closures. Over 5,000 closures or advisories have occurred since 1988.

State water quality reports confirm that a quarter of our rivers and estuaries, a fifth of our lakes and ten percent of coastal waters remain unsafe for swimming.

b. Many Drinking Water Supplies Remain Jeopardized

The recent illnesses caused by Milwaukee's drinking water are not isolated. Reports from the Centers for Disease Control identify 525 disease outbreaks related to public water supplies from 1972-1988, affecting over 131,000 people. These numbers are conservative; some researchers believe that 25 times as many drinking water-related illnesses occur than are reported.

Between 27% and 30% of community drinking water systems reported violations of health-based standards from 1986-91.

c. Many Sources of Fish and Shellfish Remain Contaminated

In 1990, 31 states reported toxic contaminants in fish at levels exceeding action levels set by the Food and Drug Administration. Forty five states reported almost 1,000 fishing advisories in 1988-89, and another 50 complete fishing bans, due to pollutants such as PCBs, pesticides, dioxin, mercury, other metals, and other organic chemicals. These warnings affected over 7,000 river miles, almost 2.5 million lake acres, over 800 square miles of estuaries, and almost 5,000 miles of shoreline in the Great Lakes. EPA acknowledges that these reports are incomplete, and that state criteria for issuing advisories vary widely.

National data bases show some declines in chemical contamination of seafood, but increases and serious remaining problems for some chemicals, particularly in urban waters and other heavily-polluted areas. In a report released by EPA last year, almost half of the chemical forms of dioxins and furans, and a third of the other chemicals measured, were found at over half of the sampling locations. PCBs, biphenyl, mercury and DDE were found at more than 90% of the test sites. And every pollutant in the study was found in at least one location. EPA calculated that the levels of pollutants measured in fish around the country posed significant risks of cancer and other health effects for average fish consumers, and even higher risks to subsistence and recreational anglers who consume more fish from contaminated waters. Information is available, however, for only a handful of chemicals.

Sewage contamination of shellfish, however, is getting worse. The National Shellfish Register shows a 6% increase in estuarine waters closed to shellfish harvest from 1985 to 1990. By 1990, less than two thirds of our shellfish waters were unconditionally approved for shellfish harvest.

d. Aquatic Species are in Serious Jeopardy

Many more aquatic species are threatened and endangered than their terrestrial cousins: 73% of mussels, 65% of crayfishes, 34% of fishes, and 28% of amphibians are jeopardized compared to 13% of mammals, 11% of birds, and 14% of reptiles.

Between 1979 and 1989 the American Fisheries Society added 139 and removed 26 categories of fish from their list of threatened and endangered species, producing a total of 364 fishes that warrant protection due to rarity. *Not a single species was removed from the list due to successful recovery efforts, while 10 were dropped because they became extinct.*

e. Many aquatic and water-dependent populations are plummeting

Between 1970 and 1989, harvest of oysters dropped by 44% and landings of spiny lobster declined by 34%.

Commercial landings of striped bass have declined continuously since 1973, with a fall of 92% since 1982.

Between 1983-89 landings of bay scallops fell by 88%. Scallop landings also dropped by 50% from 1975-85, with catch per unit effort in 1985 reaching historic lows.

Duck breeding populations in North America dropped continually from 1955-1985. More recent data suggest that this trend has not been reversed. The ten species with over 97% of North America's breeding populations showed declines of 34% from 1970 to 1989.

According to data from the FWS Breeding Bird Survey, which has recorded flight records since 1966, a significant number of water-dependent species have declining population trends.

f. Pollution Continues to Cause Massive Fish Kills and Other Adverse Effects to Fish and Wildlife

From 1972-1989, EPA estimates that at least 429 million fish were killed in almost 10,000 incidents. (These data *under-represent* number of fish kills for several reasons.) The numbers of fish kills each year do not appear to be declining significantly.

From 1980 to 1989, NOAA reports over 3,650 fish-kill events in 533 coastal and near coastal counties in 22 states. These events involved over 407 million fish killed. In general, the total number of reported fish kills increased during the 1980s, but the average numbers of total fish killed per year declined.

Taken together, NRDC estimates that at least 1.35 billion fish have been killed in inland and coastal waters combined since the Clean Water Act was passed.

Pollutants continue to be released into our aquatic environments at levels that are toxic to aquatic species and to birds, mammals and other predators that consume contaminated fish. Studies in the Great Lakes indicate that toxic pollutants cause population declines and reproductive problems, birth defects, behavioral changes, sexual changes, and increased susceptibility to disease.

In sum, the Clean Water Act has not thus far succeeded in achieving the goals we established in 1972 for fishable, swimmable waters and an end to the discharge of toxic pollutants. S. 1114 takes a number of important steps towards closing key loopholes in the toxics safety net. Below we provide comments on Title II, "Toxic Pollution Prevention and Control."

Overview

Over the past two years as the Congress began the process of reauthorizing the Clean Water Act NRDC has emphasized in our analyses the urgent need to better incorporate pollution prevention concepts into the language and implementation of the law. We have stressed the need to "sunset" or phase out the release of the most harmful toxic chemicals; to streamline and overhaul the effluent guidelines and pretreatment program to make them responsive to pollution prevention and cross-media pollution issues; and the importance of pollution prevention planning in reducing or eliminating toxic pollution. We are pleased that all these issues have received attention in the Committee's bill, and look forward to working with the Committee to refine the legislation still further in the coming months as the bill moves through the legislative process.

I. Point Source Technology-based Controls

One of the principal means for achieving the Clean Water Act's goals of ending the discharge of toxic pollutants to surface waters and sewage treatment plants is the system of national technology-based standards for wastewater treatment and control: Best Available Technology (BAT) and New Source Performance Standards (NSPS) for facilities discharging to surface waters, and Pretreatment Standards for Existing Sources (PSES) and New Sources (PSNS) for those industries discharging wastewaters to sewage treatment plants. Since 1972 the intent of Congress has been that these standards would be continuously updated, moving whole categories of industries ceaselessly forward toward the law's zero-discharge goal through advancements in technology.

NRDC has testified before this Committee earlier on the potential that the system has to work effectively, and the failures of the EPA in the past decade to live up to the law's technology-forcing mandate. Rather than revisit that testimony here we include a copy and ask that it be placed in the record.³ This testimony will be limited to a review of the proposals contained in S. 1114.

S. 1114 tackles some key concerns in the technology-based standards program: the *need for a pollution prevention focus* for national standards, the *importance of cross-media pollution*, and the *need for resources* to keep the program from becoming out-of-date and moribund. In addition, the simplification of standard setting achieved by treating toxic, conventional and nonconventional pollutants alike, will make EPA's job far easier and cheaper. We salute each of these proposed reforms.

³ "Testimony of the Natural Resources Defense Council, Inc. before the Subcommittee on Environmental Protection of the Senate Committee on Environment and Public Works," July 9, 1991, submitted by Jessica C. Landman, Senior Attorney, NRDC.

POLLUTION PREVENTION IN NATIONAL STANDARD-SETTING

We strongly support revision to the language of sections 304, 306, and 307 of the Act which would clarify EPA's authority to set national standards that advance reliance on pollution prevention rather than a strict end-of-the pipe focus—a focus that unfortunately has been the hallmark of too many earlier standards. The bill would make explicit EPA's duty to "rely upon and require, to the maximum extent practicable, *source reduction measures and practices* including changes in production processes, products, or raw materials that reduce, avoid, or eliminate the generation of toxic or hazardous byproducts . . ." for national technology-based standards. The bill would also expressly "require the elimination of the discharge of pollutants" where technologically and economically achievable, language that is an unmistakable mandate to the Agency to stick to the zero discharge focus of the law.

There are some minor areas in which clarification is needed to ensure that the intent of Congress is clear. For example, additional clarification is needed that new sources (whether direct or indirect) will continue to be subject to standards that may go beyond those achievable by existing facilities.

Cross-media Pollution

In the past EPA has declined to exercise its authority over the Clean Water Act to prohibit industries from selecting technologies that could meet effluent limits through shifting of pollution impacts to other media—such as use of polluting air stripping to "remove" volatile organics from wastewater in the organic chemicals industry. Proposed revisions to sections 304, 306 and 307 would make clear EPA's responsibility to prevent such waste-shifting. Another welcome addition is the express mention of ground water and the duty to protect this vital resource against waste shifting.

The Need for Resources

EPA's ability to keep the standard-setting process on track has been hampered by a lack of resources. In keeping with the philosophy that the polluter should pay for the cost of cleanup, we support the provision of S. 1114 that calls for the collection of fees from direct and indirect dischargers to cover the costs of developing these national standards. There are some ambiguities in the bill that require clarification, such as the timing of assessments and the question of who must contribute, but these issues are not easily resolvable.

Pretreatment Standards: Time for a Change

Since 1986, two major EPA studies of the effectiveness of Publicly Owned Treatment Works in treating toxic pollutants have cast doubt on the ability of these facilities to do the job on a consistent basis.⁴ This is not surprising; POTWs are designed to treat conventional rather than toxic pollutants. Treatment of toxics that they do achieve can be inconsistent, and often is illusory—more a matter of shifting the substances from water to air or sludge. For these reasons we strongly support the proposed revisions to section 307(b) which would make technology based pretreatment standards for toxic pollutants equivalent to standards for direct dischargers. (Many of the same reasons that argue for stronger pretreatment standards also argue against a continuation of the "removal credits" program, which allows industries to increase their discharges of toxic pollutants to POTWs under certain circumstances. The relevant provision of the bill is discussed below in the context of the Pretreatment Program revisions.)

A Remaining Gap: The Rulemaking Schedule

A key issue that is not adequately addressed by S. 1114 is the schedule for the review and revision of all effluent guidelines, pretreatment and new source performance standards.

Under existing law, a variety of timetables apply: "annual review and, where appropriate, revision" for BAT standards under section 304(b); revision 'from time to time' for pretreatment standards under the current language of section 307(b). Various provisions in the bill would eliminate these requirements, as well as the provision calling for "annual" review and revision of existing guidelines that currently is in sec. 304(m)(1)(A). Taken together, these deletions leave the timetables for revision of existing guidelines completely to Administrator discretion (except that a plan for

⁴ "Report to Congress on the Discharge of Hazardous Wastes to Publicly Owned Treatment Works," US EPA, Office of water Regulations and Standards (February 1986); "National Pretreatment Program: Report to Congress," US EPA, Office of Water (July 1991).

future revisions must be written every 5 years). Given our past experience,⁵ we are concerned that the plans EPA may develop will not be ambitious enough to continue to advance pollution prevention goals. We therefore recommend that language be included in section 304(m)(1)(A) calling for mandatory review of existing guidelines on a predictable cycle (such as every five to seven years) and, where appropriate, revision of the guidelines and pretreatment standards.

Triggers for Revising and Updating Standards

The bill would be further strengthened by adding new "teeth" to the provision requiring the Administrator to revisit guidelines as pollution prevention advances occur. As currently framed, the Administrator has broad discretion to decide whether there have been "significant changes" warranting a revision of effluent guidelines. The bill should include triggers ensuring that certain data sources are reviewed that would highlight such changes and bring them to the EPA's attention. It should require the Administrator to evaluate, at a minimum: (i) innovations that have resulted from water quality-based permitting pursuant to 301(b), and (ii) TRI data indicating a trend of significant reductions in releases (to any medium) by a category of industry. Finally, the bill should include a judicially reviewable petitioning process enabling interested parties to seek revisions.

It also would be advisable, throughout sections 304, 306, and 307, to cross-reference EPA's duties under the Pollution Prevention Act (42 USC sec. 13103(b)) to coordinate Agency-wide activities that promote pollution prevention; this could change an otherwise applicable schedule in water program rulemaking so that cross-media impacts could be better addressed (as with the pulp and paper rulemaking cluster).

II. Water Quality Criteria and Standards

Water quality standards for toxic pollutants are the second key component of the overall Clean Water Act framework: they define healthy ecosystems and establish targets for permit writers and for those seeking to control polluted runoff. As with the effluent guidelines program, EPA's water quality standards development process has been in low gear for a number of years. Congressional action is badly needed to get the program back on track. For years environmentalists and others have urged EPA to develop criteria to fill key knowledge gaps, particularly for pollutants that are of concern in runoff and in contaminated sediment. The bill takes some important steps in this direction.

The legislation proposes to use the same technique as was applied in 1987 for effluent guidelines: allow EPA to set its own priorities, but require that the agency develop a plan of action for the drafting of water quality criteria. We agree, up to a point: a plan clearly is needed, and EPA should have a modicum of discretion in deciding on the pollutants that will be high priorities for the development of water and sediment quality criteria. However, a measure of additional Congressional direction still is needed:

Sediment Quality Criteria

We strongly support the addition of explicit mention of sediment in the environmental effects that must be considered in developing criteria documents. This will lend clear Congressional support to development of sediment quality criteria.

But Congress should give EPA clearer direction as to which criteria to develop first. In addition to PCBs and dioxins (already cited in the bill), certain metals and other compounds in sediments are ubiquitous and/or pose a very high risk to humans and aquatic ecosystems, and thus should be high priorities for EPA's criteria program. The bill should *set these substances out explicitly and establish a timetable for promulgation in the first planning round*. After that, discretion can be given the Agency to set priorities. The mandatory list should include, in addition to PCBs and dioxins, the following: mercury; PAHs; copper; cadmium; lead; arsenic, and ammonia.

Nonpoint Source Water Quality Criteria

Similarly, we welcome the requirement that, within 3 years, EPA promulgate water quality criteria specifically directed at polluted runoff sources. The bill needs to clarify that this responsibility exists independent of the cyclical planning process, and requires immediate resource commitments.

⁵ NRDC has on two occasions taken EPA to court to compel the Agency to carry out statutory mandates for development of effluent guidelines.

Wildlife Criteria

Development of water quality criteria to protect wildlife should be incorporated into the planning process expressly. Particularly for bioaccumulative substances, raptors and fish-eating mammals are at great risk from contaminated fish consumption.

State Water Quality Standards

The 1987 amendments to the Clean Water Act reflected Congress' frustration with the States' failure to adopt water quality standards for toxic pollutants and put them to use in permit-writing and evaluation of water quality. Yet, despite the fact that Sec. 303(c)(2)(B), enacted in 1987, *required* States to adopt numerical water quality standards for toxics that impaired or threatened their waters, a dozen States failed to act by 1992—and EPA was compelled to step in and issue Federal standards in those states. This bill now takes the next logical step to avoid this type of unacceptable delay in future, by calling for automatic classification of State waters where States fail to fill remaining classification gaps, and automatic applicability of Federal water quality criteria in the absence of State objections. We endorse these concepts, but believe some clarifications are needed.

First, the bill should clarify that a State which chooses to "object" to a Federal criterion and adopt its own cannot establish an alternative criterion that is less protective than the Federal 304(a) criterion. Second, the inter-play between State- and federally-adopted criteria requires clearer explanation to avoid confusion.

Antidegradation

The mandate to maintain the existing water quality of waterways that are still pristine has been a part of the Clean Water Act since its inception, and was made explicit in the 1987 amendments to the law. Yet, virtually all States still lack coherent programs to implement EPA's antidegradation regulations. A ringing endorsement of the importance of keeping clean waters clean, and protecting our outstanding natural resource areas from encroachment, is badly needed from the Congress.

Thus, we strongly support inclusion of a clear Congressional mandate for antidegradation in the law (as well as the interweaving of sediment quality into the concept of antidegradation). This provision will end all further debate as to the authority and duty of States and EPA to act in this area. We also strongly support the provision in the bill aimed at protecting outstanding national resource waters in parks, refuges, etc.—as far as it goes.

But a few changes are needed in the bill to ensure that the law's goals are enhanced:

First, the bill must close the loophole of pollutant by pollutant "downgrading." Some states have tried to declare that a water body was not subject to antidegradation review if *any one pollutant* was not meeting or exceeding applicable water quality standards. The bill should clarify that this is not a correct interpretation of the law. In other words, antidegradation review should be triggered on a parameter-by-parameter basis whenever anyone wishes to degrade water quality in a body of water that is cleaner than the applicable standard for that substance for which the increased discharge is sought.

Second, the bill should answer the key question: How much reduction in water quality may be allowed? The bill should include a sentence spelling out that "*any reduction in water quality or sediment quality must be kept to the lowest level possible that can accommodate the important economic or social development.*" This will foreclose the temptation to use an antidegradation review to justify unnecessarily sweeping degradation.

Finally, antidegradation reviews must be made meaningful tools in the avoidance of polluted runoff degradation as well as point source degradation in pristine areas. Antidegradation reviews today typically are triggered (if at all) only by the application of a permittee for new or increased discharges. The bill should call for EPA to develop, and the States to implement, a policy for triggering such reviews when new or increased landdisturbing activity is likely to cause increases in polluted runoff to high quality waters.

Outstanding National Resource Waters

The legislation makes some very important advances in the protection of enactment national resource waters. We strongly support the adoption of a process that requires States to set aside these waterways for protection, or at least provide a clear and convincing rationale why this should not occur.

But several important refinements are needed to this section. First, *State* parks, refuges, etc. should also be presumptively included in the Outstanding classifica-

tions, with the same option for the State to make a case against their inclusion. Similarly, waters feeding a public water system that has been granted a waiver from filtration requirements of the Safe Drinking Water Act should be presumptively included.

On the other side of this coin, presumptive inclusion of designated Wild and Scenic Rivers should be limited to waters classified as wild or scenic, but not to those included in the system under the "recreational" rubric; these tend to be less-pristine urban waterways.

Mixing Zones

We strongly oppose the inclusion in the bill of a provision that authorizes the use of mixing zones for toxic substances. Inclusion of such a provision actually weakens current law, which does not specifically recognize the acceptability of mixing zones.

If this provision were revised to refer only to conventional pollutants, we would be willing to accept it; as currently written, we would prefer that it be deleted altogether.

III. Toxic Pollutant Phase-Out

The revision of section 307 to facilitate the prohibition of discharges of toxic or bioaccumulative substances will help to focus attention on this problem, and we welcome that focus.

But as written the revisions contain a fatal flaw.

Most important, the bill's new limitation that a substance, to be eligible for a prohibition, must "occur in surface waters predominantly as a result of discharges" (new sec. 307(a)(4)(B)) must be reconsidered. It would effectively offer dischargers an invitation to show that someone else—even their own facility's smokestack—was releasing more of the substance to a medium other than water. We cannot accept this restriction on the availability of effluent prohibitions for the following reasons:

First, the proposed requirement that prohibitions be only for 'predominantly discharged toxics effectively encourages medium shifting from water discharges to other media. This runs counter to a key goal for revising the Clean Water Act: *discourage the toxic shell game*. The Clean Water Act revisions should be the first important step in *closing* the medium-shifting loophole; this proposal moves in the *wrong* direction.

Second, if EPA has to show that it knows the "predominant" method of release of a substance it will have to fight endlessly to prove that 50.1% of releases occur through point source discharges before it can act.

Third, even if only a fraction of total environmental exposure occurs as a result of water discharges, this is not a reason to hamstring EPA's ability to go after that known, and controllable, fraction—particularly in cases where we know that current exposure levels are at or near imminent risk levels for the population at large.

If the concern is that too many resources will go into eliminating too small a fraction of the risk posed by a substance that is highly toxic but is not principally released through discharges to water, then we should seek to fashion a better mechanism for getting at that problem. After all, releases to other media (air, solid waste/soil) ultimately can and do become important sources of water contamination. While it is more difficult to get a such second-hand dischargers' *directly* through a discharge prohibition under the Clean Water Act, we should use this reauthorization to move in the direction of multi-media toxic use and release reduction.

This bill should encourage creation of multi-media approaches (like EPA's lead cluster)—including remediation for in situ contamination—as part of the effluent prohibition process in those instances where direct discharges are not the principal source of contamination. Perhaps this can be accomplished by creation of a process for identifying all sources of releases of listed substances, and recommending to the Congress legislative or regulatory revisions to this or other laws necessary to prevent or remediate releases to other media.

Report on Developmental Effects

We very strongly support the provision in S. 1114 that calls upon EPA to conduct a study of the effects of toxic pollutants on the development of aquatic species, humans and wildlife, including impairments to reproduction, endocrine and immune systems caused by the pollutants. We recommend that it be enhanced by calling for consultation with other relevant Federal agencies such as the National Institute for Environmental Health Services, and the Fish and Wildlife and National Marine Fisheries Services—and that the report include recommendations on any needed changes to Federal government risk assessment techniques to better account for non-cancer health and ecological effects.

IV. Pretreatment Program

Pretreatment Standards for Otherwise Non-Participating Facilities

We do not oppose creating explicit authority for the Pretreatment Approval Authority to impose pretreatment requirements on industrial users not otherwise part of the program, as this bill does in section 204(a). But it should be noted that EPA has the authority (and the duty) to see to it that all POTWs that need pretreatment programs do develop them, regardless of size or other factors.⁶ Along the same lines, all dischargers in categories for which national pretreatment standards have been adopted must obey those standards, whether or not the receiving POTW is in the Pretreatment program—and general discharge prohibitions against corrosive, explosive and fume-toxic discharges also apply to all industrial users under existing rules. For these reasons, it is unclear how the new provision would work.

Removal Credits

Removal credits are far simpler in theory than in practice. Theoretically, some national pretreatment standards might impose “redundant” treatment requirements on industrial facilities because the POTWs receiving their wastes are capable of treating their toxic pollutant discharges. Therefore, in theory, these industries should be allowed to have “credits” for the pollution treated by the POTW.

In practice, it is not so simple. As noted above in this testimony, POTWs rarely if ever can provide a documented, consistent level of treatment to toxic pollutants. In addition, toxics often are not fully treated (biodegraded) but instead are partitioned to other media (metals to POTW sludge, volatile toxics to the air).⁷

The revisions to the removal credits section of the law proposed in S. 1114 acknowledge these difficulties by narrowing the availability of such credits to substances that are *actually* biodegraded at the POTW. This is an important improvement over existing law; however, it leaves many questions unanswered—and leaves EPA with an extremely resource-intensive job to do in determining whether removal credits should be granted.

For example, it requires EPA to “determine” whether the “treatment by the treatment works results in the biodegradation of the toxic pollutant.” Does this mean 100% degradation? Who provides the proof? EPA would have to make a determination; would it be made via national rule/guidance, or on a case-by-case basis?

Other problems with removal credits would still remain. What happens if the POTW is subject to combined sewer overflow problems—so that rainfall results in no POTW treatment for some time period? In short, the administration of the program would remain very cumbersome.

We continue to support the approach taken in earlier draft legislation from this Subcommittee—simple elimination of removal credits. Apart from its environmental benefits, this action would allow seven of the most incomprehensible pages of the Code of Federal Regulations to be deleted.

Domestic Sewage Exclusion

As with the removal credits issue, the Domestic Sewage Exclusion had its roots in the idea of avoiding redundant regulation: substances regulated adequately under the Clean Water Act (through the pretreatment program) should not be subject to dual regulation under the Resources Conservation and Recovery Act. The problem has been that the scope of the Exclusion has far exceeded the reality of Clean Water Act regulation. Only a handful of hazardous substances in a handful of specific industries otherwise subject to RCRA actually have been regulated under the Clean Water Act.

For this reason, we agree strongly with the authors of S. 1114 that the exclusion from RCRA coverage should be narrowed to cover only those hazardous wastes that are in fact subject to meaningful coverage under the Clean Water Act. Therefore, we support these revisions. It is appropriate to give a five-year phase-in to this narrowing provision for upcoming effluent guidelines and pretreatment standards, to avoid short term regulatory confusion.

V. Pollution Prevention Planning

Although the nation remains largely reliant on mediaspecific statutes for the prevention and control of toxic pollution, in the past several years (through such actions as the adoption and implementation of the Pollution Prevention Act) Congress

⁶ See 40 CFR § 403.8(a).

⁷ See “National Pretreatment Program: Report to Congress,” U.S. EPA, (July 1991) at Ch. 4.

and EPA have begun to move towards a more universal mechanism for encouraging the generators, users and disposers of toxic materials to avoid problems before they occur. In reauthorizing the Clean Water Act it is crucial that Congress continue to move towards a multi-media approach to pollution prevention, even in the context of what remains largely a single medium bill. Pollution prevention planning for dischargers to surface waters and POTWs is an appropriate and logical next step along the way. We strongly support the provision in S. 1114 that requires certain industrial facilities to conduct pollution prevention planning, goal-setting and reporting on achievement of those goals.

We also look forward to a careful evaluation of Senator Lieberman's pollution prevention planning legislation, for possible integration into the Clean Water Act package.

The substantive content of the plans spelled out in proposed new subsection 308(f)(3)—pollutants covered, establishment of goals, annual reporting, availability of plan summaries, inclusion of water use efficiency—are very positive. We do urge one essential addition to the bill's mandate: namely, that the plans should be developed on a *production unit basis* within the facility.

There are some additional clarifications and refinements needed, which are spelled out below:

First, who is covered by the planning requirements? We support a requirement that pollution prevention planning be undertaken by all 402-permitted facilities and indirect discharging facilities who are required to report under the Emergency Planning and Community Right-to-Know Act. This will capture the largest facilities first, and the numbers of reporting facilities will expand in an orderly fashion as the EPCRA requirements extend to smaller quantity releasers and additional chemicals and categories of facilities.

If we understand the bill correctly, EPA will issue regulations specifying who will be covered by the planning requirements within two years. Also, EPA will publish a list of at least 20 substances where discharge reductions are likely to be beneficial, and will have to ensure that 80 by volume of these 20 substances are covered by plans. What is unclear is whether EPA's rules can capture dischargers of substances other than the key 20 so identified. Is the "key 20" simply intended to help EPA target certain facilities should be covered? Can EPA extend its requirements to other EPCRA-reporting facilities under the bill? We urge that the bill simply spell out that the EPCRA reporters be covered at a minimum, and as a supplement impose the "key 20" requirement as an added mechanism for making the planning effort productive.

Furthermore, the question of which indirect dischargers will be covered requires clarification. As drafted, the bill refers to parties who "appl[y] for" local limits. In general, indirect dischargers do not actually apply for such limits but are subject to their imposition from the pretreatment program authority.

Finally, which pollutants are covered? As we read the bill, all 307(a) substances reported under EPCRA are the subject of these plans—but EPA is to pick the "key 20" substances for planning/reduction on a parallel track of sorts. Must the "key 20" also be 307(a) toxics? It seems logical to ensure this "feedback loop" occurs with the revisions to 307(a) made in section 202 of this bill.

VI. Innovative Technology

We support inclusion of the provision in section 502(h) that would replace the law's existing clause allowing compliance deadline extensions for innovative/alternative technologies.⁸ This bill would create a special waiver from otherwise applicable permitting requirements to allow experimentation with innovations in technology. It should assist facilities that want to conduct experiments but are concerned with potential permit exceedences. The provision contains appropriate safeguards to prevent abuse (such as the short duration of the waiver and the requirement that water quality standards be achieved).

Conclusion

With only a few important exceptions noted herein, we are pleased to see the direction in which S. 1114 advances pollution prevention in the effluent guidelines, pretreatment, planning and standard-setting arenas. We look forward to working with you further on the legislation over the coming months.

⁸ Clean Water Act Sec. 301(k).

WRITTEN TESTIMONY OF DR. JEFFREY SILLIMAN, AMERICAN TEXTILE
MANUFACTURERS INSTITUTE

Senators, thank you for soliciting the advice of the American Textile Manufacturers Institute specifically and those of us in the industrial community regulated by the Clean Water Act in general. My name is Dr. Jeffrey Silliman, and I chair the ATMI Environmental Preservation Water Subcommittee as well as manage environmental affairs for Milliken & Company, headquartered in Spartanburg, South Carolina. I, like those with me today, feel we can speak to the front-line successes and shortcomings of the Act, and appreciate the opportunity to testify today. Given that textile facilities are in located in many small to medium-size communities, such as those found in many of your own states, I'm sure you will be able to relate to many of my comments.

Generally speaking—

- *Don't rewrite the Clean Water Act.* Simply reauthorize it and make whatever minor revisions necessary. EPA already has numerous responsibilities from the 1987 reauthorization on which to act. Moreover, it has plenty of existing authority on which to act to protect the nation's waterways and the health and environment of the general public.

In addition, it should be noted that EPA's Office of Water faces significant funding cuts and staff reductions in the upcoming fiscal year and need not be hindered with new responsibilities. With fewer new responsibilities, EPA's Office of Water could focus instead on developing criteria and guidance documents based on *sound science* that are respected by the environmental and regulated communities alike and that are less likely to be challenged in court.

As you rewrite S. 1114 to make it a more widely accepted reauthorization vehicle, I hope this advice will remain foremost on your minds, particularly given the major reauthorization and funding battles that lie ahead concerning RCRA, Superfund, and numerous other federal environmental statutes.

As for specific provisions of the bill, I will be addressing various issues of particular concern to ATMI and the domestic textile industry and will discuss them in order of their importance to the industry.

Water-Quality Issues

- *Congress should refrain from adopting any new and arbitrary provisions aimed at reducing toxic substances until the water-quality program that Congress enacted in the 1987 Act has been given the opportunity to be fully implemented and refined—both scientifically and administratively—by EPA and the states, and results have been given a fair opportunity to be realized.*

The success of the effluent guidelines program, intended to clean up point-source discharges with advanced technology controls, has been acclaimed almost universally in Congress, EPA, the regulatory communities and elsewhere. Less than fifteen percent of remaining water-body contamination can be attributed to point-source pollution, according to EPA.

In 1987, Congress called upon EPA to address remaining toxic water problems through the creation of a risk-based water-quality program. Under the program, states would be asked to identify the various uses of the water bodies within their boundaries—be they recreational, residential, commercial, agricultural or industrial—as well as to identify the toxic "hot spots" and pollutants of concern. EPA would develop acceptable risk levels or water-quality criteria for these pollutants. States then could adopt these water-quality criteria as state water-quality standards and incorporate them as limits into permits for dischargers on these sensitive water bodies. Compliance with these permit limits came due just this past year, however, due to delayed program implementation in some states, the success or failure of the program is, for the most part, still outstanding.

Where states haven't acted, EPA recently issued the National Toxics Rule stipulating that EPA's water-quality criteria automatically would become the water-quality standards in those states. Compliance is due within the year.

All of this has taken place within the last six years. Thus, the "verdict is still out" on how successfully the water-quality program instituted under the '87 Act has eliminated toxics. And, to adopt any new, far-reaching provisions to do the same is premature and cannot be scientifically justified. Let's continue to focus the nation's limited resources on refining the existing program to ensure results before moving ahead and adding another.

- *Moreover, Congress should refrain from adopting any new toxics provisions that take a national approach and fail to recognize the site-specific nature of ecosystems and the much-needed state and local flexibility to address them.*

S. 1114 significantly reduces the discretion and flexibility of states to act as they see appropriate given the community's needs and environmental interests. Mandatory water-quality numeric standards (versus narrative), national pretreatment guidelines, widespread toxics bans and the like advocated in the bill limit the options states and localities may identify and develop.

Moreover, these provisions convey a very paternalistic message that "Congress, not States, knows best." One of the fundamental elements of the nation's environmental statutes is state autonomy and flexibility, and S. 1114 reduces it to a pithy political platitude.

- *Congress continually focuses on "toxics"—anything can be toxic's at certain doses. Congress instead should focus on "bioavailable toxic's" and in doing so, assist EPA in being more resourceful with its limited resources.*

Simply stated, by focusing on bioavailable toxics, EPA can focus on toxics that present a risk to human health and/or the environment versus those that don't.

- *Scientific over generalizations can lead to costly economic consequences. Sound science is needed to justify action.*

As previously mentioned, in the '87 Act, Congress instructed EPA to issue water quality criteria for numerous substances at toxic levels. When issuing these criteria for toxic metals, however, EPA failed to take into account the diverse forms of various metals and that not every type or form of a metal, say copper or silver, are bioavailable to present a risk to human health or the environment. Lacking good scientific data, nevertheless, EPA proceeded in issuing water-quality criteria for metals by generalizing that all metals are bioavailable and toxic and by using overly conservative assumptions, resulting extraordinarily low metal limits being incorporated into permits.

What I am talking about? Corroding pipes, naturally-occurring metals, and the commercial use of various products containing metals—from copper to chromium, mercury to manganese, and zinc to lead. These metals are present in the municipal and industrial discharges to our nation's waterways.

There's not a member of this Subcommittee that doesn't have a constituent interest here—be it a copper mine outside of Billings, Montana; a jewelry manufacturer in Providence, Rhode Island; a photo-finisher in Utica, New York; a dentist in St. Paul, Minnesota; a computer manufacturer in San Jose, California, a textile plant in Hickory, North Carolina; a steel mill outside Pittsburgh, Pennsylvania or a municipal wastewater plant in Newark, New Jersey. Pennsylvania—they're all subject to extremely low metal limits that are pose extraordinary costs to meet.

- *Because of the prevalence of facilities impacts by EPA's water-quality criteria for metals and the excessive cost incurred by municipalities and industries nationwide for treating metals to these low limits, Congress should amend the Clean Water Act to address "bioavailable" toxics.*

A case in point: One textile company has spent upwards of \$300,000 and four years demonstrating to the State of South Carolina that the metal in textile dyestuffs, in this case copper, is not bioavailable nor toxic and therefore the state environmental agency should not use EPA's stringent criteria for copper in developing discharge permit limits for the form of copper present in this facility's effluent.

Because the metals exists, however, in all likelihood, the company will see a metal limit in the fraction of a part per million range in its permit that will require treatment and operating costs involving thousands of dollars annually but will have minimal, if any, environmental benefit because the copper chemically is not bioavailable to harm human health or the environment.

- *Moreover, Congress also should require EPA to undertake its desired scientific review of its metals criteria within the next 12 months and act upon its findings within the next 24 months.*

In January, ATMI participated in an EPA metals workshop where experts reviewed the Agency's controversial metals criteria and discussed the textile industry's predicament in particular. The experts recommended to EPA, and the Agency has concurred, that more research is needed, but due to funding cuts, may never be initiated or, if so, in the far-distant future—as businesses and cities go bankrupt trying to comply.

To mitigate any further costs from its controversial metals criteria, Congress should mandate that EPA focus on bioavailable toxics that present a real, scientifically justified risk to human and the environment, and stipulate that the Agency act on their proposed metals studies in the near, rather than long, term. U.S. competitiveness and municipal solvency is at stake.

- *Finally, Congress also should require EPA to use the rule-making process, and specifically the Advanced Notice of Proposed Rule-making (ANPRM), to notify the regulated community that it is investigating and preparing a rule or guidance, particularly the latter, that might affect them and that they can come to the Agency prior to anything ever being written and demonstrate why the guidance would not apply to them or how the EPA's approach to implementation might be flawed.*

Presently, public notification is required for the proposal and issuance of only rules, not guidances, and even then by the time something is in writing, it is difficult to alter EPA's position. Requiring an ANPRM for every proposed rule and guidance would reverse the Agency's tendency to regulate first, de-regulate later, and save the regulated community and EPA much time, effort and money in correcting its overly-conservative assumptions and past mistakes. The Agency's water-quality criteria for metals, previously mentioned, provide an example of how an ANPRM could have prevented the problems that later beset the domestic textile industry.

Effluent Guidelines

- The overlapping interests and requirements of the Clean Water Act, the emergency Planning and Community right-to-know Act, the Pollution Prevention Act, the Oil Pollution Prevention Act and other federal environmental statutes ensures that regulated industries and municipalities are continually reviewing their operations and incorporating pollution prevention concepts and programs—for environmental as well as financial reasons.
- Similarly, we agree with the bill's provisions to incorporate pollution prevention concepts into the development of effluent guidelines, where appropriate, and to ban the transfer of pollution across media. These are concepts that already are in practice throughout industry and at EPA.
- ATMI is staunchly opposed to any mandated detailed review and control of industrial operations, as proposed in S. 1114.

By proposing such requirements, Congress fails to recognize the environmental progress and pollution prevention progress that companies are making every day.

Moreover, Congress is assigning EPA an enormous responsibility for which it has neither the manufacturing expertise, financial resources or manpower to undertake. Clearly, there is a lack of appreciation for the number and diversity of products in all industries, including the textile industry, and the processes that would have to be identified and controlled.

Generally speaking, if a facility is in compliance with all environmental requirements, such intrusions into its normal business operations is not called for.

- Finally, given the widely acclaimed success of the effluent guidelines program in cleaning up point-source discharges and given the fact that less than 15 percent of remaining water contamination problems can be attributed to point-source discharges, perhaps the Congress should focus the nation's limited resources on the primary source of remaining water contamination, namely non-point sources.

Mixing Zones

- Congress should retain mixing zones in order to accurately assess the true impact of discharges on a water body and to allow nature to act on its innate capacity to assimilate.

In many instances, for example, with treated textile effluent from a weaving mill, nature has as innate capacity to assimilate and handle the discharge from the facility. In fact, biological wastewater treatment systems—the type most frequently found within the textile industry—are modeled after nature itself. To determine whether or not a discharge impacts a water body, however, industry and municipalities—more the latter—need mixing zones. Without them, we must rest on generalizations from tests run in controlled laboratory settings. Only through the use of mixing zones can industries and municipalities accurately assess the true impacts and address them. For many years, EPA has sup-

ported the use of mixing zones to further its holistic approach to water management.

Pretreatment

- *Federal pretreatment standards are redundant and unnecessary.* For the most part, POTWs already impose local discharge standards on industrial dischargers across the nation. These standards prevent discharge of any substance or substances that could interrupt or overwhelm the treatment system or that could pass through a cause a compliance problem with the POTW's permit. Development of federal pretreatment standards would be redundant and a waste of the EPA Office of Water's limited financial resources.
- *Instead, invest in POTW construction and operator education.* Rather than impose redundant treatment, industrial dischargers and localities would be better served with construction of POTW systems accompanied by funds to ensure the proper education and training of POTW operators. To this end, Congress should require that for every dollar loaned from the State Revolving Fund, X percent should go toward annual operator training to ensure comprehension and proper use of EPA's criteria and guidance documents—annual because of the constant issuance of new or revised EPA criteria and guidances being adopted by states.

In the textile industry's experience, particular in rural and mid-sized communities, all too many POTW operators lack the proper education to understand and apply EPA's mandates as they are adopted and implemented by states—for instance, EPA's water-quality criteria. This results in sometimes total misapplication of EPA criteria, inefficient POTW operation, costly, but unnecessary treatment, costly and protracted permit renewals for both permittees and local and state agencies, and questionable environmental benefits. I speak from experience. Nearly 70 percent of textile dischargers are indirect dischargers through POTWs in mid- and small size communities.

A case in point: One textile company in North Carolina was told by their local POTW to reduce their discharge of copper and zinc to the level of several parts per million. Yet, the city was adding copper sulfate to their system to inhibit algae growth and zinc sulfate to inhibit corrosion—both at levels that made the plant's in-coming water exceed the very water-quality limits for zinc and copper that they were imposing on the plant. The operators did not recognize the substances were being used nor did they comprehend how to properly adjust the metals limits of dischargers using their system to accommodate for their use. As a result, they were wreaking havoc and imposing overly-stringent limits on everybody including themselves.

Domestic Sewage Exclusion

- *Congress should retain the Domestic Sewage Exclusion.* It is a creation of Congress and the legislative process that has proven to be an effective and efficient manner for handling hazardous wastes. EPA and the regulated community can show that the exclusion, which allows facilities to discharge trace hazardous wastes to POTWs for treatment, has provided for the proper treatment and safe discharge of these wastes, minimal though they may be. Were it otherwise, companies could not afford, nor in many urban localities could space be found, for equivalent treatment. And, given the low detection levels that categorize a waste as hazardous, the potential for improper treatment, storage and disposal of hazardous waste would be greatly expanded.

Stormwater Permitting and Management Program

- *Allow industrial facilities that can demonstrate to EPA that they have, in EPA's terms, "no potential for stormwater contamination" to exit the stormwater permitting system and be managed under urban stormwater management plans.* This would minimize paper shuffling at both EPA and affected facilities. And, it would allow the Agency to focus on the truly "bad actors," where stormwater contamination presents real problems and allow affected facilities to focus on complying with other pressing environmental mandates.

A case in point: Many textile companies not only manufacture fabric, but also cut and sew their fabric products into apparel. These "cut-n-sew" operations use minimal, if any, chemicals and have minimal potential for stormwater contamination, but by virtue of being manufacturing operations where industrial activity takes place, are subject to the stormwater permitting requirements. If no potential for contamination exists, then common sense dictates that these facilities and others should be exempt from the permit requirements and should be

managed under larger urban stormwater management programs. Moreover, we fear that stormwater permits could become the domino triggering other requirements, just as we have seen SARA, Section 313 reports become.

- *S. 1114 grants some municipalities a waiver and others a ten-year delayed compliance schedule from the requirement that their stormwater discharges meeting numeric water-quality limits.*

Given the uncertainty about the extent and nature of the stormwater program and how to effectively manage stormwater discharges, Congress should grant the same exemption to industry and allow the success or failure of the "Best Management Plans (BMPs) and Stormwater Pollution Prevention Plans required of permitted facilities to be realized. If, numeric limits are then called for, mandate them in the next reauthorization.

Pollution Prevention

- *The marketplace already is well ahead of government at all levels at recognizing the production and cost efficiencies of adopting the pollution prevention philosophy.*

A case in point: For several years, the investment firm of Alex Brown & Sons has consistently overestimated the potential performance of stock prices for environmental control and clean-up firms. When they went looking to find the reason why they were consistently overestimating the potential value of these stocks, they realized they were looking for and found related government developments that would increase the demand for the services these firms offered, i.e., "end-of-pipe command-and-controls". What they failed to notice was that businesses and municipalities that normally would retain their services were instead taking concerted steps to avoid environmental control and clean-up costs and were adopting waste minimization and pollution prevention programs.

- *If Congress wishes to further advance pollution prevention, it should focus on providing technical assistance to companies and communities.*

The biggest hurdle to incorporating pollution prevention practices into any manufacturing operation is technical comprehension and application. The textile industry has many resources to draw upon in this area. There are numerous corporate research & development divisions within our industry, various colleges of textiles at universities throughout the Northeast and Southeast United States, and also several non-profit research institutions like the Institute for Textile Technology.

In addition, the textile industry can rely upon scientists at the U.S. Department of Energy National Labs. As a result of a recent joint agreement between the industry and the labs—the first joint agreement of its kind, which we now commonly refer to as "Amtext"—over \$15 million will be spent, in part, for research on waste minimization through technologies that facilitate reuse and recycling and, more importantly, by fundamental manufacturing process changes. Similar such funds and technical assistance should be made available nationwide to all industries and communities.

- *Moreover, if Congress wants to further advance pollution prevention, any organized program should be voluntary.*

The success of EPA's "33/50" program is a testament to the success that can be realized through voluntary programs. Numerous textile companies, including Springs Industries, Collins & Aikman, and my own employer, Milliken & Company, have not only achieved, but surpassed in many categories the mandated program goals.

Were Congress to mandate participation in a pollution prevention program with complicated annual reporting requirements and the like, it likely would divert resources from on-going programs that are generating real breakthroughs to generating more stacks and paperwork.

Fees

- *Where fees are required in S. 1114—for effluent guideline development, permits or discharges, Congress should require the input of the regulated community as to how the funds are to be used and an accounting of how the funds actually are used.*

In the case of fees assessed by POTWs, industrial and residential surcharges should be increased at approximately the same rate and be apportioned to reflect the existing use of the system.

Finally, the fees that are generated from NPDES permit holders, directly or indirectly, should be appropriated solely for point-source programs.

Risk Assessment

- *The nation's ability to detect pollutants in the parts per million, per billion and now per trillion level is overwhelming our ability to pay for the protection of human health and the environment to these same levels.*

Therefore, Congress should mandate realistic risk assessments and corresponding cost benefit analyses, and, with EPA's expertise and assistance, prioritize the risks to human health and the environment that are addressed by existing federal environmental statutes. This may be an overwhelming, if somewhat undefined task. Still, if Congress fails to act, EPA forever will be pursuing to eliminate parts per million, per billion, per trillion and so on of a substance that poses relatively minimal risk in one situation while overlooking, or more appropriately underfunding, the elimination of, perhaps, the same substance, in another situation where it poses a relatively more serious and widespread risk. This is a costly chase that few industries or communities have funding to pursue. Risk assessments accompanied by cost-benefit analyses are needed.

A case in point: Presently, the general public can drink water with more copper content than textile companies are permitted to discharge in their wastewater. Which is the greatest risk and where should the limited funds of federal, state and local governments be allocated?

Senators, as I speak, SARA, Section 313 chemical reporting forms are coming due, companies are notifying EPA of their ability to properly recycle and reclaim refrigerants under Title VI of the Clean Air Act Amendments and others are submitting Spill Prevention, Control and Countermeasure Plans under the Oil Pollution Prevention Act of 1990. Given these numerous and varied requirements, I ask you, therefore, to *recognize the context—the environment, if you will—in which efforts to comply with environmental mandates are being made.* To those of us trying to comply with federal environmental requirements, we are grappling not just with Clean Water Act mandates, but also numerous other requirements under various other federal, state and local environmental laws, all simultaneously. In today's economic environment, its easier to say, "get it done" than it is to do—particularly when the problem exists at the several parts per billion or trillion level.

Moreover, I ask that you recognize industry's efforts to date to minimize pollution and assist EPA in enhancing our environment. The success of Clean Water Act in cleaning up the nation's waterways can be, to great deal, attributed to industry's joint efforts in developing and complying with EPA's effluent guidelines and in jointly constructing—and in many cases, helping POTW managers operate—the POTWs in our communities. EPA recognizes this, we hope you do as well.

American Textile Manufacturers Institute (ATMI)

In closing let me put my statements in context and state for the record that the American Textile Manufacturers Institute is the national trade association representing nearly 75 percent of domestic textile manufacturers located in approximately 30 states. The domestic textile industry is the *largest manufacturing sector of non-durable goods in the United States and contributes more than \$53 billion to America's gross domestic product—an amount larger than that produced by the automotive, petroleum refining and primary metals sectors.* The industry consists of more than 26,000 COMPANIES representing over 2 million jobs or *12 percent of the American workforce.* Textiles are manufactured into electronic components, medical devices, auto parts, home and office furnishings, and, of course, apparel. Presently, the domestic textile industry faces an unprecedented threat from foreign imports, many from countries that have few, if any, environmental concerns or mandates.

Gentlemen, I thank you for your attention and will be happy to entertain any questions.

SIERRA CLUB

408 C Street, N.E. Washington, D.C. 20002 202-547-1141

POISON WATER, TOXIC HARBORS: RESTORING
AMERICA'S FAITH IN CLEAN WATER

STATEMENT OF BRETT D. HULSEY

SIERRA CLUB GREAT LAKES PROGRAM DIRECTOR

JULY 1, 1993

ON THE NEED FOR A COMPREHENSIVE PROGRAM TO
CLEAN UP CONTAMINATED SEDIMENTS AND
STOP TOXIC DUMPING

TO RESTORE AMERICA'S RIVERS, WATERSHEDS AND THE
GREAT LAKES

BEFORE THE SUBCOMMITTEE ON CLEAN WATER,
FISHERIES, AND WILDLIFE
SENATE ENVIRONMENT AND PUBLIC WORKS COMMITTEE

CHAired BY THE HONORABLE BOB GRAHAM

ON BEHALF OF THE SIERRA CLUB, CITIZENS FOR A
BETTER ENVIRONMENT, COAST ALLIANCE,
CONTAMINATED SEDIMENTS WORK GROUP,
GREAT LAKES UNITED,
U.S. PUBLIC INTEREST RESEARCH GROUPS,
NATURAL RESOURCES DEFENSE COUNCIL,
THE LAKE MICHIGAN FEDERATION,
AND THE LAKE SUPERIOR ALLIANCE

INTRODUCTION

I would like to thank the committee and the chairman for holding this hearing and for leading the effort to clean up the nation's waters. We thank the committee for your leadership and for taking the bold steps outlined in the Baucus-Chafee bill to deal with sediments, non-point, and toxic pollution.

My name is Brett Hulsey and I am the Sierra Club's Midwest Representative and I direct its Great Lakes Program. I am testifying on behalf of the Sierra Club, the Lake Michigan Federation, Contaminated Sediments Working Group, Citizens for a Better Environment, Great Lakes United, Natural Resources Defense Council, the Coast Alliance, the Lake Superior Alliance, and U.S. PIRG to urge you to enact a comprehensive national program to clean up the toxic sediments that line our harbors and stop additional toxic pollution from sullyng our waters.

"When we try to pick out anything by itself, we find it hitched to everything else in the universe." *John Muir*
National Headquarters: 730 Polk Street, San Francisco, California 94109 (415) 776-2211

This is of top importance to all Americans and especially the millions who belong to these organizations. The Sierra Club's 100,000 members in the Great Lakes region and 600,000 members in U.S. and Canada have made restoring the country's waters and the Great Lakes -- that is making them safe for mothers to drink, and wildlife and fish safe to eat -- a national campaign. The groups endorsing this testimony represent more than 2 million Americans who are dedicated to cleaning our waters and hundreds of local groups that rely on clean water for their jobs and livelihood.

The need for this is clear to those of us living in Wisconsin and witnessing the human tragedy in Milwaukee: This spring more than 200,000 became sick from a water-borne infection spread in the public drinking water. 800,000 people were not able to safely drink the public water. At least six elderly and AIDS patients have died or are critically ill from the contaminated water. Schools and businesses were forced to close and the costs could run in the billions. The public in Wisconsin and much of the country has lost faith in the safety of our water delivery system and we are looking to Congress to restore the nation's waters.

We must address water safety issues in the upcoming Clean Water Act reauthorization to insure that America's waters are safe for drinking, swimming, and fishing.

SUMMARY

The above groups representing more than 200 environment, labor and sports groups, have a comprehensive plan to address contaminated sediments.

1. EPA needs statutory authority to develop a strong national program with deadlines and funding to measure and clean up toxic sediments with strong and practical sediment quality criteria (SQC) so that communities can identify and cleanup toxic sediments in their area. Federal criteria exist for every other major form of pollution. SQC are needed to identify the extent of sediment contamination, to help protect clean areas and promote pollution prevention, to identify critical areas for cleanup, and to determine appropriate methods to manage dredge materials.
2. EPA must develop policies to apply SQC to the states and other programs. States need EPA guidance to apply the SQC to various programs like the NPDES, non-point, ocean and estuarine dumping criteria, and Superfund.
3. EPA should administer a national sediment program to use technologies developed by EPA's Great Lakes (ARCS) program and the Superfund SITES programs to cleanup toxic sites in the Great Lakes and marine sites. This program also needs to test new technologies in critical marine sites in addition to New York/New Jersey harbors which were authorized under section 405 of WRDA of 1992. EPA has bench tested at least five technologies in the Great Lakes but full-scale tests are needed to determine costs and effectiveness before recommendations can be made for full cleanups.
4. Make pollution prevention measures a condition to receive a permit to dispose of contaminated sediments and include pollution and sediment prevention measures in other Clean Water Act programs to reduce further sediment contamination.

5. The EPA/Corps ocean disposal program should be improved since the ocean dumping criteria (as mandated by section 103 of the MPRSA) lack appropriate thresholds to interpret bioaccumulation test results. This program is being run by the EPA regional office and Corps districts and lacks adequate public review and central management. Clarification of roles are needed.
6. Develop a phase-out period for open water dumping of contaminated sediments in sensitive areas like Lake Superior as called for by the International Joint Commission.
7. Strengthen and enact the Metzenbaum/Glenn Omnibus Great Lakes Clean Water Amendments to improve sediment management and cleanup in the Great Lakes. We would like to see more sites included for testing of technologies.
8. Create a funding mechanism to pay for sediment management and clean-up under section 115 of the WPCA or another appropriate section.

S. 1114, MAKING GOOD PROGRESS

The Committee bill, S. 1114, takes several important steps in this direction. We applaud the committee's foresight to give EPA clear authority to release sediment quality criteria (SQC) and set deadlines for 8 chemicals, including PCBs and Dioxin within five years. The PCB and Dioxin standard are particularly important given the current controversies in New York/ New Jersey and Duluth/Superior harbors. But since EPA has five draft criteria pending for release this summer, we feel that they can include up to eight additional chemicals in that five year period once their protocol for doing SQC is established.

We urge the committee to consider our points above in revising the legislation.

TOXIC HARBORS, A NATIONAL PROBLEM

Contaminated sediments -- the toxic muck that settles to the bottom of our rivers, lakes, and harbors -- is a huge national problem. EPA has concluded that it is likely that every major water body in the U.S. has moderate to severe sediments contamination. This issue is also an economic one, since the contamination often makes it difficult or impossible to dredge harbors and maintain shipping as we are seeing in ports like New York/ New Jersey.

The 60 million tons of dredge material that are ocean dumped from these harbors and rivers each year pose a significant challenge to environmentalists and port operators. For an idea of the extent of sediment contamination on the marine coasts, please see the appendix. Table 6-5 shows a list of these sites. Note that Ohio leads the nation with 193 sites clogged with toxics like arsenic, cadmium, and lead. Florida experiences these problems in the Miami River and harbor area also.

Contaminated sediments account for 75% of the PCBs going into Lake Michigan, according to a recent National Wildlife Federation study. They are

also the main source of fish contamination. According to the EPA National Water Quality Inventory, 1988 Report to Congress:

"The main reason for these fishing restrictions is contamination of sediments by toxic chemicals such as priority organics that are, in turn, passed along to macroinvertebrates and fish." (page 35)

In the 1990 Report to Congress, EPA said: "...landfills and contaminated sediments are the leading sources impairing the Great Lakes." (page 39)

There is no clearer example of the national need for this program than in the Great Lakes. Toxic muck clogs all but one of our areas of concern and stifles economic development in many. The Port of Toledo may be forced to close if the U.S. Army Corps of Engineers does not cooperate with the Ohio and U.S. EPA to end the dumping of contaminated dredge spoil in Lake Erie near Toledo and Oregon, Ohio water intakes. The Corps insists that this sediment is not polluted, but the Port of Toledo and all the environmental agencies feel that it is.

I will use the Great Lakes example to illustrate this need because one in ten Americans drink the water and because these are good examples of problems seen everywhere. The appendix has a partial listing of contaminated sites from New Bedford to Chesapeake Bay, to the Gulf Coast, California to Puget Sound, sediments are clogging our harbor, poisoning our fish, and putting maritime jobs at risk.

JOBS AT RISK

The Sierra Club recently released its Clean Lakes, Clean Jobs study that documents the jobs and money at risk if we fail to cleanup the toxic blobs that rest at the bottom of every Great Lakes harbor. Billions of dollars and thousands of jobs are at risk if toxics are not cleaned up (see table).

GREAT LAKES JOBS AT RISK

	JOBS	COSTS
HEALTH	*	\$18.47 Billion
FISHING	89,000	4.0 Billion
SHIPPING	44,000	3.5 Billion
TOURISM	2,760,000**	69.0 Billion
TOTAL	2,893,000	\$94.97 Billion

[* complete data unavailable; ** assumes \$25,000/direct job]

Great Lakes tourism is the most threatened industry. Tourism is a \$69 billion industry in the Great Lakes Basin and the number two industry in several states. In Ohio, Lake Erie recreation industry accounts for \$8.5 billion and 152,000 jobs.

Approximately 89,000 fishing jobs and more than \$4 billion in

commercial and sport fishing proceeds are in jeopardy. There are more restrictions on fish consumption in the Great Lakes than anywhere in the United States, 1,000 of the nation's 1,400 fishing restrictions -- five in seven -- come from Great Lakes states. As the EPA said, these are largely a result of sediment contamination.

Also at risk are more than 44,000 shipping jobs and \$3.5 billion in personal and corporate income, including state and local taxes paid by the ports. Contamination and lack of a national program to deal with this toxic muck prevent safe dredging in half of all Great Lakes harbors where sediments cannot safely be dredged.

Because communities cannot safely dredge this toxic sediment, barges must lightload their cargos an average of 480,000 pounds. This means lost profits and jobs in the millions for the entire Great Lakes Basin.

If you extrapolate these risks to the country at large and three other coasts, the potential job risk could be near 10 million and the commerce at risk could be near \$400 billion. That justifies an aggressive national program to identify and clean these sites. While the price tag for cleaning up all Great Lakes seems expensive -- \$10 billion by some estimates -- the potential of creating 400,000 jobs in depressed areas of the Great Lakes is enormous.

STOP NEW POLLUTION

As other speakers have pointed out, we must also stop new contamination from existing point and non-point sources. Appendix table I-2 shows the persistent toxic levels of PCBs in coho salmon in all the Great Lakes. These levels are over 70 times EPA's 1/100,000 cancer risk level and may cause over 38 thousand cancers cases each year according to EPA estimates. This shows that toxic levels remain high in the Great Lakes despite years of point source controls.

According to the EPA National Water Quality Inventory, 1990 Report to Congress, 67.7% or two-thirds of Great Lakes shoreline does not support Clean Water Act designated uses. Only 85 miles -- less than 1 in 50 -- fully support Clean Water Act designated uses for fishing and swimming. None of the shoreline in Wisconsin, Illinois, Indiana, Michigan, and Ohio supports full Clean Water Act designations.

The current clean water law allows toxic chemical discharge into the nation's waters and the Great Lakes ecosystem which cause these impairments. These laws -- especially the Clean Water Act -- allow polluters to dilute and mix toxics in the air and water. The only way to make the Great Lakes safe for drinking, fishing, and swimming is to phase out the release of these toxic substances into the U.S. water and the Great Lakes to achieve Zero Discharge. We encourage the committee to take tougher measures to eliminate mixing zones than are in the Baucus-Chafee bill.

Current law allows states to dump vastly different quantities of toxic material into their waterways.

To put this in perspective, the Exxon Valdez illegally dumped 11 million gallons of oil into Alaska waters and was fined about \$1 billion. Each year, U.S. industries dump two-thirds that amount into the Great Lakes water supply for 25 million Americans.

Uncontrolled toxic dumping is a national problem also. Conservative estimates taken from the 1990 Toxic Release Inventory (TRI) data (which do not cover all industrial sources) showed that industry dumped nearly 200 million pounds of toxic and hazardous material into U.S. waterways. In addition, manufacturing industries dumped 448 million pounds of toxic materials in 1990, and washed another 254 million pounds down the drain.

Scientific evidence shows that widespread, low-level exposure to some persistent toxic chemicals like PCBs, Dioxin, and mercury will:

- threaten newborn children with premature birth, low birth weights, and impaired learning loss of up to 5 IQ points;

- cause 38,255 cancers to fishers and non-fishers in the Great Lakes basin, according to EPA Risk Analysis of 26 Environmental Problems, Draft Working Documents, page 4;

- cause birth defects, sterility, and population decline in fish and wildlife like bald eagles, lake trout, cormorants, and mink;

- make lake trout, salmon, and other species unsafe to eat in all the Great Lakes because they can cause health problems and increase cancer risks; and

- remain in the lake ecosystem, concentrating in and damaging humans and wildlife for decades.

Current U.S. and state environmental laws allow polluters to dump toxic chemicals into aquatic ecosystems which poison the food web. According to a recent International Joint Commission study, Great Lakes states now use a hodgepodge of regulations that allow dumping of persistent poisons. For example, a plant that could only dump 4 pounds of mercury into Wisconsin waters would be allowed to dump 55 pounds in Ohio, 99 pounds of mercury in Illinois, and 323 pounds in New York.

(IN POUNDS)			

The Control of Discharge of Toxic Pollutants into the Great Lakes and their Tributaries: Development of Benchmarks, Jeffrey A. Foran, PhD., International Joint Commission, page 39.

Clearly, this jeopardizes more than the water quality, fish eaters, and wildlife. It puts industries of the clean states at an unfair competitive disadvantage. States compete for industry by jeopardizing their water supply rather than strengthening their workforce. We are promoting uniform, water

quality standards that protect jobs, people, fish, and wildlife.

This is indicated by the ubiquitous fish advisories throughout the country. As you can see from Figure 6-1 in the appendix, the Great Lakes states have the greatest number of fish advisories in the nation.

We urge the committee to study the approach taken in EPA's new Great Lakes Water Quality Guidance to create a level playing field. This Guidance is called for in Section 118 of the 1987 amendments to the Water Pollution Control Act and the 1990 Great Lakes Critical Programs Act. The document recently released by EPA would require states, in their next triennial review, to:

--Establish minimum water quality standards to protect human, wildlife, and fish health;

--Target the worst pollutants -- those that bioaccumulate the most like PCBs and Dioxin -- in people, fish, and wildlife;

--Prohibit the use of mixing zones for these chemicals of concern;

--Include provisions to keep clean waters, like Lake Superior, clean by making Lake Superior an Outstanding Natural Resource Water. This would create one place where Zero Discharge of persistent toxics could be demonstrated as called for in the original Water Pollution Control Act, the Great Lakes Water Quality Agreement and recommended by the International Joint Commission; and

--Protect inland rivers and lakes, in addition to the Great Lakes, if the state chose.

CURRENT EPA EFFORTS

To help solve this problem, EPA plans to release draft criteria for five sediment contaminants this summer, but clearly the progress is too slow. With current staff and funding, the EPA will not have sediment criteria for all the IJC Critical Pollutants List until the middle of the next century. The public will not accept this slow response to our worst contamination problem.

We have several successful programs to address Great Lakes sediment pollution, like the Assessment and Remediation of Contaminated Sediments (ARCS) Program, set up under Section 118 of the 1987 Clean Water Act Amendments and the Great Lakes Critical Programs Act. These provide key demonstration programs and deadlines to test technologies and complete the Remedial Action Plans (RAPs).

As a member of the ARCS Citizen Work Group, I can report some progress on this program -- five pilot treatments were tested last summer with some promising results. In the laboratory, over 10 technologies were tested. ARCS also did five in-depth contaminant assessments from Buffalo, Ashtabula, Saginaw, Indiana Harbor, and Sheyboygan harbors. But these plans and tests are only that. We need a concrete program to clean up these 27 toxic Great Lakes hotspots and many others in ports around the country.

The Clean Water Act reauthorization presents a perfect opportunity to make additional progress in the Lakes and make the fish safe to eat. Over the past three years, Great Lakes and coastal advocates have worked with the ports, EPA, and Army Corps of Engineers to draw up a national program to deal with these underwater toxic sites.

CONCLUSION

In conclusion, this year's Clean Water Act reauthorization gives us the opportunity to stop additional persistent toxics from entering the waters of the United States and to clean up the current toxic hotspots. We urge this committee to be bold and meet the challenge to make this happen.

We are especially concerned that you:

- Protect women and children from toxic chemicals that accumulate in fish and cause birth defects;
- Restore the toxic harbors of the nation and protect the jobs at risk;
- Protect people who eat the most Great Lakes fish, like sport anglers, Native Americans, and others who fish for their food;
- Protect fish and wildlife from all chemicals that cause birth defects and deformities; and
- Keep high-quality waters like Lake Superior clean.

Thank you.

MAJOR PROVISIONS OF THE "GREAT LAKES CLEAN WATER AMENDMENTS
OF 1993"

1. SEDIMENT MANAGEMENT - PROVIDES EPA WITH CONCURRENCE AUTHORITY OVER SEDIMENT DREDGING AND DISPOSAL PRACTICES IN THE GREAT LAKES. IT WILL ALSO REQUIRE MANAGEMENT PLANS FOR THE REGION'S CONFINED DISPOSAL FACILITIES INCLUDING PLANS FOR REMEDIATION AND POST-CLOSURE CARE.
2. SEDIMENT REDUCTION - REQUIRES THE CORPS OF ENGINEERS TO MEASURE SEDIMENT LOADINGS INTO THE MAJOR RIVER SYSTEMS FEEDING GREAT LAKES HARBORS AND TOXIC HOT SPOTS. IN ADDITION, PROVIDES STATES GRANT MONEY TO EXPLORE AND DEMONSTRATE BEST MANAGEMENT PRACTICES TO REDUCE EROSION THAT RESULTS IN SEDIMENTATION OF HARBORS, CHANNEL MAINTENANCE PROJECT SITES AND TOXIC HOT SPOTS AROUND THE LAKES.
3. SEDIMENT CLEANUP - REAUTHORIZES THE CLEAN WATER ACT'S EXPIRED ASSESSMENT AND REMEDIATION OF CONTAMINATED SEDIMENTS PROGRAM (ARCS) WHICH PROVIDED FOR PILOT SCALE TESTING OF SEDIMENT CLEANUP TECHNOLOGIES. THIS PROVISION WILL REQUIRE FIVE FULL SCALE TECHNOLOGY DEMONSTRATIONS, AND REQUIRE ASSESSMENTS OF SEDIMENT CONTAMINATION AT ALL OTHER TOXIC HOT SPOTS IDENTIFIED IN THE GREAT LAKES.
4. POLLUTION PREVENTION - PROVIDES INCENTIVES TO INDUSTRY (WAIVER OF EFFLUENT GUIDELINE FEE AND ONE YEAR COMPLIANCE DELAY FOR NEW EFFLUENT STANDARDS) FOR INSTALLING POLLUTION PREVENTION TECHNOLOGIES. ALSO PROVIDES TECHNICAL ASSISTANCE TO MUNICIPALITIES IN THE GREAT LAKES BASIN TO HELP THEM REDUCE TOXIC POLLUTANTS IN URBAN RUNOFF.
5. ENVIRONMENTAL RESEARCH - ESTABLISHES A GREAT LAKES RESEARCH COUNCIL TO INCLUDE EPA, THE FISH AND WILDLIFE SERVICE, NOAA, THE COAST GUARD, THE INTERNATIONAL JOINT COMMISSION AND EACH GREAT LAKES STATE TO HELP COORDINATE ON-GOING RESEARCH ACTIVITIES IN THE REGION.
6. LAKEWIDE MANAGEMENT PLANS - SETS DEADLINES FOR EPA ACTION ON DEVELOPING FIVE LAKEWIDE PLANS SETTING OUT LONG-TERM, COMPREHENSIVE STRATEGIES FOR RESTORING, PROTECTING AND MAINTAINING HIGH QUALITY WATERS.
7. ENFORCEMENT - PENALTIES FROM GREAT LAKES SPECIFIC CLEAN WATER VIOLATIONS WILL BE DEPOSITED IN A REVOLVING FUND AND MONIES FROM THE FUND WILL, TO THE EXTENT PRACTICABLE, BE USED TO SUPPLEMENT AND SUPPORT PLANS, PROGRAMS AND PROJECTS TO BENEFIT THE WATER QUALITY OF THE GREAT LAKES.

STATEMENT BY FRANK H. HACKMANN,¹ U.S. CHAMBER OF COMMERCE

The U.S. Chamber of Commerce appreciates this opportunity to offer its perspective on S. 1114, the proposed reauthorization of the Clean Water Act of 1987 (Act).

There has been great progress in cleaning the streams and rivers of the country over the last twenty years. Because of this progress, the Chamber believes that major revisions to the Act are not needed. This testimony will, however, encourage marginal, needed changes in keeping with the history of federal legislation and enforcement in this area.

An appropriate historical perspective is invaluable when addressing issues as fundamental to the environmental, social, and economic future of America as those addressed in the Act. The extension of federal regulation to maintaining clean water is generally considered to have begun with the nearly unanimous passage of the Federal Water Pollution Control Act of 1972, although the roots reach back to the 1899 Refuse Act.

The 1972 Act set forth some basic principles which remain the guiding lights today.

- Any discharge to the waters of the United States is unlawful unless expressly permitted (or otherwise exempted).
- Permits issued to dischargers shall state with detail the permissible discharge components and concentrations, with violators being subject to both civil and criminal prosecution, as well as citizen suits.
- All discharges are generally required to use a specified level of control technology, whether or not that technology is necessary to meet receiving water quality.
- Dischargers can also be made to provide tighter levels of treatment in order to meet applicable receiving water quality standards.
- There is a major federal funding rule to assist municipalities in discharging their obligations under the law, although the lack of federal funds is itself not a defense to noncompliance.
- Specified areas of concern, such as nonpoint source pollution and area-wide watershed issues, are dealt with in a somewhat different fashion—but are addressed in a manner that was acceptable to Congress.
- Different standards are needed for the so-called conventional pollutants and the so-called toxic pollutants, with appropriate standards for each.
- Water pollution control laws need to be coordinated with the remainder of the federal regulatory scheme on issues such as on-land sludge disposal, sludge incineration, etc.

In general, over the years the Chamber has supported these basic concepts, although it has disagreed, sometimes strongly, with specific items or amendments. Often this disagreement was over the means to reach the goals, rather than the goals themselves.

These principles are especially relevant to issues impacting small businesses and their compliance efforts, and should be used as a guide in developing further changes to the Clean Water Act. As much as possible, regulatory guidance should be clear and comprehensible, so that the regulated community understands what is expected, why it is expected, and how it can be done in the real-world context of a business operation.

Overall, the Chamber believes the Clean Water Act has worked reasonably well, especially as compared to some other programs. While the Act is far from perfect, it does seem to be fairly well understood and well accepted in the business community. Because of improved measurements, such as the ability to detect parts-per-billion of contaminants in water, there is a misconception that water quality is deteriorating. More than 75 percent of the nation's lakes, rivers and streams meet strict water quality standards based on their intended use. As Congress begins the reauthorization process, it should not overlook the considerable improvements in water quality achieved under existing law. Many of the new water quality requirements under the 1987 amendments have just begun to take effect, while others are still being implemented.

SELECTED SPECIFIC ISSUES WITHIN S. 1114, REAUTHORIZATION OF THE CLEAN WATER ACT

The major concerns business and industry have about the Act reflect issues such as effluent guidelines, pretreatment requirements, further implementation of water

¹ Partner, Sonnenschein, Nath and Rosenthal, and former Chairman, U.S. Chamber of Commerce Water Quality Subcommittee.

quality standards, and the apparent use in evaluating risks of placing one conservative assumption upon another resulting in significant overstatements of risks.

As noted, the Act clearly has made our waterways cleaner and our environment better. However, disruption or drastic changes in the basic framework of the statute would only cause further delays in the progress being made.

Toxic Control

To control the discharge of toxic substances, S. 1114 would simply ban their discharge. This concept is not wise public policy. While a "no discharge standard" may have superficial political appeal, it is often technologically or economically impractical or even unworkable, and even if complied with may not provide a net overall benefit. A more appropriate and realistic public policy will acknowledge the efficacy of treatment technologies and the relative effects of various contaminants when discharged into different media, and seek to minimum any negative environmental effects. This must be done without losing sight of other national goals, including economic factors.

Bans or restrictions on the use or production of materials without a determination of unreasonable risk to health and environment, consideration of the magnitude of exposure, societal benefits and economic consequences, are contrary to the Pollution Prevention Act of 1990. The Industry innovations, voluntary efforts and market-based incentives are more effective ways to attain environmental protection and making progress in finding optimal solutions for reducing discharges to our nation's waters.

Pollution Prevention

While the Chamber strongly endorses the overall concept of pollution prevention and waste minimization as integral parts of industrial operations, it is opposed to specific statutory mandates proposed by S. 1114. The reason is that our past experience with a variety of environmental laws has shown the difficulty of translating specific numerical statutory goals into reality at the level of an operating plant. Clearly the statutes should encourage the EPA and industry to move forward in efforts to make sensible, further reductions in pollution. However, the costs, both economic and social, associated with such decisions cannot and should not be ignored by Congress. Industry innovation, voluntary efforts and market-based incentives are more effective ways to attain environmental improvements and protection than is legislative prescription.

Pretreatment

The Chamber is concerned about the pretreatment provisions of S. 1114 because the vast majority of our members send their effluent to POTWs. Adequate mechanisms already exist to provide control over hazardous materials and toxics from industrial sources and a new round of pretreatment requirements will only result in regulatory overkill. Additional pretreatment controls and restrictions on the domestic sewage exemption, will have three major adverse consequences with no corresponding environmental benefit:

- proliferation of small on-site "pretreatment" plants, each of which would be added to the NPDES permit system, at least in some fashion;
- a corresponding increase in the universe of hazardous waste generators, because any on-site treatment residuals or users affected by loss of the "Domestic Sewage Exemption" who would therefore become subject to the RCRA system; and
- dilution of enforcement effort by converting centralized treatment plants which can be assessed and monitored relatively efficiently, into a larger and much harder-to-track universe of regulated sources.

Removal Credits

The Chamber supports the continued use of removal credits for chemicals with categorical pretreatment standards consistent with the current legal framework regulating a municipality's use and operation of its sewage system. We recognize there is a significant potential problem related to sewage sludge disposal; there is an interrelationship between sewage sludge disposal regulations and removal credits regarding toxic material levels. However, it is not necessarily more advantageous to force users away from heavy reliance on large, central publicly owned treatment works for their treatment needs. Increasing the number of small pretreatment facilities, particularly at smaller industries, in an effort to meet unreasonably stringent sewage sludge disposal regulations may not represent the best overall environmental outcome. For example, multiplying the number of regulatory sources of con-

cerns could strain the enforcement mechanism. Thus, while we understand the tension between the removal credit and sewage sludge disposal issues, we caution against setting sewage sludge standard so stringent that many types of common and historically acceptable industrial dischargers would face difficulty with continued sewer use while providing a traditional level of pretreatment.

Compliance Should Be Made Easier, Not Harder

One major concern of the Chamber is that many portions of the EPA programs, laws and regulations are nearly incomprehensible to the practicing professionals, and even more so to the small businessman or small manufacturer where the bulk of America's jobs, and job growth, reside. In addition, regulations under the different statutory authorities are not coordinated, creating conflict and duplication. A number of the so-called toxic and nonconventional pollutants are ubiquitous materials found nearly everywhere in our society. Therefore, further regulations of these materials will vastly increase the number of regulated indirect users, diffuse the enforcement ease with which significant problems can be identified and handled, and create the potential for less, not more, environmental protection.

Sound Science

The Chamber supports the use of credible science and economic considerations in setting, revising, and implementing discharge permits and related standards.

Occasionally, the EPA will determine that a different technology standard or permit limits should apply when a permit is renewed. If what otherwise appears to be a "weaker" standard is nonetheless based on sound science and applicable regulations, sound public policy is not served by refusing to acknowledge the new facts, situations, standards, and regulations.

A National Pollutant Discharge Elimination System (NPDES) permit should be able to be modified upward, just as it can now be modified downward. There is no reason to be forever shackled to past understanding, errors, or good-Faith misjudgments in issuing and reviewing permits.

Summary

Government should not make it unnecessarily difficult for the regulated community to do what is desired. The Chamber believes that the basic structure of the Clean Water Act is working well, and that no radical changes are necessary or appropriate. Progress has been made in cleaning up and managing our water resources, and we do not dispute that more needs to be done to solve the remaining problems. To meet these challenges in a cost-effective and equitable way, Congress should consider the following criteria as part of the reauthorization effort:

- sound science and economic considerations as the basis for discharge limits and cleanup priorities;
- equitable and flexible regulations, where needed, for all sources;
- recognition, within state and local water-quality standard determinations, of the need for economic growth; and
- limitation of permit-application costs, monitoring requirements, and paperwork burdens.

The Chamber looks forward to working with committee staff as Congress deliberates the reauthorization of the Clean Water Act. A consistent approach, with a view toward pursuing a broad public policy designed to further a variety of national goals, both environmental and economic, will greatly contribute to the nation's ability to compete effectively in the domestic and international marketplace while making continued improvements in our water resources.

WRITTEN TESTIMONY OF DR. MORGAN REES, DEPUTY ASSISTANT SECRETARY (PLANNING POLICY AND LEGISLATION)

INTRODUCTION

Due to the short notice of the request to present testimony at the July 1, 1993 hearing on toxic pollutants held as one in a series on the reauthorization of the Clean Water Act, the Subcommittee agreed that Army could present written testimony subsequent to the hearing. This statement presents Army positions on Title II of S. 1114 concerning the issue of contaminated sediments, which is the topic Army was requested to address at the hearing. Thank you for the opportunity to present this written statement for the record.

There are several policy and management concepts embodied in Title II of S. 1114 which Army fully supports. They are cross media management of pollutants, management and regulation of pollutants based on validated science and technology, prioritization of actions based on relative risk assessment, and pollution prevention. My testimony will address each of these in turn.

CROSS MEDIA ANALYSIS

The Army civil works program is operated by the Army Corps of Engineers (Corps). The program involves responsibility for dredging and disposal of dredged material from Federal navigation channels and harbors which is crucial to the economic health of interstate and international commerce. Dredged material occasionally contains contaminants. We have found throughout our years of attempting to manage this program, that sometimes these contaminants are a result of marine operations such as fuel leaks, overboard discharges, or hull cleanings. But far more often, the contaminants originate upland and are unrelated to commercial navigation activities. Nevertheless, when it comes time to dredge and dispose of the material, the Corps and port and shipping interests are faced with the very difficult task of solving the pollution problem caused by others.

Potential solutions to the problem are made all the more difficult by fragmentation and sub-optimization of existing regulatory schemes. For example, in following the requirements of the National Environmental Policy Act (NEPA), the Corps evaluates all reasonable alternatives. Upon completion of that analysis, a disposal method is selected and approval sought from the regulatory agency responsible for that particular medium. Separate agencies and separate programs exist for land, air, and water disposal options. We frequently find that one agency will say, "not in our medium, go look somewhere else." The next agency will say the same, and the one after that will have the same response. The bottom line is that no disposal option is acceptable, yet the alternative of closing down the major ports and harbors by not dredging is equally unacceptable. One way to break out of this circle is to require regulatory agencies to look at all media on an equal footing, as required by NEPA, and to require the regulatory agencies to organize themselves along lines which allow and promote this cross media analysis philosophy.

Two points addressed in S. 1114 which also bear on this concept are that measures must be economically achievable and criteria for one medium must reflect criteria for other media. For example, we have situations where discharges from upland dredged material containment facilities into water were allowed and dredging the same material from that water body and placing it elsewhere in the water was disallowed. This makes no sense scientifically and is singularly inequitable to the party who has to do the dredging.

Over the past several years the Corps and the Environmental Protection Agency (EPA) have been developing a technical framework for determining the environmental acceptability of dredged material disposal alternatives. That framework was published jointly by the Corps and EPA in November of 1992 as a technical framework manual entitled "Evaluating Environmental Effects of Dredged Material Management Alternatives." That manual addresses full consideration of all practicable alternatives on an equal basis for both clean and contaminated sediments and fully incorporates the cross media concept. Any legislation which directs how contaminated sediments are to be managed must be consistent with the cross media approach.

SCIENTIFIC BASIS

The proposed statute should build on a risk based approach to environmental management to include effects based testing and cross media assessment. It should include the notion that we do not know everything about everything and we must operate within the science and technology we have today. Two regulatory techniques of Title II of S. 1114 bear directly on this point: sediment quality criteria and mixing zone limitations. Both techniques seem to be based on an assumption that the water would be off limits for certain material and the material would have to be disposed of elsewhere. In one sense, this runs counter to the cross media analytic approach discussed earlier. More significantly, the Corps believes either technique has a limited scientific basis in the context of this bill. We believe strongly that any management or regulatory techniques must have valid scientific bases for adoption. Listed below are discussions on sediment quality criteria and mixing zones. In addition there are discussions on the Corps dredged material research and development and beneficial uses programs.

Sediment quality criteria. Recently, there has been some interest in developing chemical-specific numeric sediment quality criteria for sediments. These numeric criteria would serve a number of purposes. Potentially they could be used to direct

how dredged material would be tested and managed and would possibly serve as state standards. Adopting numerical criteria would appear to simplify the testing and decision making process and afford an acceptable level of environmental protection. Unfortunately, the chemical-specific approach to sediment quality criteria should not be the only tool in evaluating contaminated sediments that the Corps would dredge or regulate. The sediments the Corps deals with and the ecological evaluation of the disposal alternatives are far too complex to rely totally on this approach. Because of the environmental situations we face in the disposal of dredged material (e.g. confined and nonconfined land disposal, wetlands placement, and dispersed aquatic placement), the Corps believes that it is beyond current technical capability to develop chemical specific numeric sediment quality criteria which accurately and consistently predict the effects of contaminated sediments. Simply, knowing the concentration of a chemical in a contaminated sediment does not measure its mobility, toxicity, and bioavailability in a complex sediment matrix. Furthermore, it will not allow prediction of its effects on human health and the environment under the range of conditions found in navigation channels and disposal alternatives. The presence of other contaminants, the particular sediment matrix, and the various environmental receptors all interact to affect the pollutant's bioavailability and impact. Many of these interactions cannot be quantified by a simple chemical-specific numeric approach. Consequently, the Corps and EPA developed an effects-based testing approach for the national dredging program, using a broad array of tests and a preponderance of evidence to reach management decisions. This is a demonstrated and scientifically defensible approach that can effectively be applied in regulatory and Federal project decision-making. This effects based approach was initiated in 1974 and has evolved and improved over two decades through implementation in the Marine Protection, Research, and Sanctuaries Acts and Clean Water Act programs. This effects based testing protocol has been subjected to numerous refinements over the years. The current effects based testing program is advancing the state-of-the-science with research into chronic/sublethal and genotoxic effects of contaminated sediments and continues to progress as our analytical procedures are refined and detection limits are lowered.

Development of a new proposed sediment quality criteria testing and regulatory protocol must continue to be subjected to appropriate peer review, scrutiny and scientific validation as was effects based testing. We must also clearly articulate what role sediment quality criteria will have in the overall regulatory scheme. Will sediment quality criteria become pass/fail standards, as some have advocated, or will they replace the existing effects based testing program that has been developed jointly by the Corps and the EPA over the past twenty years? The Corps and the EPA agree that sediment criteria should not be thus used. On numerous occasions the Corps has stated its support for development of sediment quality criteria if those criteria would be used as a screen for effects based testing. Because dredged material is a complex substance with many potential contaminants, the few criteria currently proposed (8) would still require the effects-based toxicity testing approach.

In a November 5, 1992, review of sediment quality criteria by the EPA's Science Advisory Board, a number of recommendations were made. The Corps supports those recommendations, including the need for research into uncertainties associated with the equilibrium partitioning based predictions, verification of field effects and the recommendation that the criteria not be used as stand alone pass/fail values for all applications. The Corps also supports the Board's recommendation that EPA prepare a users manual for derivation and application of sediment quality criteria.

Our technical expertise in evaluating and managing sediments from navigation channels, including highly contaminated sediments, parallels development of much of the environmental legislation of the 1970's to the present. We believe that the Corps can provide valuable experience and expertise in the evaluation and implementation of sediment quality criteria. We seek formal recognition of a Corps role in the development and implementation of sediment quality criteria, much as we have had in the development of the currently used effects-based approach. I might add that the Corps and EPA currently share technical guidance development and implementation responsibilities under the Clean Water and Marine Protection, Research, and Sanctuaries Acts.

Mixing zones. Research and field monitoring have shown that aquatic disposal sites have a significant assimilative capacity for dredged material discharges. Since dredged material is predominately natural sedimentary soil material that presently exists in any water body, aquatic alternatives are not only an environmentally safe form of disposal, but preferred alternatives in many cases. An important management tool at aquatic disposal sites is the use of a mixing zone that will allow for

some minor impact within the zone and no impact outside the zone within a given water body. The mixing zone is designed and located to protect sensitive aquatic areas and recognizes that there are locations within a water body that can assimilate the discharge with minimal short term and no long term impact. The use of a mixing zone emphasizes water column protection; where proper disposal site selection places major emphasis on bottom impacts but includes the water column. Consequently, use of an appropriate mixing zone and proper site selection must be retained as a regulatory tool that will result in minimal impact to aquatic resources and an acceptable disposal decision.

Research and development. Over the past twenty years, research has played a vital role in the identification of environmentally appropriate dredged material disposal alternatives. Research has involved all facets of sediment management from beneficial uses such as wetlands establishment, design of contained disposal facilities to toxicology of contaminated sediments. The Corps Congressionally mandated research provides the scientific basis of our work with the EPA to classify sediments according to contamination potential and to regulate dredged material in a cost-effective and environmentally responsible manner. Research is playing an important role in determining the effects of low doses of contaminants from dredged material disposal on organisms over a long period of time. Research is also helping us to reduce the cost of evaluating dredged material contaminant characteristics by identifying less expensive yet equally sensitive tests. Our research on the use of biomarkers to determine the presence of dioxin in sediments could reduce the cost of the analysis from over \$2,000 per sample to less than \$200. Research has also played important roles in determining potential contaminant pathways, bioaccumulation potential, leachate pathways from upland disposal areas, and potential impacts to endangered species, to name just a few examples. The ultimate objective of our research is to provide sound scientific information to help decision makers make more informed and scientifically based decisions.

Beneficial uses of dredged material. Army has informally employed the concept of beneficial uses of dredged material within its dredging program for many years, and as formal policy since at least 1968. A recent Office of Technology Assessment study reported that about 95 percent of the sediments dredged from coastal waters each year (about 150 million cubic yards) are considered suitable under Federal environmental criteria for a wide range of beneficial disposal options.

Army authority for beneficial uses of dredged material was originally limited to projects incidental to maintenance or construction and where there was no increase in cost to the Federal project or where the local sponsor would pay the incremental increased cost. The Corps received further authority for beneficial uses of dredged material for placement of material on beaches under Section 145 of the Water Resources Development Act of 1976, as amended. This authority, justified primarily as hurricane and storm damage reduction, requires 50-50 cost-sharing of incremental costs, and that the beach be public. Section 1135 of the Water Resources Development Act of 1986 provides further authority for dredged material beneficial uses. Finally, based on an initiative from Army, Section 204 was included in the Water Resources Development Act of 1992. It allows the Army to participate in projects to use dredged material for aquatic habitat and wetland creation, restoration, and protection. The initial project cost must be shared 75% Federal and 25% non-Federal. Any operation, maintenance, replacement and rehabilitation costs are 100% non-Federal. The authority is applicable to the construction, operation, or maintenance of an authorized Federal navigation project. There is a \$15 million annual appropriation limit on the authority, and the President's budget includes \$3 million for the program in Fiscal Year 1994. The Army and EPA have been working with interested states and others to address some of the issues associated with beneficial uses of dredged material.

Traditional beneficial uses would include habitat development (wetland and upland); beach nourishment; strip mine reclamation and solid waste landfill cover; shoreline stabilization and erosion control; and construction aggregate and industrial use. More recent efforts have expanded the beneficial use concept to include capping of contaminated material outside the navigation channel with clean material dredged in a nearby Federal or permitted project.

Presently, research activities concerned with the beneficial use concept are examining the possibility of using at least marginally contaminated dredged material for wetlands habitat development. This effort is being carried out in the Times Beach confined disposal facility at Buffalo, NY and at the Corps/EPA field verification site at Bridgeport, CT. Both sites are currently being evaluated to document migration of contaminants into biota. While wetland plants do not appear to be contaminated on these sites, the animals do. This use appears to be a viable technology. However,

the level and type of contamination need to be defined. Further demonstration should be conducted prior to widespread application.

PRIORITIES SET BASED ON RELATIVE RISK ASSESSMENT

All activities surrounding disposal of dredged material testing and impact evaluation are costly and time consuming. That is not to imply we should do any less or be any less vigilant than we now are. But in our experience, we continue to examine impacts at a level of detail that does not contribute to improvement of the environment or enhance our decision-making ability. We believe strongly that testing and evaluation practices and disposal management practices must be geared to the level of risk involved. The less time and money we spend chasing insignificant details is that much more time and money available to examine many of the remaining significant environmental problems of project activities.

POLLUTION PREVENTION

As alluded to in the discussion of cross media analysis, the maritime industry is saddled with the problem of resolving many pollution issues caused by others. It is indeed difficult to understand how such an inequity exists. If pollutants discharged from upland sources are so undesirable in the water and aquatic sediments, they should be stopped at the source. Alternatively, if the discharge from a permitted upland source is meeting the applicable standards, but special handling is required for disposal of dredged material rendered undesirable by this permitted source, it seems the originator of the pollution has some continuing responsibility to pay special handling costs to dispose of the dredged material. Army supports the provision in S. 1114 on pollution prevention planning.

CONCLUSION

In conclusion, I would like to reemphasize that Army supports the management and policy concepts of cross media management of pollutants, management and regulation of pollutants based on validated science and technology, prioritization of actions based on relative risk assessment, and pollution prevention, all of which are embodied in Title II of S. 1114. Enactment of these measures will assist Army to fulfill its mission of maintaining the economically important Federal navigation channels and harbors in an environmentally responsible manner.

STATEMENT OF JAMES R. BATCHELDER, VICE PRESIDENT, ENVIRONMENTAL AFFAIRS AND TECHNICAL SERVICES, KOPPERS INDUSTRIES, INC.

Mr. Chairman and members of the Subcommittee, thank you for the opportunity to present the views of the American Wood Preservers Institute (AWPI) on S. 1114, the Water Pollution Prevention and Control Act of 1993.

I am James R. Batchelder, Vice President of Environmental Affairs and Technical Services for Koppers Industries, Inc. Koppers Industries owns and operates 13 wood preserving plants in the United States. I am a past chairman of AWPI and remain active in that organization. I am familiar with the Clean Water Act and its regulations. I am accompanied today by John C. Chambers of McKenna & Cuneo, AWPI's legal counsel and Sherri G. Zedd of Neece, Cator, Barnicle & Associates, our legislative consultant.

The Institute is the national trade association representing the wood-preserving industry. Its members include manufacturers of treated-wood products; registrants of wood-preserving pesticides regulated under the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA); suppliers of raw materials and equipment; and providers of allied services (e.g., environmental engineering and consulting firms). AWPI member employ creosote, pentachlorophenol, copper-based preservatives, and inorganic arsenic-chromium formulations in the preservation of wood for consumer goods and for such industrial uses as railway ties, utility poles, and marine piling.

AWPI's comments primarily will address the wood-preserving industry's interest in maintaining the domestic-sewage exclusion (DSE) and recommended improvements to the effluent limitations and pretreatment standards process. We wish to stress four important points.

First, Congress should retain the domestic-sewage exclusion in Section 1004 of the Resource Conservation and Recovery Act (RCRA) to protect American industry's ability to continue to safely and efficiently discharge all wastewaters that have been pretreated to meet Clean Water Act and permit standards.

A critical issue for the wood-preserving industry involves the retention of the domestic-sewage exclusion under Section 1004(27) of RCRA for industrial effluents

that are discharged to publicly owned treatment works (POTWs). The industry is particularly concerned about Section 203(c) of S. 1114 which would we believe would jeopardize our use of the DSE.

Like many other industries, wood preservers produce wastewater that is: (i) listed as a hazardous waste under RCRA or (ii) contains hazardous waste. Where discharged to a POTW, this wastewater is subject to regulation under the Clean Water Act (CWA). The CWA requires pre-treatment of the wastewater and imposes rigid monitoring and discharge limitations on the wastewater generator.

AWPI opposes any ban on the discharge of wastewater to a treatment works that already is subject to permitting and pretreatment under the Clean Water Act and local authority. Unlike most other wastes, wastewater cannot be effectively land-filled or incinerated. The wastewater must eventually be released to the environment as a liquid or vapor.

Discharge to POTWs—in full compliance with the Act's pre-treatment requirements—assures that wastewaters are (i) properly and safely pre-treated by the generator, (ii) treated by the POTW, and (iii) discharged in accordance with a state or federal permit issued under the National Pollutant Discharge Elimination System (NPDES).

Additionally, under current federal rules¹, generators already are required to notify POTWs in writing that their discharge contains hazardous waste and to list the hazardous constituents in it.

We should emphasize this point: Discharge under the DSE does *not avoid* regulation; it simply *transfers* control of the discharge from RCRA to the Clean Water Act. The exclusion provides a cost-effective management alternative for industry and protects the environment.

Repeal of the domestic-sewage exclusion would eliminate an environmentally protective disposal outlet for industrial effluent meeting a Clean Water Act treatment standard.

Section 203(c) of S. 1114 would place wood-preserving wastewaters in the unusual position of being disposable at a RCRA Subtitle C facility, but being barred from discharge to a POTW *after these waters have been properly treated, using appropriate technology, to allow for safe discharge*. If implemented, this provision would create an unnecessary conflict between the two laws, produce confusion among regulated industries, and provide no additional environmental benefit.

Second, problems related to the DSE can and should be solved by proper implementation and enforcement of existing regulation of POTWs.

POTWs are already required to have pretreatment programs that regulate industrial discharges to their systems. The pretreatment requirement covers discharges that are or that contain hazardous waste. Congress should insist that EPA fully implement these requirements through enforcement and by providing help in developing standardized pretreatment standards.

NPDES permits for POTWs should properly account for connected industrial dischargers, as well as for specific local conditions. Thus, by meeting NPDES requirements and enforcing their own pretreatment requirements, POTWs will assure that industrial dischargers, including those taking advantage of the DSE, do not cause environmental harm or public hazard.

Third, pretreatment standards and effluent limitation guidelines (ELGs) do not provide the timeliness or flexibility needed. A more streamlined, efficient process should be implemented.

We believe that consideration of problems with the existing system is important because the Section 203(c) of S. 1114 makes use of the DSE dependent of the existence on—and compliance with—pretreatment standards. We have found the system of setting and updating pretreatment standards unworkable.

Pretreatment standards and effluent limitation guidelines (ELGs) must allow dischargers to apply these strictures with flexibility in relation to location specific situations and to changing regulatory and technical conditions.

The standards and guidelines for the wood preserving industry have been in effect for the wood-preserving industry since 1972 and they have not been substantially changed since then. When these standards and guidelines were promulgated, they represented the then-current state of the art in wood-preserving wastewater treatment. The wood preserving industry's effluent limitation guidelines prohibited discharge to surface waters. Similarly, the pretreatment standard for new sources (PSNS) also barred any discharge to POTWs. Nevertheless, the pretreatment stand-

¹ 40 CFR § 403.12(p)(1).

ard for existing sources (PSES) allowed discharges while limiting levels of oil and grease, copper, chromium, and arsenic.

The no-discharge requirement was accomplished by means that generally included primary oil-water separation, collection of wastewater in soil-lined surface impoundments, and treatment or disposal by evaporation in lined surface impoundments, or by treatment or disposal by evaporation or by spray application to land.

In 1980, bottom sediment sludge from the treatment of wastewaters from processes that use creosote and pentachlorophenol were listed as hazardous wastes under RCRA.

The Environmental Protection Agency (EPA) indicated that the accumulated sediment in surface impoundments was "storage" of a hazardous waste under RCRA. EPA's action made the continued use of surface impoundments impossible. Thus, many wood preservers closed their impoundments and installed treatment systems that discharged wastewater to spray irrigation fields because the effluent limitation guidelines prohibited direct discharges.

In 1991, EPA added "process wastewater" to the list of hazardous wastes from wood-preserving operations. EPA's action meant that the irrigation fields would require a RCRA permit for land disposal. RCRA permitting is not required for a discharge to a POTW or in accordance with an NPDES permit, however.

Most wood preservers who employ oilborne preservatives, including most Koppers facilities, now discharge pretreated wastewater to POTWs. But some plants, including three Koppers plants, are not served by sewer systems. Consequently, discharge to a POTW is not an option.

Because the effluent limitation guidelines require "no discharge," NPDES permits cannot be obtained for surface discharge. Thus, due to RCRA and effluent limitation guidelines, there is now no viable option for discharge of wood-preserving wastewater where a POTW is not available, no matter how well the water is treated.

The guidelines need to allow individual permit writers the flexibility to consider variances to the ELGs where changing technology and regulations make their application impractical for specific situations.

In addition, the process for reviewing and updating existing pretreatment standards and effluent limitations needs to be made workable. Due to changes in regulation and environmental standards, we in the wood-preserving industry have made substantial progress in our wastewater collection and treatment in the last 20 years. But the pretreatment standards and effluent limitations have not changed to keep pace. They are now out of date and do not provide appropriate standards for either surface discharge or pretreatment. Therefore, these standards and guidelines are generally of no use to permit writers. Many within EPA may recognize this problem, but the Agency is too busy developing new standards and guidelines to properly consider updating the existing ones.

With new industries springing up every day, it is not practical to expect EPA to write and keep current standards for every industry. In many cases, permit writers must comply with basin plans, toxics criteria, and other local concerns to the point the standards are of no use at all.

Guidelines should be promulgated only to address specific and widely applicable national needs. The guidelines should be reviewed periodically, such as every five years. Periodic reviews would allow EPA to evaluate and reaffirm the need for and the appropriateness of these standards.

Finally, the time limitation for appealing an ELG should be eliminated.

The Clean Water Act and EPA regulations provide a method for dischargers to appeal effluent limitation guidelines based on "fundamentally different factors" than were considered in developing the guidelines. Nevertheless, the statute and the regulations also require that a request for a variance based on fundamentally different factors be filed within 180 days of the date the effluent limitation was published.

No provision is made for factors that change after the effluent limitation has been promulgated. RCRA was substantially amended in 1984, land-disposal restrictions were imposed, and wood-preserving wastewater has been listed as a hazardous waste. Moreover, the state of the art of wastewater treatment technology has changed radically. Yet the effluent limitations reflect none of these changes.

EPA should be allowed to consider fundamentally different factors when issuing permits, whenever they become different, rather than being prohibited from such consideration. The time limitation for a variance based on fundamentally different factors should be rescinded.

AWPI and Koppers support responsible legislation and regulation. We encourage you, as you reauthorize the Clean Water Act, to consider our concerns. We also wel-

come any chance to work with you as the Act is considered by your Subcommittee and the full Environment and Public Works Committee. Mr. Chairman, this concludes AWPI's prepared testimony. I will be happy to answer any questions.

SENT VIA FACSIMILE - ORIGINAL SENT VIA MAIL

Mr. Bill Leary
Senate Environment and Public Works Committee
505 Hart Senate Office Building
Washington, D.C. 20510

Dear Mr. Leary:

I considered it an honor to have the opportunity to participate in the Senate Subcommittee on Clean Water, Fisheries and Wildlife hearings and, therefore, I welcome the chance to respond further by replying to Senator Graham's specific questions contained in his letter of October 12, 1993. As I understand it, the questions actually came from Senator Kempthorne.

My answers are as follows:

Question 1.

What do you see happening if the language regarding the domestic sewage exclusion in S.1114 is enacted into law:

Answer

The proposed domestic sewage exclusion (DSE) language contains overly broad terminology that introduces potentially prohibitive interpretation to the DSE which could defeat its original and intended purpose. That purpose is to provide for regulatory transfer of wastewater from RCRA solid waste to wastewater regulated under the Clean Water Act (CWA). In the case of the wood preserving industry, all wastewaters are RCRA Listed hazardous waste unless they are "delisted" or discharged to a POTW through application of the DSE. If the DSE is eliminated or restricted as contemplated by S.1114 the wood preserving industry would be left with no viable economic discharge option, regardless of the level of pretreatment.

Mr. Bill Leary
October 28, 1993
Page 2

Answer to Question 1 (Cont'd)

Moreover, by introducing the term "pollutant" and in a context where "the pollutant and source are subject to a pretreatment standard promulgated by the Administrator . . .", the proposed amendment creates an impossible burden on EPA and subsequent unfair and unnecessary prohibition on legitimate industrial dischargers. "Pollutant" as defined in the CWA is extremely broad. EPA could not possibly promulgate standards for all pollutants nor is it necessary from an environmental standpoint. Pretreatment standards under the CWA need only to be set for significant pollutants and discharges.

Question 2.

What types of industries depend on the domestic sewage exclusion?

Answer

The wood preserving industry has a critical dependence on the DSE to enable discharge because of the RCRA wastewater Listing, as explained previously in question No. 1. It is my understanding that other industries that depend on the DSE include chemical and specialty chemical manufacturers, textile manufacturers, metal finishers, flat glass industry, electronic interconnectors and food processors.

Question 3.

Would you comment on your industry's experience with the EPA's pretreatment standard setting process?

Answer

The existing EPA pretreatment Standards for wood preserving date back to 1972. They have not been updated and are consequently outmoded and unreflective of current technology or other regulatory changes that encroach. The standards do not allow direct or indirect discharges of process water pollutants from any new sources. A variance from categorical pretreatment standards for fundamentally different factors exists in the regulations under Subchapter N 403.13 but is unworkable to address changing factors over time due to a 180 day limitation following publication. Koppers has petitioned EPA for an exception to the 180 day limit with no success.

Mr. Bill Leary
October 28, 1993
Page 3

Answer to Question 3 (Cont'd)

The industry approached EPA and requested re-promulgation of its' categorical standards but was denied on the basis of agency priorities and inadequate resources. The process could work if allowed, but Congress or EPA management has to-date failed to provide for satisfactory implementation and maintenance of existing laws. One hates to see unnecessary changes embodied in the amendments imposed on an already belabored system at EPA.

Question 4.

Would you provide background on how you discharge your wastes before you began using the domestic sewage exclusion?

Answer

Prior to the Listing of wood treating wastewaters under RCRA in 1990 the DSE was not an issue. The regulatory history is interesting and revealing about the system.

Prior to 1972 most oil type wood preserving wastewaters received primary treatment, consisting of separation and product recovery, and direct discharged, generally through a detention pond. The 1972 effluent limits prescribed "no direct discharge" of process wastewater pollutants into navigable waters. This dictated an industry response to comply by constructing large surface impoundments to capture and preclude discharge of process wastewaters. Aeration treatment and spray irrigation were also often employed. In 1984 RCRA banned the use of these surface impoundments and required costly closure. This constituted the first regulatory push toward the Publicly Owned Treatment Works (POTW). The final push came in 1990 when EPA listed industry wastewaters therefore eliminating spray irrigation as it would constitute land disposal. With a "no discharge" standard for direct discharges the only viable option was to pretreat and discharge to a POTW under permit as enabled by the DSE.

Regulations have reduced this industry's discharge options to one; the POTW. To compromise the DSE jeopardizes the industry's remaining discharge option.

Bill Leary
October 28, 1993
Page 4

Question 5.

If you could not discharge your wastewater to POTWs using the DSE, what disposal options would you have? How would you rate these remaining discharge options in so far as their affect on the environment, compared to your current use of the DSE to discharge pretreated wastewater to POTWs?

Answer

Loss of POTW discharges, coupled with current categorical standards that allow no direct discharges, would leave no discharge options. Evaporation on site is an option, albeit unattractive. It is excessively costly and wasteful of energy. In the case of wood treating, evaporation could constitute RCRA hazardous waste treatment bringing with it the unacceptable regulatory T.S.D.F. baggage, air emissions, and likely Clean Air Act ramifications. It is even possible that listed wastewaters could be incinerated in an off-site RCRA T.S.D.F. facility but employing this option seems inconceivable.

Simply stated, wastewaters should be handled and regulated under Clean Water.

Question 6.

What kind of capital improvements to your facilities did you undertake in order to be able to use the DSE?

Answer

When forced to close surface impoundments the industry embarked on a program to investigate technologies, then design and install state-of-the-art, tank type pretreatment facilities. These varied depending on volume and specific requirements of the receiving POTWs. I can only speak for Koppers Industries, Inc. where the costs ranged between \$500,000 and \$3,000,000 per plant and we have 14 plants.

Question 7.

Would you describe the types of pretreatment that you perform before you discharge your wastewater to POTWs?

Mr. Bill Leary
October 28, 1993
Page 5

Answer

All of our plants perform primary treatment which consists of oil water separation aided by chemical flocculation which provides for recovery of reusable product from the wastewater. Generally, primary separation is followed by secondary treatment consisting of biological treatment in an activated sludge, an extended aeration system, or, in one case, U.V./ozone treatment. In all cases the wastewater discharges are monitored regularly by Koppers and the POTW.

I would be happy to answer any further questions you might have. Please feel free to call on me. As you can see, retention of workable domestic sewage exclusion is paramount to Koppers and the wood preserving industry, and numerous other industries.

I thank you for your interest and consideration of our answers and concerns.

Sincerely,

R. Batchelder
Vice President and Manager
Environmental Affairs and Technical Services
KOPPERS INDUSTRIES, INC.

cc: The Honorable Senator Dirk Kempthorne
SD 367 Dirksen Senate Office Building
Washington, D.C. 20510-1204

STATEMENT OF RICHARD L. HEMBRA, DIRECTOR, ENVIRONMENTAL PROTECTION ISSUES, RESOURCES, COMMUNITY, AND ECONOMIC DEVELOPMENT DIVISION, GENERAL ACCOUNTING OFFICE

Mr. Chairman and Members of the Subcommittee:

Despite efforts under the Clean Water Act to protect our nation's waters, states continue to issue health advisory warnings banning fishing and swimming in local waters, and environmentalists argue that limits on pollutants from discharging facilities are not stringent enough to protect the public. On the other hand, industry groups and other dischargers claim that pollutant limitations in discharge permits are often overly protective, based on insufficient scientific evidence, and unnecessarily costly.

Concerned about how the Environmental Protection Agency (EPA) and states are performing the tasks essential to developing sound discharge permit limitations, the full Committee asked us in December 1992 to assess (1) EPA's efforts to develop the technical information ("criteria") that states need to develop water quality standards which, in turn, are used to set facilities' discharge limits; (2) whether pollutants that pose serious threats to health and the environment are being discharged into waters but are not included on EPA's "priority pollutant list" for criteria development; and (3) how states have implemented the Clean Water Act's requirement to adopt water quality standards for pollutants for which EPA has prepared criteria documents. Our statement today presents information collected to date on the first of these issues, along with our preliminary observations and/or plans for addressing the second and third issues.

- Faced with limited funds and competing demands, EPA has made limited progress in developing and issuing the criteria that states need to develop water quality standards for the 126 priority pollutants. To date, EPA has issued human health criteria for 72 priority pollutants and aquatic life criteria for 27 pollutants. Nearly all of these criteria were developed in the early and mid-1980s, and few have been updated, as the Clean Water Act requires. Moreover, few are complete enough to allow states to set standards that would protect their waters against all of a pollutant's harmful effects. In particular, only 9 of the priority pollutants have criteria for the full range of possible effects on human health and aquatic life.
- Notwithstanding EPA's problems in addressing the 126 pollutants on its priority list, the agency concedes that recent scientific information indicates that other pollutants may seriously affect surface waters and may also warrant attention. However, the agency currently has no plans to modify or expand the list, explaining that such an expansion would not make the best use of the agency's limited resources. During the remainder of our review, we plan to examine EPA's basis for not including other pollutants on the priority pollutant list.
- Our preliminary review of state water quality standards suggests that the number and content of water quality standards varies significantly among the states. Some states have uniformly adopted the limits suggested by EPA's criteria, and others have modified them to be either more or less stringent than these criteria. Our fieldwork at selected EPA regions and states will help us to determine the full extent, causes, and appropriateness of this variation.

BACKGROUND

To help achieve its goal of restoring and maintaining the chemical, physical, and biological integrity of the nation's waters, the Clean Water Act requires EPA to develop and periodically review water quality criteria that states use as guidance in setting water quality standards. Water quality criteria consist of the technical information (such as the effects of various concentrations of pollutants on human health or aquatic life) that regulators need to place limitations on the amount of a pollutant that should be allowed in a waterbody, and on individual facilities' discharges into U.S. waters. Under a 1976 consent decree, EPA was required to develop criteria for aquatic life and human health for 65 pollutants and classes of pollutants designated as toxic under section 307(a) of the Clean Water Act. Because these toxic pollutants represented thousands of specific chemicals, developed a list of priority pollutants in 1977 that it would focus on for criteria development, that now consists of 126 such pollutants.¹

¹ The priority pollutant list developed in 1977 originally contained 129 pollutants; it currently contains 126 pollutants.

The 1987 amendments to the Clean Water Act mandated that in the case of each priority pollutant for which EPA criteria have been developed, each state must adopt criteria in their corresponding "water quality standards" that set allowable pollution limits on each of its waterbodies. Based on EPA guidance, individual states may modify its standards to include limitations that differ from those suggested by the EPA criteria documents, but all standards must be approved by EPA.

Water quality standards are eventually used by state permit writers to set individual dischargers' permit limits in such a way that the standards will be achieved. As we have reported in the past, in the absence of credible, scientifically based water quality standards, permit discharge limits may be over- or under protective, and become more susceptible to legal challenge.²

EPA HAS MADE LIMITED PROGRESS IN CRITERIA DEVELOPMENT

EPA has made limited progress in developing and issuing the criteria documents needed by states to develop water quality standards for the 126 priority pollutants. Our preliminary work indicates that EPA has published criteria for 86 priority pollutants. However, few of the criteria are complete enough to allow states to set standards that would protect their waters against all of a pollutant's harmful effects. For example, (1) human health criteria exist for 72 pollutants, while aquatic life criteria exist for 27 pollutants, and (2) and some of the criteria address acute effects but not long-term, chronic effects. Altogether, only nine of the priority pollutants have criteria for the full range of possible effects on human health and aquatic life.

Moreover, nearly all of these criteria were developed in the early and mid-1980s, and few have been updated to reflect new scientific information, as the Clean Water Act requires.³ In particular, all but 1 of the 72 human health criteria have been in effect since their formal publication in November 1980. EPA officials concede that new science may indeed justify changes to many of its published criteria.

EPA officials attribute the limited progress in criteria development to shortages of staffing and funds—the same the explanation we reported in our July 1991 report. During that review, EPA officials told us that, because of limited resources to develop data and perform analyses, they had to rely heavily on data published in various scientific journals.

In addition to resource limitations, we will explore at least two other reasons that may contribute to delays in EPA's future effort to develop water quality criteria:

- According to officials in EPA's Office of Science and Technology, the agency's process for developing chemical-specific criteria is time-consuming and costly. The development of proposed EPA criteria involves a detailed literature search, a peer review process and extensive laboratory testing. Proposed criteria are then drafted and go out for public comment. The process of crafting and publishing proposed criteria and deceiving and responding to public comments can take up to 9 months. From start to finish, the criteria development process can cost hundreds of thousands of dollars per pollutant and take up to 6 years.
- In addition to developing chemical-specific criteria for priority pollutants, EPA officials have cited the need to make more progress in developing other water quality criteria, such as biological criteria.⁴ We will examine the claims by these officials that chemical-specific criteria will have to compete for limited resources with these other criteria development responsibilities.

POTENTIALLY SERIOUS TOXIC POLLUTANTS NOT ON EPA'S PRIORITY LIST

EPA and other agencies have generated considerable data suggesting that pollutants other than those on EPA's 16-year-old priority pollutant list may pose a serious threat to water quality. Some of these data sources, which include information on pollutants entering surface waters, were generated under the authority of statutes other than the Clean Water Act. Foremost among these sources is EPA's Toxic Release Inventory (TRI), authorized under the Emergency Planning and Community Right-to-Know Act of 1986. TRI contains information on over 300 toxic chemicals released into the environment by industrial facilities. Pollutants potentially affecting surface waters have also been identified under programs authorized by the Safe

² *Water Pollution: Stronger Efforts Needed by EPA to Control Toxic Water Pollution* (GAO/RCED-91-154, July 19, 1991).

³ According to Section 304(a)(1) of the Clean Water Act, EPA's Administrator shall develop and publish criteria for water quality "accurately reflecting the latest scientific knowledge . . ." and shall "from time to time" revise these criteria.

⁴ Biological criteria gauge the health of the ecosystem by measuring the diversity of aquatic and plant life.

Drinking Water Act, the Federal Insecticide, Fungicide, and Rodenticide Act, and other statutes.

Officials in EPA's Office of Science and Technology acknowledge that many toxic pollutants identified through the Toxic Release Inventory, and other data bases compiled since the priority pollutant list was completed, may be causing serious surface water quality problems although they do not appear on the priority pollutant list. Nevertheless, EPA never expanded its priority pollutant list beyond the 126 previously identified, and officials have told us that they do not plan to do so in the future.

EPA officials explained, in part, that expansion of the list would not make the best use of the agency's limited resources, given its perceived need to focus more effort on developing biological, habitat, and other criteria. However, we believe this claim warrants examination because a more complete and up-to-date priority list could help ensure that EPA targets the limited resources it does devote to pollutant-specific criteria toward the most serious pollutants. EPA also argues that it has the flexibility to develop criteria for serious nonpriority pollutants and that it can ensure that a state will adopt a corresponding standard. Yet we found that regions and states typically focus on priority pollutants in adopting standards. For these reasons, during our ongoing review, we plan to examine more closely EPA's position of not including other pollutants on the priority pollutant list.

STATES' WATER QUALITY STANDARDS VARY

The Clean Water Act amendments of 1987 required states to adopt water quality standards, including numeric limitations (i.e., concentrations of chemicals present in water), in the case of priority pollutants that are expected to impair the designated uses of receiving waters, and for which EPA had published criteria.⁵ As we noted in our July 1991 report, many states were reluctant to adopt EPA's criteria as part of their water quality standards. EPA and state officials noted that (1) some states questioned the validity of scientific data, the methodology underlying some toxic criteria, and/or laboratory analyses EPA used to develop its criteria documents; (2) some believed that permit limits based on EPA's criteria were overly protective and too costly; and (3) some said that incorporating numeric toxic criteria into their water quality standards involved burdensome state rulemaking procedures. Ultimately, however, the required standards were adopted in all states.⁶

We are presently gathering information from each of EPA's regional offices on the content of states' standards. Our preliminary review of the information gathered to date reveals a good deal of variation in both the stringency and completeness of states' standards. For example:

- In adopting human health criteria for carcinogenic pollutants, some states use a risk factor of 1 in 1 million, whereas others use a less stringent standard of 1 in 100,000. Among the more controversial issues in states' adoption of standards is the case of dioxin: some states adopted EPA's recommended dioxin criteria, while others adopted a less stringent standard.
- Some states adopted standards for all priority and nonpriority pollutants for which EPA had developed criteria (whether or not they were being discharged), while others adopted standards only for priority pollutants, and only if they believed the pollutants were being discharged.

Our preliminary work suggests that many of the variations between the limitations in state standards and EPA's published criteria are consistent with the flexibility provided by EPA guidance. In particular, such diversity is often driven by site-specific variations from one geographic area to another. State, EPA, environmental, and industry officials, however, suggest that there may be cases for which such variations are not warranted and place certain dischargers at a competitive advantage or disadvantage.

During the remainder of our review, we will contact all regions and visit several states to ascertain the extent of variation among states' standards adoption practices and the reasons for such variations. We will also examine the consistency with which different EPA regions evaluate and approve state standards and the extent to

⁵ Section 303(c)(2)(B) of the Clean Water Act requires states to adopt numeric criteria unless such criteria are not available. If numeric criteria are not available, states shall adopt criteria based on biological monitoring or other specified assessment methods.

⁶ Fourteen states did not adopt all required standards. As a result, EPA issued a rule, effective February 5, 1993, promulgating standards for these states. 57 *Fed. Reg.* 60848 (Dec. 22, 1992).

which EPA headquarters encourages consistency of such oversight from one region to another.

SUMMARY

The nation's current system of controlling toxic discharges from industrial, municipal, and other sources relies on the use of defensible and scientifically based permit limits. Permit limits are based, in part, on states' water quality standards which, in turn, depend largely on EPA water quality criteria. Without sound criteria and standards, discharge permits may be either over- or under-protective of the environment, and may be more open to legal challenges.

EPA has made limited progress in developing and issuing the criteria needed by states to develop water quality standards for the 126 priority pollutants. Specifically, (1) criteria for some pollutants have not been developed, (2) most of the criteria that have been developed date back to the early to mid-1980s, and (3) few criteria documents are complete enough to allow states to set standards that would fully address a priority pollutant's harmful effects.

Our preliminary findings also suggest that a number of pollutants that seriously affect water quality are not on EPA's list and that the agency currently has no plans to modify or expand the list to include them. EPA has offered several explanations for this approach, which we plan to examine during the remainder of our review.

Similarly, our preliminary review of state water quality standards suggests that the number and content of water quality standards varies significantly among the states, although we have not yet determined the extent to which such diversity is justified. Our fieldwork at selected EPA regions and states will help us to determine the full extent and causes of these variations.

Mr. Chairman, this concludes our statement for the record. We appreciate the opportunity to present our preliminary findings on these issues.

REAUTHORIZATION OF THE CLEAN WATER ACT

WEDNESDAY, JULY 14, 1993

U.S. SENATE,
COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS,
SUBCOMMITTEE ON CLEAN WATER, FISHERIES, AND WILDLIFE,
Washington, DC.

NON-POINT SOURCE POLLUTION CONTROL

The subcommittee met, pursuant to recess, at 9:37 a.m. in room 406, Dirksen Senate Office Building, Hon. Bob Graham [chairman of the subcommittee] presiding.

Present: Senators Graham, Chafee, Lieberman, Durenberger, Faircloth, Kempthorne, and Baucus.

OPENING STATEMENT OF HON. BOB GRAHAM, U.S. SENATOR FROM THE STATE OF FLORIDA

Senator GRAHAM. This meeting will come to order.

This is the fourth in a series of hearings of the subcommittee on reauthorization of the Clean Water Act. Today our focus will be on non-point source pollution.

Despite the fact that much was known about non-point source pollution in 1972, the Clean Water Act, as originally enacted, primarily focused on point-source, industrial and municipal sources that discharged waste water from discrete pipes and ditches. The Act has been successful in bringing point sources into compliance. In fact, the Environmental Protection Agency believes that 87 percent of industrial, and 85 percent of municipal sources are in substantial compliance with permit requirements as a result of the Clean Water Act requirements.

However, as these sources achieve compliance, run-off from diffuse urban and rural sources, termed non-point source pollution, represents the largest portion of the Nation's remaining surface water problem. EPA estimates that non-point pollution represents over one-half of our remaining water quality problem.

I am very familiar with the impact of non-point source pollution on our Nation's water. Just yesterday, I participated in an important event in the restoration of the Florida Everglades, which has suffered in large part from non-point source pollution arising from a variety of sources, including the Everglades agricultural area. I have seen the harm that comes to an ecosystem from pollution run-off, and the difficulties in attempting to deal with it.

On June the 16th, this subcommittee heard from a panel of scientists who told us that non-point source pollution and aquatic habit degradation from non-point sources are two of the most im-

portant remaining problems facing America's waters. Non-point source pollution prevents full use of more than 75 percent of the rivers' miles assessed by States. About 20 percent of the Nation's lake acreage is affected by non-point source pollution.

In 1987 Congress created section 319 of the Act, the first comprehensive non-point pollution program. Nonetheless, little has been done to control this major source of pollution. Several concerns have been raised about implementation of section 319. Mostly, it has been criticized for inadequate funding and for a lack of vision. One of our witnesses today said that we have been running the program for six years like a demonstration project, rather than a serious, long-term commitment.

But the quality of assessments by the States of their non-point pollution problems has also been suspect. So, too, is the fact that there is no real consequence if a State fails to properly address its non-point problems.

Today one of the issues we should address is the adequacy of funding of the section 319 program. The Baucus-Chafee Bill substantially increases funding. The bill also requires States to reassess their waters and to identify impaired waters and provide financial consequences if they fail to do so.

We will also address how best to help agricultural and other interests reduce their pollution and the appropriate role of EPA, other Federal agencies, and the States in providing that assistance.

While next week's hearing will focus on watershed planning, it is impossible to discuss non-point pollution without reference to watershed planning. This is true both because most people believe it to be the best mechanism to address the problem, and because it is the approach which is taken in the bill before us.

For this reason, we will start today with the New York State Commissioner of Agriculture, Mr. Richard McGuire, and the New York City Environmental Commissioner, Mr. Albert Appleton, who can tell us briefly about the innovative approach they took to address non-point source pollution that was threatening the drinking water supply of New York City.

We will also explore the concerns of a variety of witnesses today as to how we can best improve the Clean Water Act so that we can achieve the same level of success with this form of pollution as we have achieved with others.

I am pleased to see that in our second panel today we have number of witnesses who actually earn their living on the farm, and thus can provide us a perspective that is not often heard in these discussions.

As can be seen, we will begin using the informal format that we tried at our last hearing. Because we wish to use this format to facilitate discussion, I'll ask our witnesses to make a brief opening statement, and then we will proceed to questions from members of the committee, as well as a discussion among the panelists. The full written statements, and any additional materials, will be made a part of the record.

I am pleased that we are joined today by the ranking member of the committee, and of this subcommittee, and one of the co-authors of the bill that we are using as the basis of our hearing, Senator John Chafee.

Senator Chafee?

OPENING STATEMENT OF HON. JOHN H. CHAFEE, U.S. SENATOR
FROM THE STATE OF RHODE ISLAND

Senator CHAFEE. Thank you very much, Mr. Chairman.

I want to subscribe to what you said in your opening statement. I also want to join in welcoming the witnesses here today. I think this is one of the more important hearings we have in connection with the reauthorization of the Clean Water Act.

It seems to me quite clear, as you pointed out, Mr. Chairman, that our best opportunity to improve water quality is to address these non-point sources of pollution; run-off from farms, and city streets, and forests and construction sites. As you pointed out, so much has been accomplished under the point source provisions of the Clean Water Act, that now non-point pollution is our number one water quality problem.

I might say this, Mr. Chairman: If the only thing we accomplish in the 1993 reauthorization of the Clean Water Act is to establish an effective, workable program to address non-point source pollution, I think this bill could be considered a big success. I think we should keep clearly in our minds that non-point source pollution is our highest priority.

As you mentioned, the bill that Senator Baucus and I introduced, S. 1114, has one element that I would like to stress. That is this: Based on our past experience, I'm convinced that regulations from EPA cannot be effective in solving these non-point source pollution problems. EPA can grind out all the regulations and we can have them working nights over there, but it won't do the trick.

What we really have to do is to have the landowners, farmers, or the forest owners, or the construction site owners, or the mayors of the cities, participate directly in the plans that are made to protect our lakes, and rivers, and streams, and bays in their own communities. We have to get this attachment of the belonging aspect, that these waters are their waters, the farmers' waters, and the mayors' waters.

This bill that we have before us does include incentives for, as you say, comprehensive watershed planning, for site-specific non-point control plans that give people at the local level a chance to shape the program. We are taking this approach because we believe that farmers and developers and small towns will happily agree to do more as authors of a local plan for their waters than EPA could ever do by issuing regulations from here in Washington.

So I look forward to this hearing. As you say, you have some really hands-on people, farmers who are farmers, and others here. I look forward to hearing their testimony.

Thank you.

Senator GRAHAM. Thank you very much, Senator Chafee.

I'd like to ask the members of the first panel if they would please come forward. I will briefly introduce them as they do so.

Mr. Geoffrey Grubbs, Director, Assessment and Watershed Protection Division, U.S. Environmental Protection Agency. Thank you.

Ms. Diane Cameron, of the Natural Resources Defense Council.

Mr. Gerald Vap, Vice-President of the National Association of Conservation Districts.

Mr. George Olszewski, of the Georgia Pacific Company. Mr. Olszewski is representing the American Forest Paper Institute.

Mr. Richard T. McGuire, New York Commissioner of Agriculture and Markets, and Mr. Albert Appleton, New York City Environmental Commissioner. Both of these are representing the National Association of State Departments of Agriculture.

I would like to ask each of the members of the panel to make a short statement. I would request you limit it to five minutes. We have a timing device. Your full statements and any other materials that you would like to provide will be incorporated as part of the record. After your statements we will move to questions and discussion.

It is my understanding that we are going to have a vote at approximately 10:30 a.m. I would hope that we might be able to complete our discussion prior to when Senator Chafee and I will have to leave for a vote, so that there will not be an interruption in the discussion of the first panel.

As I indicated in my opening statement, I would like to call on Mr. McGuire and Mr. Appleton. If they would kick this off with their statement as to what is being done in New York State in order to protect the water supply of New York City, then we will call on the other members of the panel in the order in which they were introduced.

Mr. McGuire?

STATEMENT OF RICHARD T. MCGUIRE, NEW YORK STATE COMMISSIONER OF AGRICULTURE AND MARKETS

Mr MCGUIRE. Senator Graham and Senator Chafee, I am pleased to be here this morning with my colleague, Albert Appleton from New York City. I think we have a real story to tell you. I will proceed as rapidly as possible.

My principal purpose is to describe to you the unique approach that has been adopted between the farm community and New York City in addressing its drinking water protection needs in its watershed, and its importance to the development of National non-point source pollution control policy. My remarks before you will be confined to the watershed program. I believe there are some important principles embodied in the New York City watershed agricultural arrangement that the committee may want to consider in reauthorizing the Clean Water Act.

The New York City watershed is rather unique. The successful effort that we have embarked on is based upon the prospective voluntary adaption of best management practices to control non-point source pollution by the more than 550 dairy farms and other farms in the New York City watershed area.

Farming has been practiced in the New York City watershed area of Delaware, Schoharie, Sullivan and Green Counties since long before New York City came to rely on the watershed for most of its water supply. The City has preserved its water quality in the midst of agricultural production for decades. So we approach from a point of strength, rather than a point of a problem. Our total

effort is focused on preserving that good quality, not having to correct a bad situation.

Efforts to improve farming practices, especially through the adoption of soil and water conservation techniques with the leadership of USDA Soil Conservation Service, delivered to the local soil and water conservation districts and ASCS offices have allowed farmers to maintain the economic viability of their farms by keeping their top soil on the land. This voluntary, locally based effort by farmers has a proved record of success, not just in New York State, but in most parts of the United States.

Let me say that because of the topography of New York—very hilly land, a lot of water systems, a lot of lakes and streams—soil conservation practices were initiated and were practiced probably ahead of most of other areas of the Country, some 50 years ago, with the focus being on keeping the soil on the farm, rather than the focus being on improving the water system.

So it is very applicable why this has happened already. Agriculture in the watershed has been changing. The pressures of the economics of dairy farming have led to larger herds of dairy cows, intensification of land use for crop production, and greater concentrations of animal waste. New measures based upon the proven path of voluntary and locally based approaches need to be implemented to cope with the increased requirements for drinking water protection and raw water quality maintenance for the New York City watershed area.

The Whole Farm Planning Approach Program is being implemented to meet the needs of farms in the watershed as well as the metropolitan area of the urban public, which is dependent upon this surface water supply. This approach is a result of a lot of hard work by all who were concerned about long-term protection of the City's water quality, while maintaining the agricultural economy as well.

In mid-1990, New York City circulated a draft of mandatory restrictive agricultural land use regulations that they thought were necessary to meet their goal of drinking water source protection without resorting to a full filtration system. Uniform and inflexible regulations were seen as unworkable and undesirable by the local agriculture community due to their negative impact upon the farm economy of the region.

In December of 1990, the New York City Department of Environmental Protection and the New York State Department of Agriculture and Markets cooperated in convening an ad hoc task force on agriculture and New York City watershed regulations. This group was composed of local farmers, local agricultural and environmental and government organizations of leaders, State representatives, and technical advisers. The Task Force was comprised of a policy group and a technical support group. Over a period of time they worked out a compromise position that was advantageous to everyone.

Farming in the New York City water supply watershed presents a complicated environmental management problem. Farming methods and practices are a potential source of non-point pollution. A locally developed and administered program of best management practices on a farm-by-farm basis was tailored, and is now being

implemented. The City, after consulting with appropriate bodies and after full review of Federal and State regulations, was satisfied that such a program would meet the avoidance criteria for effective watershed regulation. It represents the best strategy for dealing with concerns of both the city and farm community.

The whole farm planning and best management practices is now being put in place on farms in that area. Over a period of time we are sure they will be successful.

So I think my time is used up, Senator. May I continue a little bit?

Senator GRAHAM. You might take another minute or so to summarize.

Mr McGUIRE. I appreciate it.

The Whole Farm Approach to drinking water quality source protection integrates selected management practices intended to provide short and long term protection of water quality, with a farm business plan designed to sustain a profitable agricultural enterprise, given the mix of physical, capital, and management resources available to, and consistent with, the objectives of the farm operation.

I want to stress that we need this on a farm-by-farm basis. The thing we must avoid is mandatory regulations that are mandated on every farm, because no two farms are alike. Their soils are not alike; their geography is not alike; their type of agriculture that they may be conducting are not alike. So it is necessary, if we are going to have the result we desire, and also maintain a viable agriculture, which I am convinced is possible, we have to approach this on a one-on-one, individual farm basis.

This may be timely, but I am confident that the results will be satisfactory to everyone concerned.

I will be happy to answer any further questions.

Senator GRAHAM. Thank you very much, Mr. McGuire.

I would like to ask some questions, but I will hold those until after we have heard from all of the members of the panel with their opening statements.

Mr. Appleton?

STATEMENT OF ALBERT F. APPLETON, COMMISSIONER, NEW YORK CITY DEPARTMENT OF ENVIRONMENTAL PROTECTION

Mr. APPLETON. Senator Graham, Senator Chafee, I am pleased to be here today to talk about watershed protection and non-point source pollution.

The Dinkins administration in its environmental programs, both in the watershed, but also in the estuary, has made these programs a center-piece of our environmental strategy. I think it is very important to note some lessons from that experience.

One is pollution prevention is essential to effective non-point source pollution control. The difficulties in implementing best management practices and others give an enormous premium to keeping pollution out of the waste stream to begin with.

Technically, I personally feel the failure of non-point source pollution programs in the past has been a failure to address the messy politics of land use, and environmentally appropriate land use in

all its dimensions. A non-point source pollution strategy that fails to do that is doomed to failure.

This is why new institutional arrangements, particularly the watershed protection approach that S. 1114 is talking about, are enormously important to us. It is the kind of thing we have been trying to do in our programs.

As Commissioner McGuire laid out, we had a very difficult problem to face in the New York City watershed. There are some lessons to be learned from it. One thing that made our approach work is that we came up determined to meet an environmental goal, not to run a regulatory system.

In a sense, a regulatory system set a benchmark for us, but when the farm community came to us and said, "We can give you your water quality, but let us do this our way," we spent enough time testing their bona fides. Once it was clear that they would be seriously committed to our goal of water quality, then we were in a position to seriously commit to and to try out, their option of a non-regulatory, farm-by-farm, individual approach.

Another lesson is that local leadership is essential. I cannot speak highly enough of the assistance we got from the State Department of Agriculture, not only Commissioner McGuire, but Deputy Commissioner Dennis Rapp, who served as facilitator, and members of the local farm community, some of whom are identified in my written remarks.

A third thing is it is very important that we all learn a new language if we are going to make these deals work. Environmentalists, environmental regulators, environmental institutions have their own language. It is an insider's language. Environmental conflict has created a language. Voluntary, for example, is an enormous buzzword.

Senator CHAFEE. What was that word again?

Mr. APPLETON. Voluntary. The issue of whether this would be a voluntary program, Senator, was an enormously explosive issue politically. Farmers were determined to have a program that was voluntary for each farm. We, on the other hand, had seen many non-point source programs in the past fail, because the conscientious people are already doing it, or would participate in it and everyone else wouldn't.

The ultimate way we got around this problem was to take a new approach. That is, we established that the program would be voluntary as to any individual farm, but that the leadership of the agricultural community committed to work with us. It is their commitment to provide 85 percent participation within five years of this program or the City would be free to go back to a more traditional regulatory approach.

The City in turn agreed to fund the cost of this program as an alternative to the cost of running a regulatory system. So while we were able to satisfy the desire of the individual farmers for a voluntary program, we were able to meet our own need for a reliable critical mass of pollution reduction, which we estimate will be by at least two-thirds by the end of the decade.

We all took some political risks doing that. I must tell you, the first article in the New York Times quoted several of my environmental friends who had not read the fine print denouncing the pro-

gram because it was, quote, voluntary, not realizing how it had been structured. That there are political risks in these kinds of programs, regulatory systems, is certain. We have people in the watershed who want us to do all of the collaborative programs, but at the same time want us to have very specific, numerical standards for every single thing we do.

Now, the success of Whole Farm Planning has led us to a larger series of conversations throughout the watersheds—our watersheds are 2,000 square miles, the size of the State of Delaware nearly—with local towns, communities, forestry, and other business associations over what is now called the Whole Community Planning approach, in which we are offering to waive all or part of our regulation in exchange for community-based plans that will give us at least the same water quality protection and improvement that we would get from a regulatory baseline.

We are proceeding with the regulatory baseline. Our final new regulations will be out in November of this year. At the same time, the Mayor set \$120 million aside in a watershed protection and partnership program to fund these collaborative pollution clean-up programs on a town-by-town basis. We have six model towns we are working with.

Could I have one more minute to sum up?

Senator GRAHAM. Please do.

Mr. APPLETON. I think it is very important that we see these programs from an overall context. At the same time the City has been doing this collaboration, it has issued more clean water suits than any other jurisdiction in the country against polluters, and set aside over \$200 million for acquisition of core land areas around reservoirs, stream border protection, and other institutions.

A watershed program to be successful must be truly comprehensive to deal with non-point sources. It must be truly comprehensive.

My great worry is that watershed protection, the watershed protection approach will become just another bureaucratic layer, that we will look for a one-size-fits-all approach, but we will not promote the kind of local entrepreneurial environmental leadership that the farm community came forward with. I hope when we draft S. 1114, we have the courage to walk away from some of our own bureaucratic assurances to take the more risky, entrepreneurial, but I believe the only course that will be successful.

Senator GRAHAM. Thank you very much, Mr. Appleton.

I appreciate you and Mr. McGuire's background on what has been a very much watched National effort at non-point pollution control. I look forward to asking some questions in a moment.

Mr. Grubbs?

STATEMENT OF GEOFFREY H. GRUBBS, DIRECTOR, ASSESSMENT AND WATERSHED PROTECTION DIVISION, ENVIRONMENTAL PROTECTION AGENCY

Mr. GRUBBS. Thank you for this opportunity.

I am here today in two capacities: One is EPA's National Program Manager for the non-point source program, and in that regard I am looking forward to the discussion period so that we can

talk about how to make these programs really work. The other is to speak for the administration more broadly on non-point sources, in particular S. 1114 and many of the concepts you have advanced here.

Without reciting my testimony, I would just point that in the testimony there are 15 or 16 specific places where we support S. 1114. We think it is generally the right direction with regard to non-point sources and agree wholeheartedly with your initial statements here, that if we accomplish something really meaningful in the Clean Water Act reauthorization process it will be real change for non-point sources.

I also say in that regard we talked at some length with the Administrator, who is in Chicago today, and with persons at senior political levels at OMB and elsewhere, as well as a number of other Federal agencies to arrive at these positions.

I won't repeat your very thorough summary at the beginning, Senator, on the extent of the non-point source pollution problem, except to say we agree with it. We think this water quantity problem needs to be recognized and we think that your assessment of the importance of it is correct.

Moving beyond that, though, we do think in the administration that State-led programs are the best approach here. We also agree that section 319 is the best approach to take. It provides a good framework for us. We shouldn't be throwing it out and starting all over again with a new set of Federal and very different kinds of requirements. We want to rely upon States and local organizations and private landowners as this moves forward.

But, having administered this program for the last five years, my personal observation is that the differences we see among State programs are far more than can really be justified by the differences in local conditions. We are having some problems in some States getting programs up to a basic level of performance. I think that in moving towards new Clean Water Act, we need to take a hard look at what our bottom lines really are in section 319, and make sure we are getting the kind of performance from these State and local programs nationally that we need in order to solve the problems that you talked about.

Specifically, we very much support the notion in S. 1114 that we need to update State non-point source assessments. We, by that, I mean States, need to go through and update their non-point source assessments. EPA should retain the authority we now have under section 319 to act where States fail. But this is a central part of using our resources wisely and targeting programs to the places that have the greatest problems.

We do think that we need clear technical baselines for controls and practices that are needed. We support S. 1114's approach for EPA to establish guidance, not regulations, but guidance, for non-point source management measures. This guidance would lay out broad expectations for performance for these non-point source management systems that are general enough that they make sense when from Alaska to Puerto Rico, and are flexible enough that they can be tailored and adapted to site-specific conditions. We think that is an important baseline to establish.

We agree that these baseline management resource need to be develop together with other Federal agencies, as we did once in the past with the Coastal Zone Guidance, which has been discussed here previously. We support the approach in S. 1114 of putting the greatest weight of these best available management measures upon existing non-point sources in impaired areas where you have anticipate water quantity problem. This strategy is something we would specifically support, as well as extending that some level of non-point source control to significant new land disturbances in areas that are currently clean. This is a very sensible and practical approach.

We also support the use of site-specific plans adopted locally, and taking local circumstances into account. But we would like to make sure that as site-specific plans go forward there is some level of pollution reduction that is achieved by these site-specific plans that is commensurate with what the state of the art can yield.

We very much support the idea in S. 1114 of a 12 1/2-year time frame. This isn't going to be done overnight. You proposed in your bill two five-year cycles that would lead to full implementation of these management measures, but we would like to see this directed in the end toward water quality objectives, and think that we need to specifically recognize State water quality standards and designated uses as our main water quality objectives as the endpoint of our second cycle.

I won't talk at length today about watershed management and protection plans, since that is the subject of next week's hearing, but I will say that we generally do support the idea of deferring to show watershed programs crafted by States and responsible organizations. These water shed programs may be scientific but must be capable of meeting those environmental endpoints so that we can get to where we need to be in some reasonable time frame.

I'd like to make two more points, if I can.

The first is with regard to implementation, we do support a voluntary and consensus-based approach as a strategy of first choice. This is not going to be done overnight, and it is not going to be done through compulsion by EPA, that is for sure.

At the same time, as these programs are moved forward, and Soil Conservation Service and the many able State assistance agencies move forward with their programs, we do think it is important, up front, that States establish enforceable mechanisms in these improved non-point source programs that can brought into play after a reasonable time if voluntary means fail. They would be triggered as a last resort after the voluntary means fail. We think this is important.

We also support the notion that EPA should be empowered to act in the cases where those hopefully very few State and territories decline to take on the non-point source problems they have in front of them.

I'd just like to just say in closing that we do think we will be able to reap substantial benefits out of the approach that both of you have proposed and we are supporting here. With the delivery power of other Federal agencies, of States, of local and county organizations, and the individuals who decide to do non-point source controls because that is the right thing to do, not because someone

compelled them to do it, we think we will get to where we need to be in a reasonable time and in fashion, that we at EPA can administer.

Thank you.

Senator GRAHAM. Thank you, Mr. Grubbs.

Since we have started, we have been joined by Senators Durenberger and Lieberman. If either of you have an opening statement that you would like to make at this time, we would be pleased to hear you.

**OPENING STATEMENT OF HON. DAVE DURENBERGER, U.S.
SENATOR FROM THE STATE OF MINNESOTA**

Senator DURENBERGER. Mr. Chairman, I thank you very much.

Let me just say that as I walked in the door, and saw your hearing format, Jimmy Powell, my staffer, said, doesn't this remind you of the old days when there was an Intergovernmental Relations Subcommittee, and we would invite witnesses to come and sit up on the dais to help us examine other witnesses? We actually made progress inside that little room.

Since then they have dissolved the Intergovernmental Relations Subcommittee. Nobody but you, and some of the folks at this table seem to think in those terms anymore.

I just wanted you to know that two of us recalled that there was a day here 10 years ago when people thought in the kinds of terms that you do now. I want to urge you to continue to think in those terms.

It isn't just the style of approach, but it is your commitment. I know Joe Lieberman and John Chafee feel the same way about this. We can find a better way to get this done. Using the intergovernmental system more appropriately is a key to doing it.

Jim Oberstar is doing it on that side, and it reflects Minnesota's deep and traditional concern for the problems of non-point source pollution.

But, in Minnesota, like in the rest of the country, the problem is getting greater. Section 319, for a variety of reasons—we still think it is a great piece of work—but for a variety of reasons that we have pointed out here, we can't demonstrate great results.

I'm just here, number one, to compliment you and our ranking member for your commitment to take on the very, very difficult task. I pledge to you, as an original author of this, and person who comes from a place that thinks in these terms, I will do everything I can to help make this process a success. I certainly welcome all of the many people in this room who have been at this since 1987, some maybe longer than that, but at least since I got deeply involved in it in 1987. I see people in this room who have been at it that long. I appreciate your reaching out today.

Senator GRAHAM. Thank you very much, Senator. I appreciate those kind remarks.

Senator Lieberman?

OPENING STATEMENT OF HON. JOSEPH I. LIEBERMAN, U.S.
SENATOR FROM THE STATE OF CONNECTICUT

Senator LIEBERMAN. Mr. Chairman, I associate myself with what David has just said. I come to the Senate from having been a State Attorney General, and in that sense, a State enforcer of some of the laws that were passed here.

With that perspective, and which I appreciate seeing represented on the other side of the table, I agree that we are all in this together. It is this kind of intergovernmental dialog that will produce real and practical solutions, or at least amelioratives.

I would also like to compliment you again on this process, and to say that in Connecticut, as everywhere else around the country, we are coming to appreciate what a growing role non-point source pollution plays in water pollution problems, and how it is the next great objective that we all have if we want to truly make our Nation's waters clean, fishable, swimmable.

I look forward to the conversation.

Senator GRAHAM. Thank you very much, Senators.

Ms. Diane Cameron?

STATEMENT OF DIANE CAMERON, NATURAL RESOURCES
DEFENSE COUNCIL

Ms. CAMERON. Thank you, Senator.

I am giving my testimony on behalf of the Natural Resources Defense Council. We are working on many of the aspects of the Clean Water Act reauthorization through the 420-member Clean Water Network.

Senator, you gave some statistics already on the magnitude of the problem of polluted run-off, non-point source pollution. I would like to give a few more statistics that I think are particularly vivid, that help us to paint the picture about the magnitude of the problem, particularly in agriculture.

We are learning more and more around the country as scientists continue to study water pollution problems from agriculture. As one example relating to endangered species, about 37 percent of the 436 species listed in the Endangered Species Information System Data Base, which I believe is from the Department of the Interior, are imperiled at least in part by irrigation and the use of pesticides.

Fish kills are a significant impact that is attributed to agricultural run-off. In EPA's 1986 and 1987 summary of State reports on fish kills, animal feedlot and waste operations were blamed for one million fish killed. Most of that was estimated to have been caused by oxygen starvation from manure pollution.

To give another vivid example of that kind of a fish kill, I have an article from the May 29, 1993 Des Moines Register. Of course Des Moines is now dealing with another kind of run-off problem, which is of grave seriousness. There was a run-off problem in May. Liquid cattle manure flowed off of one farm and is believed to have been responsible for killing more than 178,000 fish in a very popular trout stream that is stocked regularly by the State.

That is one vivid example of what can happen if we don't have adequate controls.

Of course, soil erosion is huge, even though we do have a very strong program, at least in its construction. We have a strong conservation compliance program under the Farm Bill, without getting into details on its implementation. Nonetheless, we still have 1.6 billion tons estimated to have been eroded in 1987 from crop land. We still have a massive soil erosion problem that is serious.

A couple more brief statistics: The United States Geological Survey has found significant surface water pollution throughout the mid-western States of the Mississippi basin system attributed to herbicide run-off from current-use herbicides. For example, 52 percent of the sites examined by the USGS exceeded the primary drinking water standard for atrazine. 32 percent of the sites exceeded the primary drinking water standard for alachlor, and 7 percent for the herbicide, simazine.

This is a very significant study. It looked at 149 sites, and 122 river basins in 10 mid-western States. One of the reasons this is so significant is that these herbicides do not tend to be removed significantly by typical drinking water treatment plants. Thus, if they get into drinking water and the communities are not wealthy and do not have advanced drinking water treatment, and they are exceeding drinking water standards, it is a potential health concern.

I think I have given a few statistics that illustrate that this is a very serious problem. Earlier speakers have highlighted the fact that we need to move into a new era of run-off control, and run-off management.

In a nutshell, our view on Title III of S. 1114 is that it does move us into this new era of run-off management. We support many of the basic concepts in the run-off control portions of S. 1114. Notably there are six key elements in Title III that we particularly like.

They are: Whole watershed planning as the preferred approach for restoring water quality; number two, required management measures for new sources—we feel this is critical; number three, further coordination between water quality related Farm Bill programs and Clean Water Act programs; number four, encouragement of volunteer citizen water quality monitoring—although we feel that volunteer monitoring is so critical that States should be required to review and use such data; number five, significantly increased funding levels for non-point source programs; and number six, provisions for run-off controls for activities on Federal lands.

For example, there is widespread acknowledgement that overgrazing is a significant problem on our Federal lands, and there are some simple solutions to the water quality problems that it causes. We feel that the Federal lands provision in S. 1114 will help to move us forward in controlling that kind of a problem.

Just to wrap up, we support these basic elements of the run-off control policy in S. 1114. There are some strengthening changes that we would like to see made to it, but overall we think that it is on the right track.

Senator GRAHAM. Thank you very much.

Mr. Gerald Vap?

STATEMENT OF GERALD VAP, VICE PRESIDENT, NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS, McCOOK, NEBRASKA

Mr. VAP. Mr. Chairman, members of the committee, my name is Gerald Vap. I am from a small community of 8,000 people called McCook, Nebraska in the Southwest corner of the State.

I represent the National Association of Conservation Districts as their vice president. We speak for the 3,000 soil and water conservation districts around the Nation. Possibly more significant than that is that I am the chairman of our local conservation district. We in the past three years have instituted in Nebraska what is known as a special protection area for non-point source pollution.

Through several years of testing, data gathering, we determined that our groundwater was becoming degraded by nitrate and nitrogen. We brought to bear the programs of the EPA 319 program, ASCS's WQIP program. We use the Soil Conservation Service, use the Extension Service, our State and local agencies, all to institute this program.

We have an area that we have designated as endangered, 450 square miles within our district. We are in the process of stopping any further pollution from nitrate and nitrogen. We are doing it with incentive driven, voluntary programs, education, things that the 319 program does best. We are doing it with locally conceived programs, and with great cooperation of the farmers and the communities in that area.

We would, as a national association, agree with Mr. McGuire, and we are pleased to hear him give credit to the Soil Conservation Service and our local conservation districts for helping them perform a great service to the people of New York in developing their programs. I think they are to be commended. It is a good example of how site-specific planning, which we support, and State controls of the program, State development along with the local conservation district and local people cooperating as to what NACD stands for in this particular program.

We do like several things in the new reauthorization law. We go for the site-specific planning, the State roles in continuing to expand on their non-point source problems, identify those problems, and develop programs that will take care of those on a site-specific basis rather than trying to come up with a one T-shirt fits everybody type of thing. It doesn't work in any particular situation. Soil types, watersheds, they all are different. They all need to be looked differently and planned for differently.

Having gone through applying for 319 funds for our local district, we find that it is an excellent program. It perhaps needs some streamlining. It takes longer to get those funds than we had anticipated, but they are coming forth. They are doing a good job now, but perhaps there is some streamlining that could be done there.

We would agree that as a national association that funding is extremely important. If the Congress of the United States is to pass this legislation, asking the States of this Country to come up with a better method of handling non-point source pollution, they also need to come up with the financial and technical resources to do

that job. Financial support for the States and local entities, but also the technical support needed.

We feel that is best supplied by the Soil Conservation Service of the USDA. They are experts in that field. They probably will do the best job, we think, but we need to be serious about funding and technical support to make this work.

We have a few concerns about the time-frame. We think the 180 days is a little too short for the EPA to come up with their portion of it, and six months for the States to respond is a little bit short. We would like to see you expand that.

In general, we agree with the bill. There are just a few things that we would like to see change. I would be happy to expand on our local program, or anything NACD stands for.

Thank you.

Senator GRAHAM. Thank you very much, Mr. Vap.

Mr. Olszewski?

STATEMENT OF ROBERT OLSZEWSKI, REPRESENTING AMERICAN FOREST AND PAPER ASSOCIATION

Mr. OLSZEWSKI. Thank you, Senator Graham and members of the subcommittee.

My name is Rob Olszewski. I am manager of forest hydrology for Georgia Pacific. I have been in that position since March, but I come to you more as a Floridian. The last six years I have been down there working with the State Forestry Association, and the six years before that I, in fact, was the key employee with the State Division of Forestry, involved directly with the implementation of BMPs on forest lands across that part of the world.

I am speaking today on the part of AFPA, the American Forest and Paper Association, which is the national trade association for the forest products industry. I am also a small landowner. I own three small tracts of land in the Tallahassee and South Georgia area, and I have some streams on it. So I guess I can speak from that prospective to some extent also.

Senator GRAHAM. I thought you were a person who looked unusually, healthy, happy, and prosperous.

[Laughter.]

Mr. OLSZEWSKI. I knew we could talk today, Senator.

[Laughter.]

Mr. OLSZEWSKI. Although this hearing is confined to issues affecting non-point source run-off, we would request, with your permission, Mr. Chairman, to submit a longer statement for the hearing record which details some serious concerns our industry has with a number of, especially, point source issues contained in the bill. We will do that at a later appropriate date.

The forest industry, which includes about seven million small, private woodlot owners like myself, has been implementing non-point source BMPs, what is in effect called management measures in S. 1114, for a number of years since passage of the 1972 Clean Water Act. All States with significant forest management activities have either passed forest practice laws or developed BMPs approved by EPA, we might add, to minimize the impact of timber harvesting on water quality.

Consequently, forestry activities contribute relatively little to water quality impairment as opposed to other land use activities. According to even EPA, forestry contributes on average only six percent of the loadings attributed to non-point source pollution.

Beyond the quantity issues there is also the question of quality. Run-off from forests has been demonstrated to be much cleaner than that from other types of land uses, as well.

With regard to forestry, we ask you to move forward with extreme caution on any non-point source pollution legislation, to consider the approaches that we think are working well today.

First we'd urge you recognize highly successful efforts already being made now implementing management measures, particularly in silvicultural management. State reporting requirements under Section 305B, State BMP, and auditing programs, EPA section 319 reports, and various studies by the industry's national council of paper industry for air and stream improvement confirm that forest management activities represent, really, a de minimis contribution of non-point source water quality impairment.

Many audits have been conducted by individual States to indicate the effectiveness of State forestry non-point source programs. The audit conducted by the Division of Forestry in Florida indicates approximately 94 percent compliance today with BMPs. In Virginia, the figure is roughly 90 percent, in South Carolina, 85 percent. These numbers have been achieved through existing programs and the existing outreach efforts on the part of the industry and the States. We want to do anything we can to expand and intensify those efforts.

Notwithstanding those efforts, the industry is committed to implementing BMPs on all lands across the country. It is very important that BMPs should continue to be developed on the basis of State-specific characteristics. Each State has its own special, unique circumstances of land ownership types, land uses, State resources, program costs, existing State statutes, social institutional characteristics.

Because all the State programs reflect those characteristics, AFPA would oppose the concept of allowing EPA to establish a program implementation criteria in Section 304 of the bill for all States based on the demonstrated success in only one State. We would worry in Florida, Senator, what kind of impact that might have on things like this that we have done in our State down there.

We have recently completed a pretty detailed effort—I'll leave this for you—to develop a revised BMP approach with a 22-member task force that met intensely for a 15 month period, consisting of folks from the environmental community, like Bernie Yokel, Judy Hancock—I know you know—folks from the forestry, academic types, agency types to complete that effort for a Florida-specific example.

Although the bill gives discretion to the administrator through the EPA Regents to modify management measures to reflect conditions in the regions, we are concerned that this authority might be unworkable, since even the geographical features within the States of the various regions differ greatly. States, not EPA, must have

the flexibility to devise management measures to address their own special circumstances.

Any non-point source program should avoid having a prescriptive approach to land use planning. We are deeply concerned over the application of water quality criteria and standards provisions to non-point sources.

The anti-degradation section in particular requires designation of any water body within a National forest or water of exceptional recreational, cultural, or ecological significance, including any that supports a population of threatened or endangered species, and would drastically affect our ability, we feel, to harvest timber on millions of acres of Federal and private lands.

We think the bill needs some work at this point, Senator. There may be some things, some references in the bill that may not be intended, but we see some potential problems out there from an implementation standpoint, and how it might affect us directly, the anti-degradation on RWs, to give one example.

I'll be glad to answer any questions in relation to these statements.

Senator GRAHAM. Thank you very much, Mr. Olszewski.

As I indicated earlier, we may be interrupted shortly by a vote. I'd like to start the questioning. Then we will take a round, with each Senator having five minutes to ask questions. Again, I would encourage dialog among members of the panel.

As Senator Durenberger said, one of the key issues here is the intergovernmental issue. As I read through the legislation that is before us, one of the principal areas of alteration is the increase of the Federal role. For instance, there is the provision of National program guidelines that a State would have to meet in its submission of a non-point source pollution program.

I would be interested in your comments, starting with the experience from New York State, as to what do you see as the most appropriate role of the Federal Government in terms of standard setting, and direction to State and local communities in development of their non-point source pollution strategy?

Mr. McGUIRE. Senator, I think we have already outlined one approach. I want to make a very distinct point. I am also a farmer. I not only represent NASDA—one that—I represent New York State as Commissioner of Agriculture.

I have been a farmer all my life. I am a third generation farmer. I have had first hand experience with soil conservation and all the things that go with it. I know of no farmer that intends to pollute. That is one of the problems we are talking about.

There are primarily two or three things. One is the use of fertilizer, pesticides, handling of livestock manure. The thing that happens is that we have the possibility, and in fact have examples of, overuse of any of those commodities beyond the point that the soil on that particular farm can adequately handle it, or that the crop growing from it adequately. So we have something left that can, and is potentially, a pollutant. It may stay there, but in a rain storm or a unique situation, it can be washed off into the streams, and there is where the work is needed to be done to prevent that happening.

Primarily, that is why the whole farm approach is necessary. One, to change whatever practices need to be changed on the farm itself; and two, to construct berms, concrete waterways, grass waterways, concrete barnyards, whatever, other things if necessary, to minimize the potential for run-off under heavy rain conditions, for example.

I want to make one other point though. The food supply for all of us is dependent on less than two percent of the population. I would remind that these people are volunteers. They are not slaves, and they are not government employees. They are individuals. They can choose to farm, or choose not to. We are threatened more in our future food supply by these people choosing not to, than they are from the loss of land, or the resources they use to turn into food.

When they become extremely unhappy with their situation, so that they feel rules and regulations are burdening them to the point where they can't handle it, they are going to do something else. So it is necessary that we work with them, as we have been doing in New York, on a voluntary basis.

They can't be ordered to stay on the farm. They can be ordered to do a lot of things to a point. At that point, I guess they say, "I'll do something else."

My real concern is the next generation. They are already making that decision. We see it all over New York State; we see it all over agriculture across this Country, that they say, "Dad, I don't want to be a farmer." That concerns me greatly.

Let me say that we are doing things—and I think probably because of our population, probably because of our extensive water systems, and lakes and streams, probably of the type of agriculture we have—we have instigated IPM programs to control the use of pesticides, reduce the use of pesticides. We are doing much more in our soil testing, much more in our use of fertilizers. We are doing much more in the continuation of conservation. Now we have a task force, which you will about a little later this morning, on the handling of manure.

I think those things are things that farmers are very willing to do. I think we are going to find that they are going to control the problem to the extent that it can be controlled. I want those to continue.

I think it is necessary that the public is involved in it, not only in a quality water supply, but also in quality food supply. Therefore, the cost of doing some of these things may be beyond that farmer's ability to pay for them. Because of his location next to a stream or a lake, because of the type of operation he has, he has an expense that exceeds other farmers who he is competing with producing that same commodity.

In those kinds of situations, I am very pleased with what we are doing in New York City, where they are sharing the costs of doing those things that are necessary in the public interest. I think it is not in the public interest as far water supply goes; it is in the public's interest as far as the food supply goes.

Senator GRAHAM. Thank you very much, Mr. McGuire.
My five minutes has expired. At this point we will adjourn.

Senator CHAFEE. Mr. Chairman, I just want to say, I think Mr. McGuire has given a very, very powerful speech on behalf of the farmers and this two percent of the population that does such a wonderful job for us. The point that he has made that they can't be ordered around or they might just leave, is one which we all must bear in mind.

I think it is a good statement, Mr. McGuire. I am reminded of a bumper sticker I saw the other day, "If you like to eat, you should hug a farmer today."

[Laughter.]

Senator CHAFEE. I thought it was a good statement. It brought some points home to all of us.

Senator GRAHAM. We will adjourn until we complete this vote. Then we will pick up with Senator Chafee being the next questioner.

[Recess.]

Senator GRAHAM. We will reconvene.

Senator Chafee is called upon for his insightful questions.

Senator CHAFEE. Well, I am not sure I qualify in that, Mr. Chairman, but thank you.

First, I would like to say that both we on the committee, in our opening statements, and most of the witnesses have said that the principal cause of the remaining pollution in our lakes, rivers, and streams is from non-point sources. It is peculiar that currently we provide \$2.4 billion for point-source control, and something like \$50 to \$100 million for non-point source. I am not sure that our actions are meeting our rhetoric around here.

I suppose that one of the reasons that the point source funding is so popular is that it creates jobs. You see something very visible. You see a sewage plant built in a small town that doesn't have one and is suddenly going to get one. Whereas, non-point source controls doesn't seem to create jobs. It is not visible, tangible.

It seems to me one of the problems that has come up through the testimony here is manure management, and just what to do. I know that in my State you are seeing the dairy farms operate with far less acreage than they formerly did. They are buying their hay, in many instances, from around the State. Once upon a time they would take the manure and just put it in the spreader and go out in the fields, and that was the way you disposed of it.

But that isn't true to the extent it once was. Are there any ingenious steps being taken? I noticed in the testimony of one of the witnesses—I think you, Ms. Cameron—didn't you talk about some steps that they are taking in Cornell and elsewhere to do something about that?

Ms. CAMERON. I did talk about the problem of manure management.

Senator CHAFEE. It doesn't quite operate up there on the level with the high culture, but it is a problem.

Mr. APPLETON. Senator, I think it is my statement.

Senator CHAFEE. I think the more subtle way that I think Mr. McGuire termed it was waste management, didn't he? Farm waste, but anyway it gets right down to manure.

Mr. APPLETON. If I could talk a little about that?

Manure is kind of the same thing as sludge. It is bio-solvent. People have the same aversion in talking about animal manure that often you find when you have to talk about sludge that comes from human manure.

I think it is clear from our experience, and it is one of the recommendations in our testimony, that 319 programs are going to have to be brought in to provide for region-wide facilities. We are going to have to take, at least in the dairy industry, some of this manure off the farms and give an environmentally useful kind of product, either by composing or turning it into another product for beneficial use. There is a lot of experience in sludge management that I think could be very applicable here.

The other thing in terms of manure is we are sponsoring some research at Cornell into pathogens. One of the interesting things that so far is emerging from this research is that young animal manure, calf manure, may actually provide a majority of source cysts and other water borne pathogens into the water system. We are looking at maybe setting up as part of this whole farm community plan, because one of the things we have had to do is develop a whole protocol of BMPs for pathogens, maybe requiring calf manure and baby animal manure different treatments, including some kind of thermal process.

I think you need to think about these issues in terms of regions and system-wide areas.

Senator CHAFEE. What do you say, Mr. McGuire? You are a hands-on man.

Mr. MCGUIRE. I think it would be worthwhile.

Because you mentioned it Senator, the evolution of handling manure obviously has followed to some degree the evolution in the size of dairy farms. But you are right, historically, we used to handle it every day, spread it fresh on the land every day. As the size of farms increased, this became a little bit more of a problem. Also, there were some other things related to it.

One is the area that you put it. We used to draw it out and put it in piles, too, which caused a lot of pollution potential from that particular spot. So the evolution has involved handling large quantities in a very short period of time, doing that for labor management purposes, really. That brought around some new problems.

New problems being there is a lot of focus of attention on a lot of manure spread in a short period of time, odor problems, potential pollution problems. A lot of things that had to be done couldn't be done on frozen land, which half of our Country experiences. So they did it in the Spring. Also that is when they plant their crops.

They had a short window between when the frost went out of the ground, and they could put it on the land and plow it under when they planted the crop. After they planted the crop, the window was closed. What do you do with the manure until the next season rolls around? They developed large storage systems.

They have referred to fish kills and so forth. All of those happened from either failure of a storage system, or sabotage of one, which is always potential, and the fact that when you store large volumes of it, and you do have an accident, or something happen to it, you have a sudden flooding situation that results in great damage to the environment, great damage to the wildlife.

The evolution to accomplish one purpose, also causes some new problems. That is why a very speeded up and active group of people in New York State went college and are working intensively on accommodating this and solving these problems. I think there is a lot of research going on.

Senator CHAFEE. My time is up, Mr. Chairman, but I spent a lot of time as a child on my grandfather's farm, and I just want to confirm what Mr. McGuire said, that winters they'd take that manure and put it right out on the fields, and I suppose it was violating best management practices of these days, but in those days it was just the way you got rid of the manure. You took it out and spread it in a very timely fashion.

Your testimony touches on doing some more research, I might have some questions later, Mr. Chairman.

Thank you.

Senator GRAHAM. Thank you very much, Senator.

We have been joined by our chairman, Senator Baucus, and also by Senator Faircloth. If you have an opening statement that you would like to make, please do so.

OPENING STATEMENT OF HON. MAX BAUCUS, U.S. SENATOR FROM THE STATE OF MONTANA

Senator BAUCUS. Thank you very much, Mr. Chairman.

I first want to congratulate you on your efforts in the subcommittee to address the problems of Clean Water.

It is clear this will be the major environmental bill passed by this Congress this year. You are to be commended, Mr. Chairman, for your very diligent work in helping to put this together. All of us in the Congress, certainly more importantly the people, particularly the groups interested want to express great gratitude.

Mr. Chairman, as we turn our attention to the complex problems of diffuse, or non-point source pollution, it is important to recognize that the causes of the non-point source pollution come from run-off of rain water from urban areas, a wide variety of areas; construction projects, forest harvesting, agricultural lands. It is very diffuse. It is very complicated. It has been a very illusive goal of the Clean Water Act which since 1972 has tried to control it.

While we have made substantial progress in reducing water pollution from point sources, we have not yet in any way solved the problems with respect to non-point source pollution. In developing an effective non-point control policy has been difficult for several reasons.

Non-point source pollution results first from actions of tens of thousands of individuals, making decisions about land management. Many times individual decisions by themselves do not cause pollution. The cumulative effect of these decisions do create significant pollution problems.

Even when the problem sources are clearly identified, Federal, State, and local governments have all been very cautious in the past about asking or requiring change in land management practices. It gets at the very root of land management, which is something that is very difficult to remedy.

In the past several years, however, I think there has been considerable and sometimes angry debate over the extent of the problem and the best solutions. I believe we have a much better chance of developing an effective and workable non-point control program than ever before.

Why do I say that? I am optimistic basically for three reasons. First the recent debates over non-point source pollution have helped all parties gain a better understanding of the issue, and a much better appreciation of the perspectives of others. This was a difficult process. It is one that has been on-going for the last year or two, but it may well have been essential to an eventual solution.

Second, I believe that the bill we have before us is a good starting place. It is a good starting place for our legislative discussions. It builds on existing State programs, and gives States the lead role in addressing the problem. It targets pollution control efforts on impaired waters identified by States. It provides for the development of tailored, site-specific responses to identified problems. It will help prevent the development of new problems from new projects and activities. And it includes substantially increased funding, including cost sharing, implementation of management practices, which on a level comparable to the problem.

Finally, I am optimistic about our chances of finally solving the non-point source pollution problem because those on both sides of the debate are turning from rhetoric to constructive solutions. The environmental community has recognized the complexity of the problem and the time needed to solve it. The agriculture community has recognized that more can be done to prevent water pollution, while reserving the balance between conservation and production.

The legislation we are considering today will help bring the considerable energy and inventiveness of the agriculture community to the difficult problem of protecting the quality of our rivers, streams, and lakes. Working together, government, environmentalists, the agriculture community can fix the non-point source pollution problem.

Thank you very much, Mr. Chairman.

Senator GRAHAM. Thank you very much, Mr. Chairman.

Senator Faircloth?

**OPENING STATEMENT OF HON. LAUCH FAIRCLOTH, U.S.
SENATOR FROM THE STATE OF NORTH CAROLINA**

Senator FAIRCLOTH. Thank you, Chairman Graham.

I am in the unique position of having spent, and am still spending, my entire life in the farming business. It has been a central core of the business life that I have been in for 47 years. I am well familiar with management practices regarding water pollution. I know they have come a long way since I first got into business in Immokalee, Florida, Senator Graham, in 1947.

I want to see a cooperation and not a coercion on the way this operates. I have heard the conversation here today about the handling of manure, and I want to point out that North Carolina has probably come farther in dealing with this problem than any other State. The North Carolina water quality manager is scheduled to

testify at our next hearing. I look forward to hearing to what he has to say.

I read very briefly some of the things Ms. Cameron had to say on waste. I heard Mr. McGuire talking about storage.

As I say, I come from a unique part of the country. We have seen big farms sprout up in that immediate area. Farms that do \$100 to \$300 million in annual sales.

Some of the methods discussed by Ms. Cameron in her statement about how to handle these things sound pretty much like amateur night to me compared to what we have been doing for many, many years. It is inconceivable not to soil test a field for every possible nutrient before you even think about row cropping. We are not in the row crop business, particularly, but some are.

We have spent, on our farms, millions of dollars just getting rid of waste from hog operations, and doing it in a very sophisticated way, on to grass lands. It in turn forced us into the cattle business.

The immediate area that I am in produces something like 35,000 hogs on a daily basis, and somewhere in the neighborhood of 350,000 turkeys on a daily basis. Our handling of the waste is very sophisticated, and comes far ahead of some of the amateurish things we are talking about here.

Ms. Cameron, if I may ask one quick question, has anybody in your organization ever been in farming?

Senator GRAHAM. Senator Faircloth, we are going to proceed through on questions on a normal basis. Then you will have an opportunity ask Ms. Cameron whatever question you'd like to pursue.

Senator FAIRCLOTH. Thank you.

Senator BAUCUS. Mr. Chairman, I have one question.

Senator GRAHAM. I'm sorry, we have been joined by another member of our committee. I am very pleased to see the participation of the subcommittee members on this topic. Again, emphasis on how important the non-point source pollution is.

Senator Kempthorne, do you have an opening statement?

OPENING STATEMENT OF HON. DIRK KEMPTHORNE, U.S. SENATOR FROM THE STATE OF IDAHO

Senator KEMPTHORNE. Yes, Mr. Chairman, I do, and I thank you.

Mr. Chairman, few sections of this clean water reauthorization bill has a more profound effect than those governing non-point source pollution. Timber, mining, ranching, agriculture are the most often named sources for non-point source pollution, and have been the backbone for Idaho's economy for generations.

Each of these industries are under considerable stress right now, in the most part because of decisions made or actions taken by the Federal Government. I am therefore particularly concerned that those steps taken in the area of non-point source pollution control or prevention are realistic and, very important, flexible. They must provide substantial benefit for the cost involved. The requirements must be minimally burdensome.

Additionally, Idaho has moved forward in developing an increasingly effective program to deal with non-point source pollution. The hallmark of Idaho's program is local control, and substantially, flexibility in the development and application of best management

practices because of variations in soil, climate, hydrology, and other factors. I believe that Idaho's best interest in improving water quality requires protection of these strengths in Idaho's program, and the preservation of similar characteristics for non-point source pollution programs in other States.

I have numerous concerns about the non-point source pollution provisions in both title II and title III. We probably won't have an opportunity to address all of them today, but I hope that we can get a start on them.

I appreciate, Mr. Chairman, your efforts on this very important issue, with reference to when now Administrator Browner was before this committee for her confirmation hearings, and we discussed this possibility of building into the system flexibility so that local conditions can be taken into account in order to achieve the standards that have been set.

I appreciated her approach on that, and I look forward to participating with the panel.

Senator GRAHAM. Thank you very much, Senator.

Senator Baucus?

Senator BAUCUS. Thank you, Mr. Chairman.

I'd like to ask a couple of questions of Ms. Cameron, and also Mr. Grubbs. I have two questions.

Basically, first, the enforcement question. NRDC is concerned that as the bill is written that the State does not have the authority to bring injunctions and other similar judicial action with respect to an operator or somebody who is not complying with the best management practices, or if that is applicable, or the State site-specific plan, if that is applicable, or the conservation, or whatever it is.

Would you give us again your concerns of why you think that there should be enforcement included? When you answer that question, I wish you would also address the other side of that coin, namely that we are trying to develop a plan that is going to work here, that is going to have some acceptance by people generally.

I am thinking a bit of the Clean Air Act. Years ago this Congress passed a Clean Air Act that was just too ambitious. It moved too quickly. We had to, in 1990, reauthorize and pass amendments to the Clean Air Act extending time tables and so forth that were more realistic, because States just were not adopting their implementation plans, and communities were not meeting the standards set at an earlier date.

I guess the argument is, wouldn't it be better to set in place a plan or a scheme that people that begins to get acceptance in the State, and among the operators, and so forth, then kick in enforcement at a later date, rather than trying to pile everything on operators all at once in the earlier time-frame?

Ms. CAMERON. OK. I guess I will take a crack at responding.

First on the enforcement part of your question, the bill, S. 1114, does make a distinction between new sources that are required to undertake management measures that are in some way envisioned in the bill to be more of a proscriptive set of measures than for existing sources.

First of all, for new sources, ground that is now pristine in some way, that is going to be broken under new farms, or new logging—

under the bill particularly new logging sites, construction sites—this ground, when it is broken, we feel should be required to have management measures that are not dictating the exact nature of the enterprise, or the exact nature of the land-use, but that are requiring that run-off be prevented as much as possible, to the maximum extent possible. We believe that for every land-use category there are prevention techniques that are known to that industry. The problem is not so much lack of technology, lack of knowledge, as it is lack of consistent, enforceable requirements that are on the books of every State.

For example, local zoning are needed to be upgraded to have prevention based site design for new urban development. That is just one example.

That is one example where that a very strong, enforceable measures and mechanisms need to be in place right away.

Senator BAUCUS. Why isn't the State enforcement sufficient?

Ms. CAMERON. Why isn't State enforcement sufficient?

Senator BAUCUS. Why aren't the State development of site-specific plans sufficient? That is progress.

Ms. CAMERON. We feel that State development of whole watershed plans is very crucial. Then for individual site plans, we like the idea of very flexible site plans. On the site of existing sources we feel that whether there is a required management measure—that is a more proscriptive management measure from EPA—or whether there is an owner-created site level plan, in either case there does need to be a sense that the plan is backed up by enforcement.

Senator BAUCUS. Thank you very much. I see my time is expiring.

Mr. Grubbs, very briefly, please respond.

Mr. GRUBBS. I have a couple of points here. First, it is important to keep in mind that we are not just talking about agriculture in this conversation, but very broad numbers of different kinds of sources, including retail and commercial establishments, foregoing, and so on.

To us, in the administration, the bottom line is environmental improvement here. We are out to see those problems we have been talking about here today disappear over some reasonable period of time.

Where we are coming from is that we want to make sure that what State programs do, and as we approve them at EPA, that they are truly credible. In my tenure as manager of the non-point source pollution program I have seen quite a number of very good and commendable State and local non-point source pollution programs including the one here that was discussed this morning.

But, frankly, there is a lot of cheap talk in this business. Oftentimes, education programs are very broad proposals put together by State and locals that don't really hold water when you get down to it. So what we are really supporting is the approach of S. 1114, where the States would need to have a credible approach to back up the voluntary means where they fail.

Senator BAUCUS. Thank you.

Thank you, Mr. Chairman.

Senator GRAHAM. Thank you, Senator.

Senator Durenberger?

Senator DURENBERGER. Mr. Chairman, thanks.

I am glad you made the observation that broadens it, but I am also grateful that we talked a lot about farms this morning. In no place around here do we ever do that. I appreciate that, and in particular Mr. McGuire's comments.

You can add to the list of the things we don't do anymore throwing waste out on the gravel roads, and keeping our wells uncapped, and so forth. But I had a variety of these experiences in the last week or two, going around flooded areas.

There are a couple of things I discovered. Despite what we are trying to do in groundwater and things like that, farmers in my State are afraid to cap their wells, because they have to get a permit. Once they apply for the permit, then somebody is going to come out there and find this, this, this, this, and all the rest of that sort of thing.

The reality is that we are like all the rest of these States. We brag up how much we care about the environment, but the reality is the way these programs seem to be implemented, there is a lot of deep concern on the part of farmers, whether it is feed-lot run-off, or it is a guy who told me, "I am afraid to go and ask them for permission. I have a bunch of uncapped wells. I have three of them. I am afraid of the consequences of what might happen."

I also happen to be reading Jane Smiley's "Thousand Acres." For some reason or other, everybody goes to Iowa these days. The President is going, Grassley is there all day today, so he can't vote. Water covers the State. It is sort of an interesting commentary on how people make decisions in agriculture, but it also says something about what Max said earlier about if there is a problem here you have 10,000 decision makers. When you get into the cities, you have hundreds of thousands decision makers.

Minneapolis is drowning, this beautiful city of lakes. The problem is as serious today as it was 20 years ago, when the then mayor decided to appoint a committee to do something about urban run-off. The problem just keeps getting worse.

One of my observations, and maybe one of your reactions I could ask you for, is the role of the States. It has appeared—at least it is my reaction as I go around listening to people—I think things are broken. Comment on this yourself. Are they broke, and not just in a financial sense. I don't think they work very well. I don't why it is.

I hear more concern; I see better qualified people, if you will, as township supervisors, with all due respect, today than ever before. People are into these programs. They are studying them, and they try to understand them. They go to the conferences and all that sort of stuff. They seem to know what they are talking about. The same is true in these small cities.

So if our concern in going to Washington 25 years ago is that the folks are too busy farming and too dumb to understand how to handle their problems, or something that, it ain't the case anymore. Folks seem to be on top of this stuff at the local level.

But between us here, and them, this mechanism that we are proposing in here to make things work better just strikes as isn't working very well anymore. Maybe one of the other could comment

on what are States doing? What is their role? What should we do to reflect reality?

Mr. APPLETON. Well, as head of the water and sewer authority of the jurisdiction that would be the largest State in the Country, and someone who has worked very extensively in nine upstate counties, I think the real problem you have when you talk about enforcement is you are enforcing the wrong things.

That is, enforcement systems are designed to be uniform, predictable, and that they are based, frankly,—and this goes to Senator Chafee's observation—on a model that you build facilities to meet SPDS requirements. That is a very, simple, easy thing to manage. You have a construction schedule. You meet it our you don't. You have water chemistry. You throw it in a tube. They meet it or they don't.

We are now getting into much more complicated, immediate, and difficult decisions. I see this, frankly, as a problem for all the traditional water quality regulators. Indeed, I am concerned that much of what is talked about in water protection is just old wine new bottles. That is, what you have to enforce is an overall environmental strategy, because if you are going to talk about this best management practice, or this management practice, you are going to be right back in two, three, or four years and with the same model that everyone is increasingly unhappy with.

The other thing is, and I come back to this, people are afraid to deal with the land use issue. They are afraid to make individual site-specific decisions.

Our bureaucrats—and I run a 6,500 person bureaucracy that is a regulator, as well as being regulated—get a lot of comfort out of being able to say the same thing about every single situation. But if 80 percent of your environmental problem is coming of 15 percent of your environmental sources, you have to free those regulators, politically, bureaucratically, and financially, to make individual decisions.

As I said in my testimony, what made our deal work is that we were up there to get clean water, not to run a regulatory system. You have to enforce the right things. States and EPA, I think, are going to all have to go through a cultural change. It is almost like re-inventing government, entrepreneurial government, renaissance in government, where we learn to use local initiatives, but we enforce standards, not methods. It is in my testimony. We have a huge enforcement program. We enforce for objectives, not what this bureaucrat or that bureaucrat has decided is today's orthodoxy about technique.

Senator GRAHAM. Anybody else?

Mr. GRUBBS. Yes. I'd like to add something.

Senator GRAHAM. Mr. Grubbs, Mr. Vap, and then Senator Faircloth.

Mr. GRUBBS. OK. Thank you, Senators.

What we are supporting in this Administration is a State-led structure in section 319. We think that was well conceived to begin with. What we are looking for is a stronger, fuller bottom line here to work with.

One thing to keep in mind is that as the Federal Government, not just EPA, but the Forest Service, the Soil Conservation Service,

and others move forward, that movement needs to be in a way in which States can succeed. A lot of what S. 1114 embodies is the notion of technical expectations for non-point sources, which we think are reasonable.

Just to give you an example of the kind of thing we are talking about, consider site development: We would think in terms of expectations for States to plan, and design, and develop sites that would limit increases of impervious surfaces, and limit disturbances of natural drainages, without specifying to the States exactly how. The point is that States and local organizations need to make site-specific decisions; S. 1114 acknowledges that. To us, anyway, this flexibility is a workable structure.

Senator DURENBERGER. Mr. Chairman, if I don't get back from the OSHA hearing, I'd like to leave a question with you the way in which you get the reactions from the locals to the Federal plan. It is the way you integrate all these Federal agencies that are dealing in a particular area.

Mr. VAP. In response to what are States doing with their environmental protection programs that have been handed to them: The State of Nebraska has statutorily given the responsibility for non-point source pollution to the conservation districts. We call them Natural Resources Districts in Nebraska.

They have given us the responsibility for controlling non-point source pollution. They given us the statutory authority to implement programs, and to actually become regulators. We are doing that in many cases.

So some States are out there accepting their responsibilities and doing the job.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. Mr. Vap, you are with the Soil Conservation Service?

Mr. VAP. No, I am with the National Association of Conservation Districts.

Senator FAIRCLOTH. Which represents the Soil Conservation?

Mr. VAP. No. No. We don't represent Soil Conservation Service. We represent the 3,000 Soil and Water Conservation Districts across this Nation.

Senator FAIRCLOTH. OK. The Conservation Districts in every county. Usually they are broken down by counties.

Mr. VAP. Yes.

Senator FAIRCLOTH. All right. Are the soil conservation people into this non-point source pollution question? Isn't that one of their jobs?

Mr. VAP. Very much so. Over the last 40 or 50 years of the existence of soil conservation districts, and the Soil Conservation Service for that matter, it may have started out as an erosion and sediment control program, but basically, if you really look at it, it has been a water quality program for the last 50 years also. Every time you reduce sediment and erosion in the Nation's streams and you reduce the amount of run-off, you are actually protecting the Nation's water quality at the same time.

Senator FAIRCLOTH. Well, that is what I always thought was the purpose of the Soil Conservation, erosion of all types. In fact, it was started in 1934 by Mr. Bennett. Isn't that the man who started it?

Mr. VAP. Hugh Hammond Bennett, yes.

Senator FAIRCLOTH. The Soil Conservation Service was started for erosion and pollution control. Are we talking about somebody to handle this now?

Mr. VAP. This is a point I was hoping I could make. We have the 319 program with EPA. We have had the 1985 and the 1990 Farm Bill, which requires conservation compliance on the part of all farmers in the Nation that receive farm program benefits. We have the coastal zone management program. We have State and local programs for a lot of this type of thing.

We would hope that, whether it is EPA as the lead agency with Soil Conservation Service as the technical provider across the Country, this Committee and the Congress as a whole would take a hard look at how you could integrate all of these programs so that we don't come up with six or seven duplicative sets of paperwork and programs for the cities and farmers across this Nation to comply with.

Let's get it all under one program of some sort so that it will be easy for the landowner, the conservation district, the State agency, and all these people to find out who is going to tell them what they have to do and when, and get these programs together so that we are not in total confusion most of the time as to who is responsible for what.

Senator FAIRCLOTH. Does not Senator Bond have a bill in this direction?

Mr. VAP. I am not sure. I couldn't answer that.

Senator FAIRCLOTH. I thought he did.

I have worked with the Soil Conservation Service for many, many years, and am well aware of what it does and how they do it. They have, like so many of us, been misguided at times. I guess the greatest drainage in this Country, the demolition of wetlands was paid for by the Soil Conservation Service. Canals by the hundreds of miles—I dug them—with drainage of wetlands by the Soil Conservation Service.

But, still it is there. It is functioning. It is in contact with the farmers in most counties. It is associated with the ASC offices, where the money comes from. It looks as if, without creating a new bureaucracy or more people, it would be absolutely simplistic to tie the Soil Conservation Service with the ASC, where the money comes from—the support programs are handled through ASC—and work them together. If you were not getting the cooperation with the Soil Conservation Service in run-off, manure, over-fertilization, or whatever the problem was, then you simply cut off the support payment or whatever might be.

Is that an overly simplistic approach to how to handle it?

Mr. VAP. It may be possibly, but we look at the Soil Conservation Service basically as the provider of technical services and advice to the land operator and farmer out there. They are not just dealing with agriculture these days. They also deal with cities and urban conservation. So they really are the technical provider for non-point source throughout the entire Country.

We would hope that in re-organization of the Department of Agriculture that we don't just throw SCS and ASCS together, so that technical expertise is diluted. We would like to see SCS still remain

the technical provider; ASCS the financial entity for that farm program at least.

Senator FAIRCLOTH. Why would it dilute it if you put it together? I mean are they going to forget how to run an instrument, or why would it dilute it?

Mr. VAP. There has been some talk about cross-training of all employees so that they are experts in handling the financial end of it, and the financial people know how to run a transit, and lay out a set of terraces, and that type of thing, and answer all the questions involved from both entities. That is why we wouldn't like to see them put together.

Senator FAIRCLOTH. That sounds like a bad idea whose time hasn't come.

Mr. VAP. OK.

Senator FAIRCLOTH. Ms. Cameron, there is just one thing.

I noticed that in your paper, you talk about kilograms and hectares. Why? How many farmers do think deal in hectares and kilograms out side of Australia?

Ms. CAMERON. I'm sorry. Which particular part of the testimony? I don't have my copy.

Senator FAIRCLOTH. Here it is.

Ms. CAMERON. Which particular part, if you could just refresh my memory. OK. OK. Hectares.

Very often, in USDA technical reports, and so forth, or of USGS or other kinds of Government reports, we are simply quoting from those government reports here. They use those units.

Senator FAIRCLOTH. Well, that is what I was talking about. They usually write them so nobody can understand them.

[Laughter.]

Ms. CAMERON. Mr. Faircloth, if I could respond to a question you posed to me earlier about do we have farmers in the Natural Resources Defense Council. I do not know of any farmers on our staff, however, I myself have visited several farms over the past year in Maryland, in Ohio, and I have been very impressed with the work that conscientious farmers are doing to protect water quality. Our basic policy on the question of non-point source pollution is that we would like to have the work of these conscientious farmers come to its best effect by having whole watershed programs where their neighbors all start to pull their weight.

Senator FAIRCLOTH. I think you will find that most of the agriculture community in this Nation is conscientious, and very sensitive to the pollution problems, and are working very diligently to handle them and do something about them. From my standpoint, I don't feel that we need any further rules, regulations, or inspections.

Senator GRAHAM. Senator Kempthorne?

Senator KEMPTHORNE. Thank you, Mr. Chairman.

Mr. Olszewski?

Mr. OLSZEWSKI. Pretty good, Senator. Olshefski.

Senator KEMPTHORNE. Olshefski? May I call you Robert?

[Laughter.]

Senator KEMPTHORNE. You may call me Dirk.

Under S. 1114's provisions covering the anti-degradation policies, each State is required to designate, "the outstanding National re-

source waters." The definition in the bill includes waters within, and I quote, "a National park, wildlife refuge, wild and scenic river systems, wilderness areas, National seashores, and lake shores, or National monuments." Then the designation also extends to waters of "exceptional recreational, cultural, or ecological significance," or those that either supporting or are threatened by endangered species, with regard to water systems.

How does this speak to the reach of this provision? Does it also reach waters outside of these designated areas by virtue of the fact that the waters flow through a National forest or wilderness area?

Mr. OLSZEWSKI. We are not sure. We suspect that it is fairly broad based in nature, Senator, from the language you just described. We really don't know what it would mean in terms of implementation when we state in the bill that ONRWs would include any water that supports a population of threatened or endangered species. That could be pretty broad based. Everyone needs to understand what it means when you do have a water designated in an ONRW status. That leads you to have these anti-degradation provisions apply to those waters.

Now, in the past, when ONRWs have been designated, and the EPA regs today, allow for some temporary impacts to occur in ONRWs to the point where we have been able to conduct forestry operations to some extent in ONRWs. The way the language is right now, we don't see that opening for us at all to conduct forestry operations.

Although BMPs are great, and they do a good job, certainly there are certain really intensive storm events, certain events that could have some temporary minor impact on a water body, or water course. We are concerned that the way this section is crafted in the language of the bill right now, it might really restrain any kind of activities from occurring. I am not sure that is the intent, but when we look at the language right now, that is how it looks to us.

In addition, we are not sure how this ONRW designation would impact land outside the public lands you described; upstream, downstream of National forest and of other public lands. Would they be included in the ONRW designations? We are not sure.

Even without that, the potential impacts just as far as the National forest system are concerned could be pretty extensive.

Senator KEMPTHORNE. Yes?

Mr. GRUBBS. I would like to add that at EPA we have some concerns in this area as well, as we testified two weeks ago in a toxics hearing. This is in an area where we think we do need to do some more work to think through the implications of these requirements, and would very much like to continue to work with the subcommittee staff as you move forward on this one.

Senator KEMPTHORNE. Good. I appreciate that.

Mr. Appleton?

Mr. APPLETON. Two things. One, I think we have some concerns about the concept of the ONRWs, that it will not be available for the protection of water sources, particularly an unfiltered water supplies like New York City, that provides water to one out of every 30 Americans. This raises the larger issue of coordination of the Safe Drinking Water Act goals, or the Clean Water Act. The

Clean Water Act administration in the past has not paid enough attention to the implications for drinking water.

The only other concept I would add to the ONRW debate at this point, going back to my testimony, is not every non-point source pollution problem can be dealt with by best management practices. There are some areas where we are going to have to accept the fact that they will need to be left alone. It is one of the reasons the City of New York is committing so much money to land acquisition and core basins around reservoirs and stream corridors in our watershed. If we are going to be serious about non-point source pollution control, we need a full plate. Any degradation should be part of that plate.

Senator KEMPTHORNE. Mr. Chairman, I am about out of time.

One other issue that I wish to just touch on was provisions of this bill substantially expand the use of citizens' suits. I was just interested in any panelist's response as to the merits of this approach in trying to reach enforcement.

Senator GRAHAM. Are there any members of the panel who wish to comment on that?

Mr. McGuire?

Mr. McGUIRE. I am not sure I can comment directly to what you said, but I will just tell you that farmers, and particularly livestock farmers, feel very vulnerable to this kind of a situation. They do because oftentimes the concern of neighbors is focused on something different than water quality, and have decided that either they don't like the looks of the farm; they don't like the smell of the farm; they don't like the noise of the farm; and not having any specific regulations that those three things are violating, they then look for how can he be shut down, or moved, or closed up or whatever, and end up with the water quality standards which are more specific and more available to them for citizens' suits.

So I think it provides a convenience, and a conveyance of them to get into the action to control the problem that they don't like with a law that gives them that opportunity. Farmers feel very vulnerable to that.

Senator KEMPTHORNE. Thank you.

Ms. Cameron?

Ms. CAMERON. I have not analyzed the citizen suit provision of the bill, but I just would like to have your permission to make sure that we do provide comment to the committee, either from my organization, or through one of our fellow members of the Clean Water Network on that particular issue.

Senator KEMPTHORNE. Good.

Senator GRAHAM. I might say, Senator, that we are going to have a separate hearing on the issue of enforcement. It is at that time that we anticipate a major focus on the issue of citizen suits as one of the means of enforcement.

Senator KEMPTHORNE. All right. Good. I will look forward to that. I would welcome your comments, Ms. Cameron.

Ms. CAMERON. Thank you.

Senator KEMPTHORNE. Thank you, Mr. Chairman.

Senator GRAHAM. I'd like to go back to the question that I asked initially, which was does this bill Federalize, that is move to the National level, too many decisions that currently are at the State

level? I would like to pick up on the comment that Mr. Appleton made as illustrative of my concern.

I happen to be a strong believer in land acquisition as a strategic way to deal with non-point source pollution problems. In our State of Florida we have had for many years what is called the Save Our Rivers Program, under which literally thousands of acres have been purchased to provide a natural system buffer for our principal river systems.

This legislation provides a restriction on the amount of the funds that flow to a State which can be used for land acquisition, including the purchase of conservation easements as well as fee-simple titles. I point to that as illustrative of the kinds of additional restrictions that this proposal would impose on States.

I'd like to ask the generic question, what should be the level of Federal proscription in terms of standards, State procedures, State utilization of Federal funds that are made available through this Act? I would like, as the basis of that comment, what our past experience has been? Have States been levels of government in which we cannot rely on a high level of responsibility, and are these additional restrictions therefore required to accomplish the National objective of water quality?

Mr. Grubbs?

MR. GRUBBS. I wasn't sure if you wanted to hear from a Federal bureaucrat on this one.

My view is that we need to recognize successful State programs where they have succeeded. There are quite a number. You don't want to do anything in this process that takes away what States have been able to accomplish.

At the same time, 57 States and territories is a huge land area. There are a lot of differences in those areas in how things move forward. My own experience is that there needs to be more to the Federal role than just providing freedom and Federal funding.

Carol Browner, as you know, formerly headed the environmental agency in Florida, and is fond of talking about the difficulties she had in pollution problems coming from other States across State borders and that she needed Federal support to help her move forward toward more uniform programs to deal with those kinds of problems. That is one example that you might think about.

The trick on this is going to be, as we move forward, not at the State level, but at the county, the conservation district, and the local level, to make sure that you don't take anything away from the successes and the commitment of people trying to succeed voluntarily because it is the right to do. Rather, what you are doing is you are firming up your bottom lines. You are taking care of the places where the system has failed. I think that is what EPA can and has added.

MR. APPLETON. Senator, may I add to that?

It makes me nervous when I hear in Mr. Grubbs' and others' language the imposition of standard technological bases. I want to caution this committee against what is a reculturalization that all of us who are in the clean water business have to go through. What is important about S. 1114 is that in its watershed provisions it is trying to grapple with the issue of what are the appropriate institutional arrangements for the future.

What I would be concerned with is Federalizing, essentially, a non-point source approach that is based on essentially NPDES-type administration and technological standards that are uniformly required. The right Federal role is very tough goals. The right Federal role is funding support, including for land acquisition. We have not discussed research here, but there is an enormous need in these billions-of-dollars decisions to have them guided by the right research. The right Federal role is in interstate areas and harbors, like those shared with New York and New Jersey, and intervening when it is clear that is the only other choice.

States have experienced a similar weaning from top down management of these areas. We go back to our experience with Dick. It was the farmers who came to us, not we who came to the farmers. That is not possible, or at least it would be very difficult without an enlightened governor, under the current S. 1114 watershed approach. Those enlightened farmers, those enlightened forest companies are going to have a very difficult time making their case in this system that still flows top down.

I think it is less a question of Federal and State, as it is of what we ask them to do. Are we going to be entrepreneurial about this? Are we going to gamble on being successful? Are we going to have the measured approach Senator Baucus was talking about? Or are we going to recreate SPDES for the non-point source area? It seems to me that is the critical issue we have to discuss here.

Senator GRAHAM. Yes, Mr. McGuire?

Mr. MCGUIRE. Because of my background, I may get more basic in the approach here than I do technical, but so be it.

Let me say that this whole discussion boils down to money. Mandates on the Federal level, State level down to the county localities—who is going to pay for it?

I do not think that anything ought to be used to avoid the issue. On the other hand, I perceive that we are in grave danger of first misidentifying the problem, and then misidentifying the solution to it. History has said we have spent a tremendous amount of money by governments of all levels and not accomplished anything.

As far as the purchase of land—we have a lot of discussion in New York State about protecting land either by buying development rights—we have a long history of it on Long Island—or by buying land for protection of water supplies, buying land for scenic beauty. The problem always boils down to who appropriates the money, and is it in the public interest, and does it accomplish what we are after?

I am confident that in the land purchases around the reservoirs in the Catskills this is an appropriate expenditure, particularly because of the development in those areas. I am not sure that appropriations of money at any level of government that take land out of production, to land out of private use, to take land off the tax rolls, is an appropriate expenditure of public money, unless it is absolutely verified as to what it accomplishes whether it is pollution or something else, whether it accomplishes the purpose.

So in that whole area of mandates, it comes to the forefront that we have budget problems in New York State. Historically in the last decade our legislature has passed laws that say, we haven't got

any money to pay for it, but we are going to have the counties pay for it. The Federal Government does the same thing.

The senator who isn't here now is absolutely right. The whole system is broke, because we have spent money on things that did not accomplish the purpose that they were intended for, maybe because of misidentification of the problem in the beginning. I think that this is a very appropriate discussion by your committee in this area on non-point source pollution, because it is not as identifiable as point source pollution is.

It is a gray area all the way through. I think that is why we have to have people involved such as this approach we have made in New York State. Those closest to the problems are going to come up with the best solutions. They even may make mistakes, but I think we will have minimized the problem.

Senator GRAHAM. My time is up.

Mr. Grubbs, if you would like to make a final comment, then Senator Baucus will take a turn.

Mr. GRUBBS. Thank you.

I just want to try to correct one misimpression that may be left here at the table. That is that neither I, nor anybody at EPA, is advocating a State permit, NPDES-style program for controlling non-point source pollution. That is not what we are talking about here. We are talking about much broader guidance, a lot of flexibility for States to adopt it, backed by funding. Specifically, we do support watershed approaches with a lot of freedom that States and local areas can concoct to achieve water quality. I don't think the analogy to a State permit program is correct.

Senator GRAHAM. Senator Baucus?

Senator BAUCUS. Thank you, Mr. Chairman.

Mr. McGuire, does this bill misidentify the non-point source pollution problem? Does it identify correctly or incorrectly in your view?

Mr. MCGUIRE. In its breadth, it obviously misidentifies some problems.

Senator BAUCUS. First of all, what does identify correctly, and what in your view does it identify incorrectly? That is the bottom line.

Mr. MCGUIRE. For example, in almost any pollution problem or residue problem or any thing else, it is very easy to attack the major obvious positions. I think it has already been said that the point source pollution things did that.

Senator BAUCUS. We are not talking about point source. We are talking about non-point now.

Mr. MCGUIRE. In this one it is going to be extremely difficult, and not advisable on a risk-management basis, to control all of it. I think that voluntary compliance and the best practice management is going to control more than regulation.

Senator BAUCUS. There are some who say this bill doesn't go far enough because it doesn't control all of it. We have some witnesses here who would make that point.

Mr. MCGUIRE. Who is ready to pay for that?

Senator BAUCUS. So we are attempting to get a balance here, to some degree, not entirely, but to some degree, between those who think it doesn't and should control all of it, and those who think

that maybe we shouldn't control very much of it. That is why I asked the question whether the approach in this bill is in your view correct.

Mr. McGUIRE. Senator, excessive controls without the money to carry them out is not in the public interest. As I said, perhaps before you arrived, we have less than two million volunteers out here producing food. Voluntarily they will decide not to, if the excessive cost puts them out of business, or the excessive regulations. I don't think that they are going to be able to keep up.

Senator BAUCUS. This is to Mr. Vap, and also you, Mr. McGuire. Some claim that the conservation compliance plans are insufficient. That is they control only run-off and soil erosion and not other water quality matters. Your response?

As you know the bill provides conservation compliance plans in some instances a sufficient. That is, in waters that it identifies as impaired, an operator who has a conservation compliance plan, then he has complied. Others though, say that is only part of the problem. It is insufficient. Your response?

Mr. VAP. That could be partially true. When we look at, for example, nitrate contamination of either surface or groundwater, the easiest place to control the application of nitrate fertilizer is controlling the amount the farmer puts on. But a good thunder storm will produce more nitrogen than most farmers put on in a year.

Mother Nature provides a lot of nitrogen through the decaying vegetation. In many areas of the country there are natural nitrate levels underground that have been there for centuries, and they also degrade.

So the compliance plans may not necessarily control all of that type of degradation.

Senator BAUCUS. My question, though, is should the requirement in the bill go beyond conservation compliance plans, or not?

Mr. VAP. On a site-specific basis?

Senator BAUCUS. Yes, site-specific.

Mr. VAP. Yes.

Senator BAUCUS. What would you add? How would go about adding for that?

Mr. VAP. Well, you are looking at non-point source pollution.

Senator BAUCUS. Yes, non-point source pollution.

Mr. VAP. Are you strictly looking at the farm community?

Senator BAUCUS. Looking at an operator who is on a stream identified as impaired. He has his conservation compliance plan, but I am asking you should that be sufficient, or should that plan also go beyond that, because that is addressing essentially solid erosion.

Mr. VAP. If we are looking at soil erosion, and that compliance plan is working the way it is supposed to, then I don't think you need to go any further. But if that stream runs through a city, are you going to totally blame the farmer for degradation of that stream?

Senator BAUCUS. So you are thinking if it is living up to the terms of the plan, that should do it.

Mr. VAP. I think so, if he is controlling the run-off off of his land with a good solid conservation compliance plan, I think that is sufficient.

Senator BAUCUS. What is your response to those who say that it doesn't address other water quality matters?

Mr. VAP. What are the other water quality matters?

Senator BAUCUS. It isn't just soil erosion. Let's say it gets into nitrates, which is a non-erosion issue.

Mr. VAP. It is to a certain extent.

Mr. MCGUIRE. Nutrients don't leave the soil unless they attach to particles that leave with it.

Mr. VAP. That is right.

Senator BAUCUS. OK.

Mr. VAP. You have to have run-off to degradate a stream with nitrates. That doesn't mean that nitrates can't get into the ground-water supply.

Senator BAUCUS. I'm asking Ms. Cameron that, because I am sure she has a little different view.

Ms. CAMERON. Yes. In our view, the conservation compliance plans are useful, and we have a conditional support for the provision in S. 1114. That is we believe that giving exception to farmers who have a conservation compliance plan is a good idea to the extent that sediment erosion is the problem in the watershed. As you were alluding to, Senator, there are other potential problems, or existing problems in many watersheds.

We believe that on a watershed, or at least on a water segment limited basis, although we believe that the proper management unit is the whole watershed, the process should begin with identifying the problems. The problems are, for example, nitrate contamination of groundwater, and if the States and the local authorities have identified farming management of manure as one of the significant nitrate sources, then that there needs to be more done than the conservation compliance plan.

Perhaps that plan could be the basis for revision. In other words, perhaps that plan could be the vehicle for a conservation district person, or a State person, to help the farmer come up with an additional component to address that manure management issue, or the fertilizer use issue.

Senator BAUCUS. I appreciate that. My time has expired.

I just think it is important in this entire discussion, as we are attempting to achieve perfection. That is a conservation compliance plan satisfaction might be perfect, but I think it is good.

Mr. MCGUIRE. Senator, I think your balanced approach is good.

Senator BAUCUS. What we are trying to do here is trying to find something that is very, very good, moving as close as we can to perfection, but still getting something passed that does advance the ball substantially forward.

Again, we must remember that sometimes the cause of perfection is the enemy of the good. We can't all have everything at once.

Ms. CAMERON. If I may respond that we realize that this is a long journey that we just now really beginning, with the Senate bill, and also with the Oberstar bill, that we are supporting on the House side, H.R. 2543. In both cases, we are contemplating very long time-frames on the order of close to a decade, or more than a decade for the undertaking of the plans.

Senator BAUCUS. Thank you.

Thank you, Mr. Chairman.

Senator GRAHAM. Senator Chafee?

Senator CHAFEE. No questions. I think the part of Mr. Appleton's statement, where he goes through these three points are worthwhile for us to bear in mind.

We have some other witnesses coming up I look forward to seeing and hearing from.

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. I just have one brief question.

Mr. Vap, isn't a comprehensive soil conservation plan required for every farm now coming up in 1992 or sometime very quickly to continue in ASC programs? Don't you have to have one?

Mr. VAP. That is the basis of the conservation compliance plans, that by 1995 they are to have that plan up and running and working properly to be eligible for any farm benefits, not just ASCS, that is also FMHA.

Senator FAIRCLOTH. What is FMHA?

Mr. VAP. The Farmer's Home Administration loans.

That also keeps them eligible for Federal Crop Insurance and programs of that type. If they don't comply they can be totally put out of all farm programs and benefits.

Senator FAIRCLOTH. That is what I thought, that we had this coming up. That sounds to me like a pretty tight rein on run-off and other things. As for the amount of nitrogen a farmer puts on his land, I don't how we could ever control that.

Mr. VAP. We are doing it on a local basis.

Senator FAIRCLOTH. How do you do it?

Mr. VAP. Our district has statutory authority to do that.

Right now in our district they have to report to our local district the amount of nitrate that is being put on there.

Senator FAIRCLOTH. It is an honor situation.

Mr. VAP. It is basically an honor situation in the beginning, yes.

Senator FAIRCLOTH. Mr. McGuire, you are talking about the nitrogen in the water, and we talk about run-off, but the difference between the amount of absorption of land, the ability of it to leach nitrogen is just astronomically different from Sulfur County, in Riverhead, Long Island to the clay of Dutchess County.

Mr. MCGUIRE. The same difference in crops being raised out here.

Mr. APPLETON. If I could also make one point where a watershed approach could really be helpful here. We really need to look at nitrogen loading as a totality. In the watershed, phosphorus is actually the nutrient of concern for us.

Then start looking at where you can take nitrogen loading out, or phosphorus loading out, of the waste stream in the most cost effective fashion. One of the concerns, again, I have is that if you just apply these standards source by source, and you are taking an overall approach, you will not get to the question of where is it most cost-effective for us as regulators and managers to intervene.

In our Cannonsville Reservoir, which is our most phosphorus stressed, we have set up a task force of State agencies and the local community to look at where we can get phosphorus reductions in the most cost effective and most locally acceptable way. We are already at the eutrophication limit.

By creating an overall watershed phosphorus plan we can then reduce phosphorus below the loading limits. Then we don't have to be Draconian in a way that treats each farm or each source in isolation.

Senator FAIRCLOTH. Thank you.

Senator GRAHAM. Thank you very much, Senator.

Thank you members of this panel for a very excellent and insightful discussion.

Incidentally, there may be some questions that members of the subcommittee would like to submit subsequent to this hearing. We would appreciate your consideration and response. Those responses will also be incorporated as part of the record.

Mr. APPLETON. Also, Senator, if I might? We would like to submit comments on the watershed hearing. We believe, in our experience, that some testimony directed toward that might be helpful.

Senator GRAHAM. We would be very pleased to receive that.

If the members of the second panel would please come forward, I will introduce them.

Mr. Willard De Golyer, dairy farmer from Wyoming County, New York; and Dr. Stanley Weeks, Director of Farm Systems Research Product and Development, of Syracuse, New York; both representing the National Council of Farm Cooperatives.

Ms. Judy Olson, Vice President of the National Association of Wheat Growers, from Garfield, Washington.

Mr. Paul Genho, Chairman of the Private Lands and Environmental Management Committee, representing the National Cattlemen's Association.

Mr. L. Scott Tucker, Chairman of the Stormwater Committee, National Association of Flood and Stormwater Management Agencies.

Mr. Robert Warrick, a farmer from Nebraska, who is chairman of the Sierra Club Committee on Agriculture, affiliated with the Sustainable Agriculture Working Group was not able to be with us today. I would like to ask Ms. Cameron if she would join this panel as well, in order to respond to any questions from the aspect of the environmental community.

Ladies and gentlemen, we are going to have to conclude this hearing in 55 minutes, at 1:00 p.m. I would like to call on you for an opening statement. We would like both comprehensiveness and brevity, so that we can move on to the questions.

First, Mr. William De Golyer and Dr. Weeks.

STATEMENT OF WILLARD De GOLYER, DAIRY FARMER, NATIONAL COUNCIL OF FARMER COOPERATIVES

Mr. DE GOLYER. Thank you, Mr. Chairman and members of the subcommittee.

My name is Willard De Golyer, and I am a third generation dairy farmer on Table Rock Farm. The fourth generation, my daughter Megan, is sitting behind me.

Senator CHAFFEE. Where's Megan? Let's see her.

Mr. DE GOLYER. My uncle and I, and our families, have a milking herd of 650 cows, and plant 800 acres of corn and alfalfa on our

farm located south of Rochester, New York. I'll pass around a copy of my farm's mission statement.

I am an active member of Agway, our regional farm cooperative. Agway, which is headquartered in Syracuse, New York, is owned by 91,000 farmer members in 12 northeastern States. I frequently turn to my cooperative for information and technical assistance on environmental concerns.

Accompanying me is Dr. Stanley Weeks, who is director of Agway's farm research systems and product development. Dr. Weeks is an internationally recognized expert in the science of manure management, not a glamorous topic, but one critical to making water quality progress. Among his many notable contributions is development of a biogas system approach to dairy manure management.

We pleased to testify today on behalf of the National Council of Farmer Cooperatives, which represents farmer-owned cooperatives across the United States, and to share our views on the reauthorization of the Federal Water Pollution Control Act.

Farmers and their cooperatives have a great deal at stake in the water quality policy debate. We are committed to playing a positive role in the search for effective solutions. I would like to submit our prepared statement for the record, and then touch on a few points.

First, successful policies will achieve management of non-point source pollution from agriculture, while at the same time allowing farmers to stay in business. Second, I keep hearing this talk about bad actors, while the farmers I know are generally trying to be good actors. Our families, animals, and farms are among the first to be affected by poor water quality. We work to use the best management techniques to ensure good water for everyone.

Third, we are going to need help in getting there. Farmers' basic needs include sound information on what works; technical assistance; and finance assistance to achieve site-specific best management practices. We get this kind of help from people like Stan. We also rely on the Land Grant universities for information. However, funds for this type of non-profit based research have been drying up.

S. 1114 goes a long way in responding to the special needs and concerns of American agriculture. It seeks to establish a good actor partnership between agriculture and government in targeting impaired watersheds, and it places states in a lead planning and implementing role. Farmers would be given the flexibility to implement site-specific best management practices.

The bill also gives credit to farmers if they have a conservation compliance plan. Additional requirements will not be imposed on Farmers where the water supplies meet water quality standards.

In general, we believe S. 1114 is a good foundation on which the subcommittee can build toward final legislation, allowing farmers like me to work with experts like Dr. Weeks to get the job done.

Now, as we stated in the written testimony, we do have a few concerns and suggestions to improve S. 1114. These include increased funding, allow time for voluntary programs to work before conducting evaluations, link agricultural accountability to performance on part of states and funding levels, ensure flex guidelines in Section 304 programs, make sure biological monitoring refines and

does not increase existing water quality standards, and allow Soil Conservation Service to be the lead Federal agency in dealing with agriculture in this area.

I'd like to emphasize one point particularly. If you are looking for reinforcements to help get this job done, cooperatives like Agway are uniquely positioned to be part of that solution. Cooperatives work in partnership with farmers and ranchers who are their member-owners, as they strive to address non-point source pollution and other environmental challenges.

We in the Agway system are particularly excited about advances in animal manure management at our research facility. I hope Dr. Weeks will have the opportunity to offer some highlights during discussion.

Cooperatives by definition are self-help organizations. Today four out five farmers belong to one or more cooperatives. In the search for water quality solutions, we hope you will look for ways of bringing the cooperative community in as part of the solution.

Senator GRAHAM. Dr. Weeks?

STATEMENT OF STANLEY WEEKS, DIRECTOR, FARM RESEARCH SYSTEMS AND PRODUCT DEVELOPMENT, AGWAY, INC., SYRACUSE, NEW YORK

Dr. WEEKS. Thank you, Senator Graham and members of the subcommittee.

Just briefly, let me talk for a few minutes about our friend, the dairy cow. Our research farm, located in Central New York, is actually a cooperative research farm. The animal nutrition work that goes on at that research farm is supported by 12 farmer-owner cooperatives in the U.S., Canada, and one in France. That information is shared with the other 11 cooperatives.

We milk 250 cows a day there. So we are a real farm, and we test equipment systems prior to sales to our farmer members.

Our approach to manure management is a systems approach. It clearly is a major materials handling issue. Let me briefly describe our approach.

First of all, we recognize that manure is a resource worth about \$100 per dairy cow per year as a fertilizer source. So let's begin with the cow.

Our cows lie on mattresses. They are stuffed either with sawdust or shredded rubber. That gives the cow comfort, and that reduces the amount of bedding required to be purchased.

We use automatic scrapper systems to remove manure from the barn. That gives us clean cows to be milked, and it is a very energy efficient system.

We use liquid-solid separators. They are German-made units. The Europeans are a little bit ahead of us in these environmental concerns. This German-made unit separates the manure fibers from the liquid.

We compost the solids, all those solid fibers for bedding. We can use it as a soil amendment product. It is also a potential cash crop from the dairy operation.

The separated liquid then goes to a long-term liquid storage. That is our fertilizer source. That can be remote from the barns

and central to the fields. That reduces transportation time and cost, and we like to have a six-month storage in our part of the Country, so that we don't have to spread on frozen land. We can spread in the Spring and Fall, and incorporate especially to save the majority of the nitrogen portion of that fertilizer.

Since 1981 we have operated an anaerobic digester, our information for building that digester came from three Land Grant universities; Cornell University, Penn State, and the University of Missouri.

That is an odor control system, basically, but it also is an energy production system. We know how many kilowatt hours each dairy cow will produce, as well as how she will eat, and how much milk she will produce. It is probably the most effective method of odor control. A lot of our neighbors equate odor with pollution. So that is one of the major reasons that we work with digesters. It also produces methane from that manure, which we then utilize so we burn the methane instead of letting it go in the air. The overall systems economics still need to be evaluated farm by farm;

In the end result, proper land application is the key for adequate manure handling. In our area, the Soil Conservation Service and Land Grant colleges are very important allies in designing and in providing information on manure handling systems. I would strongly encourage more support for both of those organizations.

To summarize, animal manure is an important fertilizer resource, but we must store and apply it properly.

Senator GRAHAM. Thank you very much, Doctor.

Ms. Olson?

STATEMENT OF JUDY OLSON, VICE-PRESIDENT, NATIONAL ASSOCIATION OF WHEAT GROWERS, GARFIELD, WASHINGTON

Ms. OLSON. Thank you.

I am a wheat farmer from Garfield, Washington, as you said in my introduction. My husband and I farm there, have for the past 20 years. I am speaking today on behalf of five additional commodity groups. I appreciate the opportunity to comment on the non-point source title of S. 1114.

We are pleased that the legislation emphasizes the importance of watershed planning, local ownership of watershed projects, and the site-specific approach, which we think is very, very important. But, this philosophy must be made practical from a farmer's point of view, if we are going to make substantial improvements in the quality of our natural resource.

They must also include realistic time-frames. One of the points that I make in my written testimony and I would like to highlight is the fact that voluntary programs do work within agriculture. We have had many comments today on many examples. There are four additional examples in my written testimony about how voluntary programs are implemented on farms by farmers.

A big component of voluntary programs by farmers on farms has to do with technical assistance, education, and research. I feel very strongly, as do the groups that I represent, that farmers when they are aware of a problem in their local area, watershed in this in-

stance, buy into that, or accept local ownership of problems. They are problem solvers inherently.

So we need education to identify the problems. We need technical assistance and research to identify cost-effective, workable solutions within the region that has a problem and to address those problems. That is where technical assistance fits in to the voluntary component. Those things go together very, very closely.

After we have the technical assistance, the research, the education, then we need some additional assistance, or education, to make that transfer back to the farmers through demonstration projects. We have cooperative extension service; we have local soil conservation districts; both play a very important role in that technology transfer back to the individual farmers.

It has been my experience in my own county that most farmers, once they see a better way to do something, they readily adopt the new practice. I live in a very highly erodible county I farm in the Palouse region where virtually every acre is classified as HEL. We have been working for probably 40 years to reduce erosion of those highly productive soils. Farmers voluntarily have done that because it is in their own best interest. We continue to adopt new technologies. This is an on-going process; it is not something that you can say; "This is the answer". It is an on-going process as we become more familiar with the causes, the effects, and new equipment and techniques are developed.

The other point I'd like to make is that we believe very strongly in local solutions to local problems. Water quality is a local problem, especially where non-point sources occur. We believe that the stake-holders in that watershed have a vested interest in protecting the quality of those waters and improving it, and will be voluntarily involved in that solution, given an opportunity to do so.

We believe that the solution should come, basically, from the bottom up.

Realistically, farming cannot be done by a National environmental protection agency handling it. We have learned some very valuable lessons with conservation compliance in the 1990 Farm Bill. Many of those lessons were good. Some of those should be a guidance to this committee as to what works effectively, and where some things could be improved.

One-size-fits-all does not apply to agriculture. We have different soils throughout the Country. We have different weather conditions, climatic conditions, and different needs. The local unit, again, is best able to identify the needs and the most effective practices. Therefore, we feel that EPA guidance on this matter is probably very inappropriate.

We also believe that five years is not long enough to have the value and the merit of the conservation plans, which actually are coming into effect but aren't required to be into effect until 1995, to be thoroughly analyzed, evaluated, and the results known. We would like to commend the committee for drawing the correlation between conservation compliance plans and water quality. We think that will be a valuable tool to help us address water quality, but we feel that those plans need a little longer to work, that the results need to be made known to farmers before they are required to add additional management practices.

With that, Mr. Chairman, I would like to thank you for your consideration, and would welcome any questions at the appropriate time.

Senator GRAHAM. Very good. Thank you, Ms. Olson.
Mr. Genho?

STATEMENT OF PAUL GENHO, CHAIRMAN, PRIVATE LANDS AND ENVIRONMENTAL MANAGEMENT COMMITTEE, NATIONAL CATTLEMEN'S ASSOCIATION

Mr. GENHO. My name is Paul Genho. I am a rancher from Florida, and also chairman of the Private Lands and Environmental Management Committee of the National Cattlemen's Association.

The National Cattlemen's Association is the voice of cattle producers nationwide. We represent 230,000 cattle producers across the Country through 76 affiliated organizations.

We appreciate very much the leadership shown by Senator Baucus and Senator Chafee in introducing S. 1114, as well as your leadership, Senator Graham, in these hearings.

We have reviewed this legislation and have submitted extensive comments on S. 1114. We would welcome the opportunity to continue working with the committee to refine S. 1114.

During our review we found a number of provisions which we especially support. I'd like to focus my comments on these four areas that we feel are excellent. We would like to voice our support for them.

The first area is that we support increased efforts to ascertain the water quality by testing of all waters in the United States. We think this is one of the most important provisions of S. 1114. Testing will provide the road map necessary for protection of America's waters by identifying specific sites with genuine non-point source pollution problems. This will avoid needless Federal, State, and private expenditures of funds spent in an effort to solve nonexistent problems.

If I could, in a personal note by way of an illustration: In 1979, a State environmental regulatory agency filed legal proceedings against our ranch after a fish kill in a river that is close to us, alleging that we were pumping storm water discharges which, among other things, violated the following water quality standards: DO levels (dissolved oxygen levels), biological oxygen demand levels, turbidity, phosphorus levels, conductivity, chlorides; and suggested a number of other problems, including a statement that nutrient enrichment, because of the activity of cattle, occurred. All the allegations were supported by pages of expert witnesses, the majority of which were regulators from various agencies.

Subsequent to this, after 10 years of testing of our water discharges, versus an individual operation, and five years in combination with State agencies and other producers, it has been clearly documented that we had virtually no biological oxygen demand problems, no nitrogen problems, no phosphorus problems, no conductivity, no turbidity, no chlorides, no sulfate, or no pesticide violations. There were hundreds of tests.

While occasional problems of dissolved oxygen levels do occur in our discharge, the incidents and scopes of these violations are

much lower than suggested by the allegations. In addition, it was found that DO levels and discharges from the ranch were very frequently superior to those found in the naturally occurring receiving water. As a result of recognizing the impossibility of obtaining the State's standard, application for a site-specific alternative criteria seeking a lower DO level standard has been applied for by the regulatory agency.

Extensive long-range testing that accurately ascertain water quality problems will provide a scientific basis which will allow us to target real non-point source pollution problems, rather than to respond to every false allegation, faulty conclusion, and pseudo-scientific assumption.

Point two: We also support the provision of S. 1114 which targets water bodies with a demonstrated water quality impairment. Existing Federal budgetary constraints, and just plain good sense, require that limited that limited resources be directed toward those areas with real water quality impairment. Successful programs must include locally crafted and cost-effective solutions.

Point three: Additionally, we support voluntary site-specific plans for landowners which recognize current, on-going State and locally developed water quality programs across the Country. We also urge you to recognize the ability of landowners to craft viable solutions to demonstrated water quality problems. Positive incentives to improve water quality should be implemented.

Again, by way of illustration, when I became aware of the reality of the low dissolved oxygen levels in both our discharge and in the whole river system, I approached the agency to discuss the possibility of building retention ponds to provide treatment. I had been informed that such treatment if properly designed would raise dissolved oxygen levels by one part per million. As a result, we have completed two such treatment systems on our ranch at considerable financial expense to ourselves. Two more systems are in the process of being constructed, and several more are designed and are permitted.

In addition to the large expense required of us to engineer, permit, and construct these facilities, we have also dedicated considerable acreage for the treatment ponds. We will lose all productive use of this acreage. The largest of these ponds will be 505 acres. I want to emphasize that this was a voluntary action on our part.

The State obtained treated water, and will obtain much scientific information through our on-going monitoring program. We obtain the presumption of compliance with the State water quality standards, some dry season irrigation benefit, wetland mitigation credit because of the wetlands we created, and some public goodwill.

The project was voluntary. It helped to solve a problem, and it carries with it some non-cash incentives.

Cattle producers are willing and able to make management decisions which will protect water quality. NCA is involved currently in research to determine and ascertain the level of involvement in a number of States across the Country. When this study is completed, we will be pleased to provide you with copies of it.

Cattle producers are going to be a key component to water quality protection efforts. We are a major land use throughout the

Nation. We have the interest; we have the desire to improve water quality.

Senator, I will conclude my remarks with that, and once again expressing appreciation for the opportunity to be here to participate in this hearing.

Senator GRAHAM. Thank you very much, Mr. Genho.

I'd like to say I have been trying to encourage some of my colleagues to spend some time seeing some of the situations in Florida. I'd like to add your ranch as one of the places for visiting if we could do that.

Mr. GENHO. I'd be glad to do that.

Senator GRAHAM. Thank you.

Mr. Tucker?

STATEMENT OF L. SCOTT TUCKER, CHAIRMAN, STORMWATER COMMITTEE, NATIONAL ASSOCIATION OF FLOOD AND STORMWATER MANAGEMENT AGENCIES

Mr. TUCKER. Thank you, Mr. Chairman and members of the committee.

I'll admit up-front I am not a farmer. I am the executive director of the Urban Drainage and Flood Control District of the Denver, Colorado, metropolitan area. The District is a multi-county agency that covers six counties and 30 municipalities.

Today I am appearing on behalf of the National Association of Flood and Stormwater Management Agencies. We call it NASMA. We appreciate the opportunity to present our views to the committee on the stormwater management section of S. 1114. That is Section 402.

It is appropriate, I think, that urban stormwater is in fact a non-point source, and so it does fit with this discussion. Mr. Chairman, we believe that S. 1114 establishes an excellent framework for new amendments to a Clean Water Act dealing with municipal stormwater systems.

Pursuant to the Water Quality Act of 1987, some 200 of the larger cities and counties submitted their applications for NPDS permits for their stormwater systems. Despite considerable uncertainty and local resource constraints, the commitment of local resources to respond to this mandate has been significant.

By NASMA's estimate, these 200 cities and counties have spent over \$130 million just to prepare applications. For example, it costs over \$2 million to prepare simple applications for Denver, Aurora, and Lakewood, Colorado; which included the pooling of our efforts to reduce costs.

Preliminary results from a survey now being conducted by NASMA indicates that many of the 200 cities and counties are projecting to spend over 10 times the amount they spent on their applications during the first five year permit period. We are in the NPDS program now, I might add.

The programs that municipalities must develop to control pollutants in stormwater will be new programs. Unfortunately, to a large extent, we do not know how to predict their performance or effectiveness on receiving waters. In short, the Nation's larger cities and counties are not embarking on a large demonstration program.

We bring this to your attention to assure you that a considerable effort has been made, and will continue to be made to reduce pollutants in stormwater in spite of some doubts and concerns that have been expressed.

Mr. Chairman, in reviewing of S. 1114 within the context of NASMA's principal issues, we find it addresses most of our concerns. Our most critical issue is clarification of the use of water quality standards and objectives as applied to municipal stormwater. In reality there are fundamental differences between municipal stormwater and traditional waste water in industrial effluent point sources.

Consequently, water quality base limits, including numerical and pipe limits, should not be used in the municipal stormwater permit program to measure permit compliance. S. 1114 addresses this major concern by placing a 10-year moratorium on the use of numerical effluent limits for compliance purposes.

However, it is essential that this 10-year period be used to advance the urban stormwater science to enable the development of appropriate standards for wet weather conditions. This is imperative lest we find ourselves 10 years from now in the same position we are today.

We support the bill's provision to clarify the meaning of maximum extent practicable. A CZMA guidance document is a valid place to start, but it was developed for use in coastal areas. NASMA recommends that provisions be included to review and revise the CZMA guidance as necessary to achieve an acceptable degree of Nation-wide applicability.

S. 1114 recognizes the fact that municipal stormwater systems convey, not create, pollutants that are generated by many widely dispersed sources. As such, municipal systems are more like non-point than traditional point sources. The bill's provision to consider the reduction in use of pollutants that are found to be significant contributors to water quality impairment is a sound and wise response to this problem.

If there are any questions, I would be happy to respond. Our full statement has been submitted.

Senator GRAHAM. Thank you very much, Mr. Tucker.

As with the first panel, the full statements of each panelist will be included in the record.

Ms. Cameron, do you have any additional opening statements for the Panel II?

Ms. CAMERON. In a way, I guess I am a stand-in for Mr. Warrick, who is chairman of the Sierra Club Agriculture Committee, and a Nebraska farmer. If I may, I would like to read a brief selection from Mr. Warrick's testimony, because it further underscores our own view on the issue.

In general, Mr. Warrick supports title III of S. 1114 as an effective first step toward meeting water quality goals for non-point programming. Mr. Warrick goes on to state that,

However, my experience in sharing a county soil and water conservation board and a natural resources district tells me that the success of any watershed polluted run-off program would be determined by how effectively site-level plans are implemented throughout the watershed. My experience as a farmer suggests that land owner cooperation in implementing site-level plans can only be obtained where there is the perception that mandated management measures were determined as

the result of a fair process, uniformly applied to all land owners in the watershed, and based on problems identified by application of specific objective criteria.

I believe he is talking there primarily about objective water quality criteria in the stream that gives farmers a target to shoot for when they are designing their flexible plans.

I therefore urge that any non-point pollution program ultimately enacted include the following components: A watershed based comprehensive approach that protects surface water, ground water, wetlands, lakes, and all land uses; a process to determine what pollution sources in an impaired watershed are most critical to water quality improvement; mandatory site-level planned development and management level implementation for targeted pollution sources; management measures based on specific water quality objectives and criteria to protect human, fish, and wildlife health; comprehensive training for all government officials involved in site-level planning or in providing technical assistance in the implementation of management measures; and a unified approach that builds on and incorporates existing conservation and water quality plans from the Food Security Act and other laws.

Thank you.

Senator GRAHAM. We have had since 1972 a Clean Water Act, and for the last five, almost six years a specific Federal commitment to non-point source pollution control. I would be interested in your diagnosis of what has happened in the past, in terms of the Federal efforts at non-point source pollution control. What is your diagnosis of the current Federal efforts, and from that, what do you think should be our priorities, particularly as it relates to agriculture for this re-authorization?

Mr. Genho?

Mr. GENHO. Yes. I mentioned the 1972 enactment of the Clean Water Act. I grew up on the St. Johns River. I recall well the industrial waste and raw sewerage in that river during my childhood and early adulthood, and recognize the real progress that has been made in the point source problems, just from sitting there and watching that river over these years.

I think non-point source has had less of an emphasis, and less of something that we have all focused on, and as was mentioned earlier, years ago we were all told that the solution to pollution was dilution. In agriculture, it was to spread everything out, and then there was no need in worrying about it. But that consciousness has changed rapidly, both on the State and Federal level and in the regulatory agencies, and those managers of the farms of this Nation.

In 1987, as I understand it, there was created the amendments which began the section 319 program and limited funding. The first money from that was allocated, I believe, in 1989. So in some cases it was a year and a half later before it actually began to hit the ground, which would put it in the mid-1990's. So we really have started this voluntary program to move forward. I think the consciousness is being raised out in the country.

I don't think at this time we can say there has been a horrendous amount of change, because there hasn't been the time. Biological things take time to change. We are really looking at two years or so of programs that have been funded. Obviously, the funding has been grossly inadequate. In order to have the kinds of programs we need we are going to need more funds.

We also, right now, have a lot of information that may or may not be valid, and that we are trying to make conclusions from. The testing program, I know, is extremely critical. We must have a

solid baseline of good information so we can target these real problems, then spend private, Federal and State money to clean them up. We know there are non-point source pollution problems; and we know agriculture contributes to it. Agriculture wants to be part of the solution.

We need to continue in the general area that we have been going in, refined by the additional funding.

Senator GRAHAM. Do you have a comment, Ms. Olson?

Ms. OLSON. Yes. I would to add a couple of comments that I agree with Mr. Genho in general that non-point source pollution, especially for agriculture, has been a secondary thought in the first 20 years of Clean Water, primarily because the focus has been on point sources.

However, from my own personal experience, I would not say that non-point source pollution from agriculture has gone totally overlooked in the area of the Country that I come from. We have designed at our county level best management practices for water quality. Those were designed by our local county extension agent, our local Soil Conservation Service and local farmers, and in the mid-1970's were adopted by our State Department of Ecology, EPA's counterpart within our State. Since that time, every farmer in our State has adopted one or more of those practices. I think the average is about seven.

Senator GRAHAM. Any further comments on the question of the diagnosis of the status quo?

Ms. Cameron?

Ms. CAMERON. Mr. Graham, this morning we have heard from two of the witnesses with respect to the magnitude of the forestry industry impact on water quality, and also the range land and grazing impact on water quality. I think that we would like to have the opportunity to submit further information on those two issues in particular.

I believe that the whole story has not yet been told here this morning. I don't have particular data in front of me, but we believe that there needs to be much more serious monitoring on the part of the States for those two land use categories in particular.

There is a good start in S. 1114 addressing the monitoring for those two land use categories in the general sense that there is more direction for monitoring given to the States in S. 1114, but we would like to see, for example, the State of Maine implementing a systematic approach to monitoring for the effects of logging, since the logging industry is very important to Maine.

Likewise, there are many parameters that reflect the effect of grazing on water quality that not every State right now uses, or is not required to use. For example, Oregon uses temperature as an indicator of the effect of overgrazing on the streams of Oregon. That is a parameter that could be used more widespread in other States.

Senator GRAHAM. Mr. Tucker, then Senator Chafee.

Mr. TUCKER. I would like to take this opportunity to point out again the difference between the non-point approach of 319, and then the approach to the non-point problem of urban stormwater. We have been working under Section 402. Part of our concern has been trying to deal with a really non-point problem within a point

source program. I think the S. 1114 attempts to deal with this and provide mechanisms to deal with urban stormwater as more of a non-point problem, as it is. But I'd like to make that linkage.

Senator GRAHAM. Senator Chafee?

Senator CHAFEE. Thank you, Mr. Chairman.

This has been very interesting. I want to thank you for getting these witnesses, and thank all the witnesses, many of whom have come a good distance. You have come all the way from the State of Washington, Ms. Olson.

I think your comments were good; everybody's comments were good. Ms. Olson said education is better than a police force. It seems to me what we should strive to do here is to try to show that this is a worthwhile effort so that the people participating feel that there is something in it. That comes through education.

I must say, Mr. Tucker, I was appalled at the amounts that are being spent by larger cities to obtain the NPDS permits. I think you indicated that in Denver alone you have spent \$23 million to obtain your permits.

Mr. TUCKER. \$2 million for the permit applications.

Senator CHAFEE. To prepare for the permit applications? That must be a cottage industry out there, isn't it, preparing these permits?

Mr. TUCKER. It is quite a cottage industry all over the United States for those 200 and some communities. To give you an example of the cost, it was the monitoring cost alone. We were required to obtain wet weather stormwater data from eight sites. It ended up costing \$40,000 per site to obtain that data. We worked with the U.S. Geological Survey to obtain that information. We are now having to go back to even collect some additional data because some of the data that was initially collected wasn't adequate.

Senator CHAFEE. Thank you.

Dr. Weeks, you work for Agway, do you?

Dr. WEEKS. Yes, I work for Agway in research and development.

Senator CHAFEE. It seems me the information that you have obtained dealing with our favorite subject, manure, is something that hopefully would be shared in a widespread fashion throughout our country. In other words, what you are doing over there is very beneficial. How do you get the results of your activities out?

Dr. WEEKS. We have a number of publications, Senator, that go to our farmer members, plus we are involved in this cooperative research farm organization which takes information to 11 other cooperatives around the U.S., Canada, and France. So we do that.

We go to some technical meetings and present some reports on how the system is operating. We think in the next 90 days we have a very interesting opportunity because we are constructing the system at USDA Beltsville. We would encourage all of you to go see that when the system completed done and in operation.

Senator CHAFEE. Where is that, right out here?

Dr. WEEKS. In Beltsville.

Senator BAUCUS. Is that inside or outside the Beltway?

[Laughter.]

Dr. WEEKS. I don't know.

Senator CHAFEE. Just outside the Beltway, not very far.

[Laughter.]

Senator BAUCUS. Then, we'll go visit it.

[Laughter.]

Senator CHAFEE. Mr. De Golyer, you have quite an operation up there. You have 650 milkers?

Mr. DE GOLYER. Yes.

Senator CHAFEE. And you are going to 850?

Mr. DE GOLYER. Yes, within the next couple of years.

Senator CHAFEE. Just out of curiosity, I come from a small State, so this is big action for us, to see 850 milkers. How many people do you have helping you?

Mr. DE GOLYER. We have about 12 employees. By farming standards, it is a good sized farm, but compared to other businesses it is still a small business.

Senator CHAFEE. So it is a good sized farm up our way, I'll tell you.

Thank you all. Thank you, Mr. Chairman. This has been very helpful.

Senator GRAHAM. Senator Baucus?

Senator BAUCUS. Thank you.

I want to thank everybody, too, for not only coming a great distance, but also working hard to help find a combination here, a balanced approach to non-point source pollution control. It means a lot to all of us.

I'd like to change gears a little bit, though. Addressing the problem I think we have in this country, where if people are not losing confidence and faith in Government, they certainly are beginning to question it a bit more, particularly the membership organizations.

Each of you have spent a lot of time thinking about these issues. I believe you understand of this democratic process of ours, of compromise with small c, and in the best sense of the word, to try to reach a result. We all know, and certainly all of us who represent States, you know as people who represent your constituents, that often the people we represent have very strongly held views, and they are not altogether complimentary about the process.

So I am just curious about how you can help us, how we can help each other in addressing that. Because whether it is stockmen, dairymen, or cattle growers, or beef growers, or who ever, do you think your membership is going to like or not what we are doing here?

If they don't like it, assuming you think that basically, what can you do about addressing their outrage, very strongly held views that this is a bunch of baloney? What do we do about that? I am just curious about your comments here.

We are all sitting in this room. We are talking about this, and we have read the bill, and we know about it. But the people we represent haven't.

Ms. OLSON. I'd like to respond.

Senator GRAHAM. Ms. Olson?

Ms. OLSON. I think that we in agriculture, and I'll speak first broadly, and then specifically for my group.

We in agriculture have invested in clean water. That has been reiterated time and time again by numerous panelists today. I think that our group, the members that I represent, the farmers

back home on the farm, have a very difficult time with paper work, additional paperwork.

We are all small business people. We don't have the benefits of an accounting department and someone to keep track of the new changes in laws, etc. That falls upon generally a husband and a wife. In my case, it falls upon me. I have a family to take of. I have other responsibilities as well.

Farmers in general rebel against paperwork, not against the goal, but against spending a lot of additional time to document and prove what they have been doing. They feel that they are not given credit for the substantial hands-on actual accomplishments that they have made.

Senator BAUCUS. I agree with that. So what do we do about that?

Ms. OLSON. I think one of the things that we can do is the targeted site-specific idea that you have come up with in your bill. I think that if we could spend more time doing hands-on stuff, which site-specific gets at, involve those people in their watershed locally, I think that is a very positive way to bring out the best, and to show them that the intent is to do something, rather fill out papers.

Senator BAUCUS. I agree with that.

Your people have even more strongly held views.

Mr. GENHO. Yes, that is generally true of cattlemen. They do have strong views.

In the whole agricultural community there is a level of apprehension about what is happening to them, rapid changes and turbulence that is being caused in their industry by the regulatory process, a rapid increase in the regulatory process. It is very threatening to the agricultural community, to agriculture individuals. Part of that is the cost; part of that is the uncertainty about the future; part of that is the idea that we are responding to the perception instead of to the facts, to science.

Our operation, for the last several years, has spent about six cents per pound, for each pound of calf produced, either in mandatory complying, or voluntary compliance, or legal defense. We are a fairly large ranch, but as I have visited other ranchers who are looking at this—and six cents a pound is a lot per rancher—so, they feel threatened by this. I don't know of any rancher, and I know a lot of them across this Nation, who doesn't want to, genuinely want to, contribute to a solution. There is a genuine fear of the regulatory process.

There is a genuine fear that we are having to respond to perception instead of science, and that in most cases if we can be at the table participating, and if we are educated to the real necessity of the solution, I think that you will see that the strong-willed ranchers will be just as strong-willed on solutions as they are in their opinions.

Senator BAUCUS. I believe they will. You can see that happening.

Senator GRAHAM. Dr. Weeks?

Dr. WEEKS. I have just a couple of comments.

I think the first one would be that communications as usual is the key. We should turn around an old joke and say, "Hi. We are from the country and we are here in Washington to help you."

[Laughter.]

Dr. WEEKS. But communications is clearly the key. I think the concern of our farmer members is what are you folks doing down here which is going to increase our costs of operating? Farming is not a high profit margin business. When we compare the dollars that have been spent in human waste handling—and I make that analogy between human and animal waste handling; I think there is a strong analogy there—as we have more intensive agricultural operations, I really believe we need some dollar support. That is the key question that I think our farmer members have. What are you doing down there that is going to increase our costs of operating, and how are we going to be able to continually operate and make a profit?

Senator BAUCUS. Ms. Cameron, I'd like your perspective.

Ms. CAMERON. Well, certainly I also represent a constituency, particularly the 170,000 members and supporters of the Natural Resource Defense Council around the country, and then more loosely, I work with the members of the Clean Water Network, which are not only environmental groups, but also commercial fishing organizations, trade unions, and other groups. We collectively are very concerned that we need to fill the gap that we see in the Clean Water Act.

Senator BAUCUS. But are they going to be outraged about what we are doing here?

Ms. CAMERON. Pardon, I'm sorry.

Senator BAUCUS. Is your membership going to be outraged with, happy with, content with what we are doing? What is their view, and how do we get them to the degree that they are isolated and separate from this, to become part of the process working toward a common solution?

Ms. CAMERON. In terms of the overall framework of Title III, and the non-point source pollution provision in the bill, I feel that the framework is basically sound, particularly the emphasis on a watershed basis. We would like to see that watershed focus be strengthened even more, so that for example it is not entirely up to State discretion as to the scope of targeting.

For example, we support the approach in the Oberstar bill, H.R. 2543, that requires that all watersheds of waters that are already on a sick list, if you will, impaired or threatened list, that all of those watersheds be targeted by each State. Again, those are the States on listing, so it is not a Federal imposition of a target list, but it would be a Federal requirement that would say for you, Florida, all the waters that you have identified as being impaired or threatened we are now going to give you a required duty to restore and protect those waters.

Senator BAUCUS. I agree with you. I think Ms. Olson made a very good point.

We found on this Committee, backing up, this year I decided not rush pell-mell to reauthorize the environmental statutes, but rather hold a series of taking stock hearings to find out what works and doesn't work before we begin to reauthorize.

One development we discovered is the importance of regulators, if you will, working with businesses they regulate. That is the EPA for example, or a State regulatory agency for example, ought to go on site, visiting a firm, and not slapping violations on the firm, but

rather say here is a problem. Then the firm's environmental people could work with, for example, with the agency people, and they could find a solution.

Part of the solution could be, again, no fines, maybe a delay; but still a date by which the firm does meet the air quality, or the water quality standards, or what-not. It is much more cooperative. It is on-site in the sense that people are working together and they are finding the solution. They feel part of the process.

I think that we should try to, and not only with the Clean Water Act and non-point, but generally, pursue that approach, because I think it tends to build people's confidence so that they can see that this process really is working, it really is for everyone's mutual benefit, rather than having someone on high insensitively dictating a result that is often not really close to the solution, because the dictator hasn't considered other points that need to be considered.

Mr. DE GOLYER. I would like to comment, Senator.

I was intimidated coming down here. I have been very pleasantly surprised with the tone of this hearing, and the knowledge that you people have with the problems in agriculture. So it has been very pleasant for me.

My suggestion in helping agriculture to get behind this program is to work with the people who we are used to working with. That would be our local Soil Conservation Service people. We are used to having them help us solve problems.

Senator BAUCUS. They are highly regarded around the Country, too.

Mr. DE GOLYER. Yes. We are also used to working with the people from the Extension Service. We do feel a real strong need as my grandfather used to say that agriculture changed more in his lifetime than it changed from the time of the birth of Christ. I think it has changed more since my grandfather died.

We do need to have this research done by our Land Grant universities to give us the technology and the ways to solve these problems.

One final thing: You are talking about the perception of your bill. We have a real problem in our home community with the perception of our non-farm neighbors of how agriculture is run. We have had a citizen suit with our next door neighbor that went for \$4.1 million that they were asking for. My neighbor could have very easily bought his way out of this. I think Mr. McGuire kind of referred to this, as my neighbor has very high principles and knew what this meant to agriculture if the suit was successful.

The four families that brought this ended up, instead of \$4.1 million, they ended up with \$4,001. It might be said that while this suit is still on-going under the Clean Water Act, but you might say my neighbor won this battle. But it has cost him \$400,000 in legal fees. Part of the problem is that the Clean Water Act does not have the real good definitions for what is and what isn't compliance.

Senator BAUCUS. There was a comment this morning about citizens' suits. I could clarify that. There are no provisions in this bill which would allow someone to sue a farmer for his failure to comply with the plan. There is nothing in this that will so provide.

I thank you very much, Mr. Chairman.

Senator GRAHAM. Mr. Faircloth?

Senator FAIRCLOTH. Thank you, Senator Graham.

You all are involved with agriculture, and very much so am I. In fact, as I said earlier, some of the Senators were bringing somewhat of an analogy to the chicken and the hog to the breakfast. The chicken brings a days work, but the hog brings his life to it. That is pretty much what I am bringing here.

I think overall what we are saying here, as I tried to listen and to observe, there isn't any way to hire enough regulators, inspectors, supervisors, checkers to do the job. If it is done—and it will be done—it's going to have to be done because the people in agriculture, the non-point sources, are going to have to want to do it.

As Mr. Genho said, the people in the cattle industry do not want pollution. I am in this business, too. We have 16,000 acres of cattle land in North Carolina. I think the farm communities are doing a lot more than many people from the environmental section think.

We test hay for nitrates. We have many, many wells in the hog operations, too. We check it constantly, and monitor it. It can be done. It has to be a voluntary effort. We do not need more rules, more regulations, as Ms. Olson said, more paperwork, more reports, more filing, and more checkers.

We have had the Soil Conservation Service, which has been enacted in this country since 1933, for the sole purpose of what we are talking about, soil conservation. If you pollute it, you aren't conserving it. Soil and water conservation, that is what it was set up for in 1933 or 1934. Soil and water conservation, that was its purpose.

It is still in effect today. As far as I know, every county in the United States must have one. There must an infinitesimal number of counties that do not. What county are you from, Mr. Genho.

Mr. GENHO. Osceola County.

Senator FAIRCLOTH. What?

Mr. GENHO. Osceola County.

Senator FAIRCLOTH. Oh, you are from Osceola. But you have Soil and Water, of course. And this is the answer, and the reasonable answer to it. The agriculture community in this Nation is used to working with these people. We have worked with them—I was in produce farming at one time, and we worked from Collier County all the way up to Suffolk County, New York at Riverhead. We worked with the Soil Conservation people and the local agricultural people. We handled problems.

I do not think we need to come forth with an entire new set of rules, regulation, and checking. I think we have in the SCS the management group there to handle the problem. If they need further instructions, if we need to change something, we can change it. But we don't need to come with a whole new organization to implement the program.

I say we spend our lives with it everyday. We test wells by the dozens, and monitor what we are doing. Farmers are beginning to come to that. But I don't see new regulation and new rules.

What would you have to say to that? You work in the cattle industry.

Mr. GENHO. I agree. Again, my feeling is that agriculture in total, when we know the real problem, when we see scientific solutions, we will move forward to solve them. Working with organiza-

tions such as the SCS and the Extension Service, agriculture will solve those problems that are voluntarily organized on a local basis. You will find compliance much greater than you would realize.

Senator FAIRCLOTH. Also, you can put a monetary penalty to compliance, because as I said earlier, SCS and ASC are in the same building in the majority of the counties. I am sure they work closely with the cattlemen.

Mr. GENHO. There can be positive incentives, like I said earlier, they don't have to be cash, but they can be positive incentives which will encourage compliance also.

Senator FAIRCLOTH. Fifty cents a pound on cows is kind of high, but it is not as bad at 87 cents as it was at 52, is it?

Mr. GENHO. That is right. The market has been good to us this year.

Ms. CAMERON. Mr. Chairman, if I could respond to two key underlying themes that have been brought out today?

One of them is the idea of voluntary versus mandatory approaches. The other one being the paperwork burden on farmers.

The testimony of Mr. Warrick, as well as my own, has touched on those issues. On the paperwork burden issue, Mr. Warrick's testimony I think is very instructive. We tend to agree with what he says here.

He says,

If farms are targeted in impaired watersheds, as they are in S. 1114, a polluted run-off program should require each farm to develop an integrated whole-farm plan, which incorporates sustainable practices through a systems approach. Farm plans should emphasize cost-effective practices.

The plans should incorporate and give the farmer credit for all other conservation programs, including conservation compliance, the integrated farm management program option, the water quality incentive program, the wetlands reserve program, and the coastal zone management program, so that each farmer is required to do only one plan for the entire farming operation.

The planning process should provide flexibility so that the farmer can design options which are practicable and reasonable for that particular farming operation. Ultimately, however, the implementation of the plans components should be mandatory. Reasonable time lines should be provided to develop and implement plans. This approach is consistent with the recommendations for farm level planning contained in the Water Quality 2000 report.

So the idea in that excerpt is that we need to try to have one-plan-does-it-all, because recognize that farmers have very little time. They don't want to be in the office doing paperwork, if they can help it. We understand that. But it also underscores the support for a mandatory approach.

I have a brief list of reasons why we do not think that the voluntary approach, at least in impaired and threatened watersheds, is sufficient. We find that it tends to be costly. It traditionally relies on very cost-sharing ratios to get farmers to buy into the voluntary system. There often are ironically inadequate participation rates in many of the watersheds despite the pumping in of sometimes millions of dollars.

Decisions about who needs to get involved are made in a strategic manner, but they are often arbitrary, or just simply haphazard in terms of individuals stepping forth saying I want to do more, which is good, but it is not a systematic way of getting full participation in a watershed.

Also, there is fairness, as Mr. Warrick's testimony generally brings out. The farmer wants to know that his or her investments in water quality are being matched and are being fully successful because all of their neighbors in the watershed are pulling in the same direction. So there is a fairness element.

Basically, we need to have accountability for results. One of the reasons that we support requirements for whole watershed planning, whole watershed restoration, and also individual landowner responsibility in those watersheds is that by having requirements for environmental goals to be met, and for landowners to undertake either flexible site level plans or the mandatory management measures, that there is a greater infrastructure that is on the part of the Soil Conservation Districts, the State monitoring infrastructure, that all of those components will be more strategically targeted and established when everyone has a clear set of defined goals. Even if some of the goals don't kick in until a decade down the road, everyone knows what direction they are pulling in, and what needs to happen to reach those goals.

We find that all of those elements are there when we set up a system with some required action to be taken. They do not tend to be there when we have a purely voluntary program. In the recent law passed by Pennsylvania with mandatory nutrient management planning underscores that.

I'll just wrap up by quoting Representative Jeffrey Coy, who was the Pennsylvania legislator who led the effort for the recent mandatory manure management law there. Mr. Coy said he pushed his legislation because, "it was obvious to me that the voluntary approach was not working. We needed to turn the corner toward a mandatory program."

Senator GRAHAM. Senator Faircloth?

Senator FAIRCLOTH. Thank you, Mr. Chairman.

I'll ask this to anyone. If a voluntary program won't work, considering the size and the expanse of the agricultural community, and the thousands of problems there, if a voluntary approach to it won't work, how would we get enough people to supervise every farm and field in the United States? What would that take?

Mr. GENHO. Again, I am convinced that if there is adequate information, scientific solutions, good educational procedure, positive incentives, and the participation of agriculture it will work. So I guess I hadn't considered what would happen if it didn't.

Senator FAIRCLOTH. I haven't either. I just was raising the question.

Senator GRAHAM. Ladies and gentlemen, I want to echo the comments that have made earlier about how much we appreciate the effort that you have extended, particularly when have people who come almost every corner of the Country to educate us today. This has been a very exceptional hearing. I want to thank both who participated in the first panel, and you folks on the second. Your words have been well heard and recorded. I hope you will see the results of your insights as we move to the next stage of shaping this legislation.

I want to particularly thank my fellow Floridian. Everybody has talked about their agricultural background. I might say that my father came to Florida about 70 years ago to be a sugarcane

farmer, and we stayed to be dairy farmers. Maybe we could talk about milking some cows.

Thank you very much.

[Whereupon, at 1:12 p.m., the subcommittee adjourned to reconvene at the call of the Chair.]

[Statements submitted for the record follow:]

TESTIMONY OF RICHARD T. MCGUIRE, COMMISSIONER OF AGRICULTURE
AND MARKETS FOR THE STATE OF NEW YORK

Good morning Mr. Chairman, members of the Subcommittee. I am Richard T. McGuire the Commissioner of Agriculture and Markets for the State of New York, and pleased to be here this morning with my colleague, the New York City Commissioner of Environmental Protection, Albert Appleton.

Our principal purpose is to describe to the Subcommittee the unique approach that has been adopted between the farm community and New York City to address New York City's drinking water protection needs in its watershed, and the program's importance for the development of national nonpoint source (NPS) pollution control policy. I believe there are some important principles embodied in the New York City watershed agricultural arrangement that the Subcommittee may want to consider in reauthorizing the Clean Water Act (CWA).

I also appear before you today on behalf of the National Association of State Departments of Agriculture (NASDA). NASDA is nonprofit association of public officials representing the Commissioners, Secretaries and Directors of Agriculture in the fifty states and the territories of American Samoa, Guam, Puerto Rico, and the Virgin Islands. As the chief state agriculture officials, NASDA's members are keenly aware of the importance of balancing agricultural production and natural resource conservation on their state's and the nation's economy.

NASDA's broader position on the CWA does not necessarily reflect the views of New York State on that law or its administration. I am not here to testify for New York State on the CWA.

NEW YORK CITY WATERSHED PROGRAM

Today I will discuss the efforts which the farm community, New York City, local government, and New York State have taken to preserve water quality in the New York City Watershed area. This successful effort is based upon the prospective voluntary adoption of best management practices to control nonpoint source pollution by the more than 550 dairy farmers in the New York City Watershed area.

Farming has been practiced in the New York City Watershed area of Delaware, Schoharie, Sullivan, and Greene counties since long before New York City came to rely on the watershed for most of its water supply. The City has preserved its water quality in the midst of agricultural production for decades. Efforts to improve farming practices, especially through the adoption of soil and water conservation techniques, with the leadership of the Soil Conservation Service delivered through the local Soil and Water Conservation Districts and the Agricultural Stabilization and Conservation Service, have allowed farmers to maintain the economic viability of their farms by keeping their topsoil on the land. This voluntary, locally based effort by farmers has a proven record of success, not just in New York State but in most parts of the United States.

Agriculture in the Watershed has been changing. The pressures of the economics of dairy farming have led to larger herds of dairy cows, intensification of land use for crop production, and greater concentrations of animal waste. New measures, based upon the proven path of voluntary and locally based approaches, need to be implemented to cope with the increased requirements for drinking water protection and raw water quality maintenance in the New York City Watershed area. The Whole Farm Planning Approach Program is being implemented to meet the needs of farmers in the watershed, as well as the metropolitan-area urban public, which is dependent upon this surface water supply. This approach was the result of a lot of hard work by all who were concerned about long-term protection of the City's water quality, while maintaining the agricultural economy of the area.

In mid-1990, New York City circulated draft mandatory restrictive agricultural land use regulations in order to meet their goal of drinking water source protection without resorting to a costly filtration system. Uniform and inflexible regulations were seen as unworkable and undesirable by the local agricultural community due to their negative impact upon the farm economy of the region.

In December 1990, the New York City Department of Environmental Protection and the New York State Department of Agriculture and Markets cooperated in convening an Ad Hoc Task Force on Agriculture and New York City Watershed Regulations. This group was composed of local farmers, local agricultural, environmental and government organizations, state representatives, and technical advisors. The Task Force was comprised of a Policy Group and a Technical Support Group. Members of the Policy Group represented agencies that are directly involved in issuing and administering the proposed watershed regulations, groups that are affected by the regulations, and organizations that may contribute to facilitating them.

I have attached a copy of the Task Force final report with the Committee, so you may have the opportunity to study its membership and the program scheme as it emerged from these negotiations. The goal of the group was to find an alternative to a mandatory set of rules and regulations which would still achieve the desired level of water quality protection. Over the course of a year the Whole Farm Planning/Best Management Practices approach for the New York City Watershed concept was developed and evolved.

Farming in the New York City water supply watersheds presents a complicated environmental management problem. Farming methods and practices are a potential source of nonpoint source pollution and present a risk of pathogen introduction, siltation, toxics, and nutrients introduction to the City's reservoirs. Farm practice pollution control is critical for meeting the City's anti-degradation objectives, as well as the avoidance criteria of the Federal Source Water Treatment Rule and the State Filtration Rule. On the other hand, farming is a preferred land use as compared with more intensive uses like second homes, which pose even greater threats to the City's drinking water quality, with significant long-term environmental benefits, and the City wants to take all appropriate steps to keep farming economically viable and in control of the land.

A locally developed and administered program of best management practices, tailored farm by farm, with the voluntary cooperation of the farm operator, would contribute far more to achieving the avoidance criteria, as well as enhancing the viability of the farm enterprise and the agricultural economy. Discussions in the Ad Hoc Task Force convinced members of the Task Force representing the City and the farm community that the regulatory proposal took a purely water quality perspective and set absolute technological standards for all farm practices, to be applied uniformly in all farm situations (uniform setbacks from streams, berming pastures, control of all pesticide use, etc.).

The City, after consulting with appropriate regulatory bodies and after full review of federal and state regulations, was satisfied that such a program would meet the avoidance criteria for effective watershed regulation, and represents the best strategy for dealing with concerns of both the City and the farm community.

Whole Farm Planning/Best Management Practice Program Option

Guiding Principles—In place of the agricultural regulations, farmers have the option of participating in a voluntary Whole Farm Planning/Best Management Practice Program. These are the guiding principles for the program:

- The objective of the program is to protect the sources of the New York City water supply, while keeping farms in operation. Agriculture should be continued and promoted as a preferred land use in the New York City watersheds. Except for a general prohibition to safeguard against individual farm operators who exhibit a willful and irresponsible intent to pollute in a manner that threatens to significantly increase pollution levels and degrades the source waters of the City's water supply, the program will be entirely voluntary.
- The preferred approach to source protection for farms is the use of Best Management Practices (BMPs) developed to meet water pollution control policies under the 1989 NYS Nonpoint Source Water Pollution Control Act and Section 319 of the Federal Clean Water Act amendments of 1987.
- The mechanism of choice for selecting agricultural BMPs is preparation of a Whole Farm Plan for each farm. A collateral objective for each Whole Farm Plan is to sustain and improve the economic viability of the farm. Whole Farm Plans will be prepared by a local county project team, including personnel from the County Soil and Water Conservation District, Cornell Cooperative Extension, and the Soil Conservation Service.

Whole Farm Plans will involve these components: soil erosion control, animal waste management, plant nutrient management, domestic animal pathogen management, and chemical and pesticide management. Whole Farm Plans will address these agricultural contaminants: nutrients, pathogens, sediments, toxi-

cants, and organic matter. The level of control required for each Whole Farm Plan should depend on the presence of hydrologically sensitive areas.

- Incentives, including cost-sharing, will be made available by the City to participating farmers, supplemented by a reasonable mix of state, federal and local funding sources, if available.
- Continuing education, professional training, and local involvement are essential components of the Whole Farm Program.

The Whole Farm approach to drinking water quality source protection integrates selected management practices intended to provide short- and long-term protection of water quality, with a farm business plan designed to sustain a profitable agricultural enterprise, given the mix of physical, capital, and management resources available to and consistent with the objectives of the farm operator. Development of a farm plan to meet these twin goals requires a comprehensive assessment of all elements of the farm property, as well as the business strategies and practices that affect both.

The evaluation of current farming conditions and practices and the development of options for both the farm business enterprise and water quality protection will be a collaborative venture between the farm operator and the Cooperative Extension/Soil and Water District County Project Team, supported by the Soil Conservation Service, Cornell University faculty and staff, New York State Soil and Water Conservation Committee, and the New York City Department of Environmental Protection.

The systematic use of the Whole Farm Planning approach to accomplish pollution prevention in a large watershed system has not been previously attempted anywhere. The Whole Farm Plan is a new concept which requires the integration, and some modification, of the diverse views and convictions of the agencies involved. The purpose of Phase I of the Agricultural Watershed Protection Program is to perfect, test, and demonstrate the Whole Farm Planning approach on selected farms, and to strengthen the New York City/local partnership in the process.

Locally-Administered Whole Farm Planning/Best Management Practice Program—The City has established a locally administered program for the planning and implementation of Whole Farm Plans, in conjunction with watershed farm operators, with assistance from the New York State Soil and Water Conservation Committee, the Soil and Water Conservation Districts, Cornell Cooperative Extension, the New York State Water Resources Institute, the New York State Department of Environmental Conservation, the New York State Department of Agriculture and Markets, the Soil Conservation Service, and other appropriate institutions.

This program is responsible for:

- Reviewing existing BMPs for their applicability to watershed pollution control objectives.
- Developing and implementing a series of immediate demonstration programs with local farm operators to test the feasibility and define the methodologies of the Whole Farm Planning approach to source protection.
- Working with farmers to prepare Whole Farm Plans, and implementing those plans.
- Establishing a voluntary Whole Farm Planning/Best Management Practices Program for the entire farm community.

Voluntary Participation—Until December 31, 1996, the City is offering farm operators the opportunity to voluntarily participate in the Whole Farm Planning/Best Management Practice Program. A goal of 85 percent participation in this program by farmers throughout the watershed has been established.

Farm operators who choose to participate will be given until December 31, 1996, to work with their County Project Team to develop a Whole Farm Plan and agree to install practices according to the schedule outlined in the plan. Farm operators voluntarily participating in the Whole Farm Planning/Best Management Practices Program will be held harmless and not required to amend the farm practices agreed to in their whole Farm Plan even if, after the evaluation of the entire program in 1997, the City, in consultation with the Watershed Agricultural Council, determines there are changes needed in the watershed regulations or agricultural program. Participating farm operators would still remain responsible for violations of existing federal, state, and local standards pertaining to water quality.

Cost-sharing—Participating farm operators will receive City cost-sharing for both the planning and implementation of the Whole Farm Planning/Best Management Practices Program, to the full extent of any cost incurred, adjusted for whatever funding is otherwise made available under existing or future federal and state agricultural water quality and other cost-sharing programs. The City will pay the cost

to the farmer of participating in development of the Whole Farm Plan. Costs incurred shall include BMP operation and maintenance costs identified in the Whole Farm Plan, to the extent they represent new and additional farm operating costs considered necessary to the pollution prevention objectives of the plan.

Review of Progress in 1997—During 1997, the City, with the assistance of the Watershed Agricultural Council and other appropriate public and private parties, will engage in a review of the results of the voluntary agricultural best management program. This review will assess the extent to which the practices and facilities called for by the Whole Farm Plans have been, or are being, adopted on schedule and are being properly maintained. Also needed is an evaluation of whether the results are consistent with the requirements of the avoidance criteria and the City's anti-degradation water quality objectives. If the review does not justify a continuation of the program in its adopted form, the City will submit to the New York State Department of Health such revisions to the watershed regulations as it deems necessary to continue to meet its obligations and responsibilities.

The City will work with the Watershed Agricultural Council on developing parameters and criteria for evaluating the agricultural program in 1997, including a variety of program and regulatory options to consider in the event that changes may be needed.

Implementation of Principles and Standards—Agricultural BMPs, as developed by New York State in support of the nonpoint source water pollution control policies of State Law and Section 319 of the Federal CWA Amendments of 1987, are the preferred methodologies and techniques for implementing these principles and standards on farms in the New York City watershed system. The Whole Farm Planning approach will be employed to tailor the applicability of relevant BMPs to conditions peculiar to each farm, while providing for a farm management plan that sustains or enhances the efficiency, productivity, and economic profitability of the farm enterprise.

Scientific uncertainty exists when relating agricultural practices to their effects on raw water compliance with drinking water standards. Drinking water standards for raw water at its source covering some of the agricultural contaminants of concern are not defined. Therefore, as a general rule, Whole Farm Plans should call for the design, installation, management, and maintenance of any combination of BMPs necessary to limit the release of nutrients, organic matter, domestic animal-borne pathogens, toxic chemicals, and soil to any surface or ground water body, consistent with applicable state and federal laws and regulations, as well as with the water quality goals established for the watershed. In those cases where it can be shown that an activity on a specific farm leads to an actual violation of a legally adopted water quality standard, the farm shall be required to alter the activity to the extent necessary to meet the water quality standards.

While it may be possible to achieve zero discharge of some contaminants during some periods (i.e., avoiding winter land application of manure or relying wholly on biocontrols or cultural practices to control some pests) universal attainment of zero discharge for all agricultural contaminants at their source is not practically achievable.

BMP Implementation—The implementation of Whole Farm Plans may be viewed as a two-level process. First, the "installation" of physical structures prescribed by the farm plan will need to be arranged. These structures may include grass waterways, manure storage facilities, barnyard improvements, diversions, etc. Engineering expertise is needed from the design through final certification of construction. Engineering technical assistance needed includes: gathering of site-specific data on soil type, drainage characteristics, and topography; preparing construction drawings, specifications, and contract documents; reviewing design with the landowner; assisting the landowner in securing a contractor; surveying and staking out the project site; inspecting ongoing installations/constructions; and certifying that projects meet contract standards.

The second level of implementing Whole Farm Plans requires the integration of a farm's physical, human, and time resources so that prescribed changes can be incorporated into the operational routine of the farm. This level of implementation involves an array of educational activities targeted at changing perceptions, attitudes, practices, and beliefs of farm managers.

Summary of New York Watershed Program—Additionally, in New York we have taken a similar approach to our statewide non-point source program. In accordance with guidance provided by state agencies, individual counties have formed County Water Quality Coordinating committees, which in turn have developed County Water Quality Strategies. These strategies identify water quality problems and outline programs to address these problems. The strategies focus on the use of educa-

tion and technical assistance to prevent and remediate water quality issues at the local level. Because these programs and actions originate at the local level, the opportunity for success is greatly enhanced. When citizens have ownership of solutions to problems, action occurs and progress follows. The farm community has responded positively on this issue, as they have in the past, to programs which recognize their needs while pursuing water quality objectives.

While we are still in Phase I of the process and much has yet to be accomplished to prove that the process ultimately works, I believe this farm-by-farm approach is tentatively accepted by the farm community in the watershed as a much preferred alternative to a traditional top-down, standard-setting, enforcement, penalty system of regulation. In fact, I am persuaded that the latter approach cannot be made to work for farms, each of which is somewhat different from the other.

Before moving on to NASDA's overall position on CWA reauthorization, I would like to summarize the important principles embodied in this approach to non-point pollution prevention that has been adopted as the alternative to a uniform regulatory system for the farm sector of New York City's watershed.

- The system for pursuing the City's water quality objectives, as they are affected by the agricultural segment of the watershed community, was arrived at by negotiation and consensus—not by fiat.
- The program is locally delivered and administered by an existing—not a new—group of institutions with whom farmers are familiar; who understand farming science, methods and techniques, and farm business operations; and whom farmers trust.
- The responsible regulatory institution—in this case, New York City's Department of Environmental Protection—has created contractual relationships with these locally based delivery entities to serve its public policy objectives, and has established a collaborative mechanism with the farm community generally to assure continued communication, momentum, and support.
- The cost of both the farm planning process and the installation of practices called for by each plan to achieve the pollution prevention goals of the responsible agency is financed by the responsible agency—or, in any case, not by the farmer. Once the front-end costs are overcome, these improvements will benefit the economic operation of the farm.
- The program is voluntary, but there is sufficient unchallengeable legal authority in the background, coupled with a time threshold for a high rate of sign-up, to spur participation.
- Improved and sustainable (unsubsidized) farm profitability, combined with 100 percent cost-sharing for planning and the installation of water-quality-related capital improvements and practices, creates strong incentives for farm participation.

NASDA POSITION

Reauthorization of the Federal Water Pollution Control Act (commonly known as the Clean Water Act) is an opportunity to review the quality of our nation's water resources, assess our efforts to clean-up impaired waters and prevent potential pollution, and set a course to protect this vital resource. Today my testimony will concentrate on the area of nonpoint source (NPS) pollution and agriculture's efforts to prevent such pollution. NASDA recognizes the need to address agricultural nonpoint source pollution which may have adverse effects on the environment and human health. Agricultural operations, along with urban, construction, septic and natural sources, require a comprehensive and coordinated management strategy, much of which is already in place, but in many cases inadequately funded.

In order to reduce complex and diverse nonpoint source (NPS) pollution, a commitment of time and resources is necessary, similar to the 20-year commitment our country has made to eliminating point source pollution. However, management of this problem will require a different approach than that of point source pollution because, unlike point source pollution, NPS pollution is primarily a weather-related phenomenon that can be managed, but not feasibly eliminated. NPS pollution is caused by the inadvertent discharge of pollutants from a wide variety of society's most essential activities.

The Clean Water Act (CWA) is not alone in protecting America's waters from NPS pollution. Other ongoing programs at the federal, state and local levels must be funded fully, and coordinated with, not superseded by, the CWA. In particular, this includes the soil conservation and water quality provisions of the 1985 and 1990 farm bills and the state groundwater and source water protection programs of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA). The CWA reauthorization should not directly or indirectly create a federal water quality law or program

which supersedes, abrogates or impairs state water allocation systems and water rights.

PRINCIPLES OF THE CLEAN WATER ACT

The reauthorized CWA's central focus for NPS management solutions should be reasonable, voluntary, and based on incentives, education and technical assistance. NPS pollution management programs should emphasize the protection of water resources and state-designated water uses, including state-designated agricultural uses, recognizing the importance and needs of individual agricultural producers and other landowners affected by the CWA. This approach emphasizes the use of locally designed and applied, economically feasible, site-specific best management practices which do not infringe on private property rights.

The CWA contains valuable provisions for NPS management embodied in Section 319. Although Section 319 has been historically underfunded and has been hampered by bureaucratic roadblocks, all states now have approved Section 319 assessments and management programs. Amendments to the CWA should continue to focus on the 319 program as the means for states to identify nonpoint sources in critical areas, and to develop management programs to control discharge. Reauthorization of the CWA should provide increased funding and technical support for state management programs and local implementation. Management efforts funded by Section 319 should be directed to priority areas based on scientific assessments that identify water bodies with impaired or threatened uses. Priority, as determined by states, should be based on the magnitude of risk to human health, the protection of designated uses, and likelihood of further significant and unreasonable water quality degradation if no action is taken.

The proper management of NPS pollution lies in state and local efforts. As such, states should continue to identify and resolve their priority NPS water problems through administration of Section 319 funds. With state oversight and approval, local entities should continue to carry out these NPS programs. State and local programs should provide for a mix of research, development, education and technical and financial assistance for both planning and implementing actions aimed at achieving state designated uses. Agencies at the federal and state levels should harmonize objectives and coordinate funding for national and regional NPS management programs.

Strategies should be developed on a hydrologic unit, watershed-wide basis using an approach that includes the consideration of both surface and ground water quality. Programs should focus on cost-effective, site specific practices for individual operations with flexibility for implementation. Section 319 management programs on federal lands should be developed and implemented by the specific agency statutorily charged with management of the lands in question, rather than by regulatory authorities independent of that agency.

In order for Section 319 to work effectively for agriculture, the U.S. Department of Agriculture must play a lead role in the formulation and communication of technology-based best management practices in agriculture. USDA should assist in coordinating Section 319 programs with technology-based conservation measures adopted in the 1985 and 1990 farm acts, FIFRA pesticide regulations, wetlands protection, public lands management, and EPA groundwater policies.

An effective and cost-efficient response to water quality problems requires accurate and reliable information on the source, extent and impact of NPS pollution, as well as the effectiveness, utility and economic feasibility of conservation measures and best management practices. CWA reauthorization should include a strong financial commitment to further research, monitoring and assessment projects. Monitoring should include before and after sampling as well as frequent sampling during storm events and assessment of natural and historic loadings. Scientific research and monitoring projects should follow protocols developed by the U.S. Geological Survey and should be concluded on a watershed basis with local and state input. Representative pilot projects aimed at achieving market based incentives on a watershed or regional level should be encouraged. It is, however, inappropriate to provide the authority for citizen suits against individuals participating in NPS management programs. Moreover, a more prudent use of scarce resources is to provide monetary assistance to states for monitoring activities rather than to voluntary monitoring programs.

CURRENT EFFORTS TO PREVENT NPS

The existence of programs at all levels of government to protect water from potential NPS contaminants necessitates development of an effective coordination strategy to avoid conflicts and duplication of efforts. Failure to recognize this need

can lead to squandering of limited resources and may result in conflicting programs that may even increase the potential for pollution of ground water while trying to reduce the potential for pollution of surface water (or vice versa).

Approaches to protect water quality can be categorized as nonregulatory/voluntary, regulatory, liability, or comprehensive protection. Many farmers have voluntarily adopted best management practices and other measures that will help protect water from potential pollution. Continued research, education by public and private entities, technical assistance on developing or implementing water quality protection programs, economic incentives, and product stewardship are necessary to increase water resource protection.

Numerous efforts are underway to protect ground and surface water from potential NPS pollution. Among these are programs and legislation at all levels of government, that vary in type and structure. For the record, allow me to highlight a few of the federal, state and local regulatory and voluntary programs which currently exist.

The Coastal Zone Management Act—The original Coastal Zone Management Act (CZMA) was passed in 1972, amended in 1980, and reauthorized in 1990. The lead agencies for implementation of the latest CZMA programs are the Environmental Protection Agency (EPA) and the National Oceanic and Atmospheric Administration (NOAA).

Section 6217 of the 1990 legislation requires each state with a federally approved CZMA program to develop a "coastal nonpoint pollution control protection program" to implement coastal land use management measures for controlling NPS pollution. The states are able to provide maximum flexibility in establishing the state and local institutional arrangements to accomplish the control of NPS pollution. State programs, however, must be developed and implemented in conformity with national guidelines.

Federal Insecticide, Fungicide, and Rodenticide Act—Under FIFRA, the EPA collects environmental fate data that are used, among other things, to indicate whether a pesticide poses a threat to ground or source water. Based on such data, the agency may require label directions and precautions to inform the applicator that the pesticide must be used in a manner that prevents water supply contamination.

Also under FIFRA, the EPA may restrict, cancel, or temporarily suspend all or some pesticide uses that pose unreasonable risks to human health or the environment through contamination of water supplies.

The agency has proposed a Ground Water Restricted-Use rule that describes the criteria (i.e., a pesticide's tendency to leach) for identifying pesticides for possible restricted-use classification because of ground water concern. After the final rule is promulgated, EPA will initiate reviews to classify up to 30 pesticides as restricted-use chemicals because of their tendencies to leach to ground water. Restrictions may include limiting use to certified applicators.

Safe Drinking Water Act—Under the Safe Drinking Water Act's Public Water Systems Program (PWSP), the EPA regulated six pesticides and nitrate/nitrite in addition to other chemicals and biological contaminants. Under the drinking water regulations announced in January 1991, effective in July 1992, states must adopt new drinking water standards for 33 potential drinking water contaminants including 18 pesticides. The EPA has also developed Health Advisories for about 70 pesticides that are actual or potential ground water contaminants. In addition, EPA implemented new standards of 1 ppm for nitrite and 10 ppm for nitrate/nitrite as nitrogen (N) combined in July 1992.

EPA has established requirements for regular monitoring, public notification of contamination, and specific timeframes for removal of the contamination. Monitoring for the 18 pesticides covered under the new drinking water standards were phased in after July 1992. Such an approach gives states the opportunity to institute watershed and ground water protection measures to keep pesticides out of drinking water. EPA also conducts and enforces drinking water programs in states that do not have primacy or are not enforcing their programs adequately.

Comprehensive Environmental Response, Compensation and Liability Act—Superfund, created in 1980, is an important tool in EPA's response to the nation's hazardous waste problem. Approximately 31,000 hazardous waste sites have been identified. Some of these sites are in rural areas, and sometimes involve contamination of ground and surface water due to improper disposal of septic tank wastes and sludge containing hazardous substances such as PCBs, benzene, and toluene, or wastes from pesticides and fertilizer manufacturers. Estimated costs for cleaning up some of the Superfund sites are very high, running in the millions of dollars.

Toxic Substances Control Act—EPA has broad authority under Section 6 of the Toxic Substances Control Act (TSCA) to control manufacturing, processing, distribu-

tion in commerce, use or disposal of a chemical substance or mixture if it "presents or will present an unreasonable risk of injury to health or the environment." Under Section 4, EPA may require industry to test a chemical substance or mixture if the agency finds it "may present an unreasonable risk of injury to health or the environment". If the EPA decides that it lacks important information about toxicity or exposure, it can specify what information the industry must provide through additional testing if necessary.

Research on Transport and Transformation of Contaminants—In order to predict the movement of contaminants in the subsurface, and thereby predict potential human and ecological exposure, EPA's Office of Research Development (ORD) maintains a research program in transport and transformation of contaminants. Some of this research is done to predict the leaching behavior of agricultural chemicals. This includes advances in integrating process level information into predictive tools such as the pesticide soils leaching model PRZM, the pesticide ground water leaching model RUSTIC, and the development and application of the comprehensive environmental management model CEEPES to agricultural chemicals. In addition, a new effort is underway to support the Office of Water in determining the sorptive properties of soil as a factor in protecting wellheads from contaminant migration.

EPA has joined with the United States Department of Agriculture (USDA) and the U.S. Geological Service (USGS) in the Midwest Initiative on atrazine. Under a coordinated plan of study drafted in 1989, the three agencies selected the mid-continent soybean and corn-growing region to determine the regional factors affecting the distribution of atrazine, a herbicide of long-standing use, through the environment.

Information System for Preventing Ground Water Contamination from Pesticides—Tools exist to locate pesticide problem areas, and develop strategies for use of pesticides on a local level. These tools include models that have been developed to predict the leaching of pesticides to ground water, data that have been collected on soil properties and other relevant environmental factors, and geographical information systems for displaying and analyzing spatial information. These types of tools, however, have not been systematically integrated into a workstation framework of state and local risk management. ORD has initiated research to provide such a framework for states upon which they can develop locally meaningful pesticide management plans. The work will also include field evaluation and modeling schemes. The project is coordinated with related research on the effects of agricultural chemicals on water quality at USGS and USDA, in order to ensure integration of information and dissemination of results.

Methods for Assessing Aquifer Sensitivity to Pesticides—To assist states in assessing ground water vulnerability to pesticides as part of their efforts to develop pesticide management plans, EPA's Office of Ground Water and Drinking Water is preparing a technical assistance document on methods for assessing the natural sensitivity of aquifers to pesticide contamination.

President's Water Quality Initiative—The President's Water Quality Initiative (WQI), established during the Bush Administration, called for a vigorous effort to protect ground and surface water from contamination by agricultural chemicals, commercial fertilizers, and wastes, especially pesticides and nutrients. The WQI is using the combined expertise of USDA, USGS, EPA, and NOAA, to promote the use of environmentally and economically sound farm production practices, and to develop improved chemical and biological pest controls.

Under the WQI, USDA has established the USDA Water Quality Program to determine the precise nature of the relationship between agricultural activities and ground water quality; and develop and induce the adoption of agrichemical management and agricultural production strategies that protect ground and surface water quality.

Technical and financial Assistance Programs—USDA provides a number of technical and financial assistance programs to assist in protecting water resources.

- The *Agricultural Conservation Program (ACP)*, initiated in 1936, provides financial assistance to farmers for implementing approved soil and water conservation and pollution abatement practices. Cost-share payments may not exceed \$3,500 per year for 1-year agreements, or an average of \$3,500 for multi-year agreements. Except for Water Quality Special Projects, conservation priorities are set by states and counties based on local soil and water quality problems.
- The *Conservation Technical Assistance (CTA)*, initiated in 1936, provides Soil Conservation Service (SCS) technical assistance through conservation districts to farmers for planning and implementing soil and water conservation and water quality improvement practices.

- The *Rural Clean Water Program*, initiated in 1980 and ending in 1995, is an experimental program implemented in 21 selected projects under the authority of the Clean Water Act. It provides cost-sharing and technical assistance to farmers voluntarily implementing BMPs to improve water quality. Cost-sharing is limited to \$50,000 per farm.
- The *Extension Service* provides information and recommendations, in cooperation with SCS and conservation districts, on soil and water quality practices to landowners and operators.
- The *Farmers Home Administration (FmHA)* provides loans to farmers and associations of farmers for soil and water conservation, pollution abatement, and building or improving water systems that serve several farms.
- The *Rural Conservation and Development Program*, initiated in 1962, assists multicounty areas to enhance conservation, water quality, wildlife habitat and recreation, and rural development.
- The *Great Plains Conservation Program*, initiated in 1957, provides technical and financial assistance in Great Plains states to farmers and ranchers who implement total conservation treatment of their entire operation. Cost-sharing assistance is limited to \$35,000 per contract.
- The *Small Watershed Program*, initiated in 1954, provides technical and financial assistance to local organizations for flood prevention, watershed protection, and water management.
- The *Water Bank Program*, initiated in 1970, provides annual payments for preserving wetlands in important migratory waterfowl nesting, breeding, or feeding areas.
- The *National Agriculture Library* collects and distributes information on all aspects of U.S. agriculture, and has received special funding to develop a new information program on agriculture and water quality.

USDA Research Programs—One of the objectives of USDA's Research Plan for Water Quality is to improve existing and develop new cost-effective agricultural systems to address water quality problems. USDA's Agricultural Research Service (ARS), Cooperative State Research Service (CSRS), and Economic Research Service (ERS) conducts research on agriculture and water quality. ARS conducts research on new and alternative crops and agricultural technology to reduce the impacts of agricultural production on soil and water. CSRS coordinates soil conservation and water quality research conducted by State Agricultural Experiment Stations and land grant universities. CSRS allocates funds appropriated by Congress for special and competitive grants for water quality research. ERS estimates the economic impacts of existing and alternative policies, programs, and technology for preserving and improving soil and water quality. Along with the National Agricultural Statistics Service, ERS collects data on agrichemical use, agricultural practices, and costs and returns.

Farm Bill Programs—The Food Security Act of 1985 has four major provisions that contribute to meeting water quality protection objectives; the Food, Agriculture, Conservation, and Trade Act of 1990 adds four additional programs.

- *Conservation Reserve Program*—The Conservation Reserve Program (CRP), authorized in the 1985 Farm Bill and expanded in size and scope to cover water quality concerns, allows USDA to make annual rental payments to landowners who voluntarily retire highly erodible cropland and other environmentally critical lands from production for 10 years. It pays up to 50 percent of the cost for establishing a soil-conserving cover crop on the retired lands.
- *Conservation Compliance*—The Conservation Compliance provisions require farmers who produce on highly erodible cropland to develop and implement a conservation compliance plan by January 1, 1995. The requirement affects 40 percent of U.S. farmers, 135 million acres of highly erodible land, and involves 1.3 million plans. Less than 2 percent of highly erodible land will be uncovered once the plans are implemented. A combination of the conservation reserve and conservation compliance program is projected by USDA to reduce erosion by 1.5 billion tons per year, half of all erosion on all cropland.
- *Sodbuster & Swampbuster Provisions*—Sodbuster provisions prevent farmers from new production on highly erodible land unless it is done under an approved conservation plan. Swampbuster provisions prevent farmers who convert wetlands to crop production from collecting farm program benefits, unless USDA determines that conversion would minimally affect wetland hydrology or biology.
- *Wetlands Reserve Program*—The Wetlands Reserve Program (WRP) is a voluntary program offering landowners a chance to receive payments for restoring and protecting wetlands on their property. Authorized by the 1990 Farm Bill,

the WRP provides a unique opportunity for farmers to retire marginal cropland and reap the many benefits of having wetlands on their property. WRP obtains 30-year or permanent conservation easements from participating landowners and provides cost share payments for wetland restoration. Currently, 50,000 acres are under easement to restore previously converted wetlands, reducing NPS pollution potential, and enhancing wildlife habitat, flood control, and ground water recharge.

- *Water Quality Incentive Program*—The goal of the Water Quality Incentive Program (WQIP) is to achieve source reduction of agriculture pollutants by implementing management practices (BMPs) in an environmentally and economically sound manner on 10 million acres of farmland by the end of 1995. USDA provides agricultural producers with the necessary financial, educational, and technical assistance required to make changes in management systems to:

- 1) restore or enhance the impaired water resources where agricultural NPS pollution has a detrimental effect; and
- 2) prevent future impairments.

Producers must submit applications for enrollment, and a long-term agreement is developed, generally for three years. The WQIP incentive payment limitation is \$3,500 per person per year for up to 5 years. Eligible acres for WQIP has expanded to include areas identified in state NPS management plans (Section 319), areas with shallow karst topography, and other environmentally sensitive areas.

- *Conservation Environmental Easement Program*—The Conservation Environmental Easement Program provides for permanent easements on lands that pose a significant environmental threat. The exact eligibility for these lands is yet to be determined, and funding is not yet available.
- *Integrated Farm Management Program Option*—The Integrated Farm Management Program Option adds planting flexibility to federal farm programs, and encourages farmers to adopt resource conserving crop rotations to help prevent soil erosion and protect water quality on 5 million acres. The program requires farmers to carry out an approved farm management plan to promote the use of soil conserving crops and rotations on at least 20 percent of their crop base qualified for federal programs.

National Water Quality Assessment Program—The National Water Quality Assessment Program is a major national assessment designed to describe the status and trends of U.S. waters and identify the factors that affect water quality. In the pilot phase of the project, the USGS is investigating the extent and location of ground water pollution by agricultural chemicals in several regions of the U.S.

Mid-Continent Herbicide Initiative—In cooperation with USDA's Midwest Initiative, USGS is conducting the Mid-Continent Herbicide Initiative, a five- to ten-year research program on the impact of the agricultural herbicide atrazine on ground and surface water.

USGS Federal-State Cooperative Program—This program is a partnership for water-resources investigations involving 50-50 cost-sharing between the USGS and more than 1,000 cooperating state or local government agencies. The USGS performs most of the work on behalf of the cooperators. A variety of hydrologic data collection activities and water-resources investigations are included in the program. Examples include providing support for mapping aquifers, for monitoring pesticide contamination, and assisting in developing wellhead protection programs.

State Water Resources Research Institutes Program—Under this program, USGS provides grants to 54 state and U.S. territory Water Research Institutes at land-grant colleges or universities. The grants support research, information dissemination, and training for students in water resources fields.

USGS Information Dissemination Programs—Through its annual National Water Summary report, USGS provides water quantity and quality information on a state-by-state and national basis to aid policymakers in the analysis and development of water policies, legislation and management actions. The report also includes case studies of NPS contamination and summaries of studies on managing and coordinating federal and state water protection efforts.

USGS' Hydrologic Data Collection Program provides information on the quantity, quality, location, and use of the nation's surface and ground water. Data collection stations are maintained at selected locations to provide records on streamflow, reservoir and lake storage, ground water levels, and the quality of surface and ground water. These data form an information base that support national and regional water-resource assessments.

Maine's Pesticide Control Regulations—The Maine Pesticide Control Act of 1975 is the primary legislative authority to regulate the labeling, distribution, storage, transportation, use, and disposal of pesticides in Maine. Under this Act the state may cancel the registration of a pesticide, restrict its use, or suspend its use if it poses an imminent hazard. Part of the state's pesticide registration fee is deposited into a fund to cover the costs of Maine's Integrated Pest Management (IPM) program. The state is adding training in ground water protection to its restricted-use pesticide certification program. The state's Pesticide Control Board has the authority to designate critical areas where pesticide use would present an unreasonable threat to water quality.

Iowa's Restrictions on Atrazine—Prior to EPA's classification of atrazine as a restricted-use pesticide in 1991, Iowa classified atrazine as a restricted-use pesticide, limiting its use to certified applicators. Iowa reduced the maximum allowable application from 4 to 3 lb/acre/year, and restricted maximum application to 1.5 lb/acre/year in contaminated or vulnerable ground water areas. Additionally, Iowa now prohibits atrazine application within 50 feet of a sinkhole, well, cistern, lake, or surface water impoundment, and mixing, loading and repackaging within 100 feet of the same.

California's Pesticide Control Measures—Proposition 65 prohibits a person in business with 10 or more employees from knowingly discharging a chemical known to cause cancer or reproductive toxicity into water or onto or into land where the chemical may pass into a source or potential source of drinking water. The Pesticide Contamination Prevention Act was passed specifically to try to prevent or minimize future ground water contamination by pesticides.

Nebraska's Restrictions on Fertilizer Use—The Central Platte Natural Resource District (a multi-county regional political subdivision) has established restrictions on nitrogen fertilizer use in a designated Groundwater Management Area. The program has three phases depending on the concentration of nitrates found in wells. All phases include requirements for education, collection of soil and water samples, and efficient fertilizer use. The most severe phase totally bans applications.

Fillmore County, Minnesota's Erosion Control Ordinance—Fillmore County is located in a karst area of Minnesota and has identified agricultural runoff and erosion as sources of both surface and ground water contamination. The County's Erosion Control Ordinance considers any occupiers of farmland to be in compliance if: (1) they are using soil conservation practices approved by the County Soil and Water Conservation District Board; (2) they do not have rills, gullies, or sediment deposits in their fields; and (3) their farming methods do not create sediment problems on adjoining properties. Violators of the ordinance have 30 days to work with the County Soil and Water Conservation District to develop a plan that must include: (1) specific practices to stop the sedimentation; and (2) a timetable for completing the practices.

Maryland Critical Area Program—The goal of the program is to improve the water quality of the Chesapeake Bay. The Maryland Conservation Reserve Program will pay farmers \$20 per acre annually to enroll cropland within critical areas and along stream borders in the Federal CRP.

Chesapeake Bay Nutrient Reduction Program—The Chesapeake Bay Agreement of 1987 calls for a 40 percent reduction of nitrogen and phosphorus entering the main-stream of the bay by the year 2000. Maryland, Pennsylvania, and Virginia have initiated nutrient management programs to assist in reducing agricultural NPS pollution to the Bay. After over five years of significant cooperation on the part of the landowners, experts now believe that agriculture may not be the source of nutrient loadings to the Chesapeake Bay. In fact, the Environmental Defense Fund released a 1988 report which considers septic systems, high density development, sewage treatment plants, and atmospheric deposition as the dominant sources of nitrogen in the Bay.

- Maryland's Cooperative Extension Service assists farmers in the development of nutrient management plans under *Maryland's Nutrient Management Program*. Since 1989, farmers have prepared 748 plans, covering 49,966 acres of cropland. Nutrient management plans include manure tests for nutrient content, soil tests, documentation of crop histories and manure management, documentation for a statewide nutrient management data base, and personalized service from consultants. First priority for preparation of the plans is given to farmers applying for state cost-share funds for all animal waste storage BMPs.
- *Pennsylvania's Nutrient Management* cost share program is funded in part by the Chesapeake Bay Program. Cost sharing for installation of BMPs is available to farmers within priority watersheds where they must adopt nutrient management plans. Such plans include manure tests, soil tests, summaries of recom-

mended nutrient applications, and provisions for verifying nutrient and pollution reduction. Conservation districts provide technical assistance in developing the plans, and a mobile nutrient laboratory assists with rapid analyses of soils, water, and manure.

- *Virginia's Chesapeake Bay Preservation Act* requires farmers in the 13 coastal counties to develop water quality management plans that include integrated pest management plans, soil conservation plans, and nutrient management plans. Since 1989, the state has required farmers statewide to develop nutrient management plans to receive cost share funds for animal waste BMPs. A new law allows tax credits for purchases of manure and pesticide spreaders for farmers with nutrient management plans approved by their local conservation district.

Kansas' Cost-Share Efforts under the State Water Plan—In 1989, Kansas established the State Water Plan Fund to serve as a dedicated source of funding for state water planning activities. The economic incentives are available both for practices to treat highly erodible land and practices to protect water quality by limiting runoff of agricultural contaminants.

North Carolina's Cost-Sharing to Reduce Nutrients—The voluntary North Carolina Agricultural Cost-share Program was established to protect surface water from contamination by sediments, nutrients, animal wastes, and pesticides. The program pays farmers 75 percent of the average cost to implement appropriate BMPs.

Jefferson County, Washington's Water Quality Improvement Fund—Washington state provides \$200,000 to Jefferson County for loan to county residents in a low-interest loan program—the Jefferson County Water Quality Improvement Program—which finances major NPS pollution control projects. The funds for the state loan are from the state's Revolving Loan Fund, capitalized by an EPA grant and a 20 percent state matching grant. The Fund is designed to encourage and assist county residents in repairing or upgrading existing septic systems under the direction of the County Health Department and in designing and implementing farm plans and agricultural BMPs under the direction of the County Conservation District.

Iowa's Education and Technical Assistance Efforts—Iowa's 1987 Groundwater Protection Act establishes a program for research education, and demonstration projects to address ground water problems caused by agricultural contaminants and other sources. The law requires the state Department of Agriculture and Land Stewardship (DALS) to promote the adoption of BMPs for soil conservation and for reducing ground water contamination from agricultural chemicals. As part of this effort, DALS is helping finance the Private Pesticide Applicator Training Program conducted by Iowa State University Cooperative Extension Service, which is educating over 60,000 farmers on environmental and personal safety when applying fertilizers and restricted-use pesticides. The program also covers nonchemical methods to control weeds and pests.

Wisconsin's and Minnesota's Farmstead Assessment Worksheets—Wisconsin and Minnesota have prepared pilot versions of worksheets to assist farmers in assessing the effectiveness of farmstead practices in protecting drinking water. Practices for assessment include well condition, pesticide storage and handling, fertilizer storage and handling, household wastewater treatment, and livestock waste storage. Accompanying each worksheet is a separate publication with recommendations on modifying practices to minimize pollution risks, and suggested sources for additional information.

Maine's BMP Manual—Maine collaborated with SCS, the Extension Service, and farmers to produce a BMP manual that educates farmers on the characteristics of agricultural chemicals and offers practical tips on protecting water from contamination.

Virginia's Outreach Efforts—The Virginia Water Resources Center has developed instructional materials, exhibits, and publications on water quality protection. The Virginia Extension Service conducts water quality related outreach activities for the agricultural community as well as local citizens, local government staff, and students.

State Research and Data Management—Basic and applied research that supports water quality protection efforts is being carried out by the states, mostly at state Agricultural Experiment Stations, landgrant universities, and Water Resources Research Institutes. Much of this research is at least partially funded by federal grants. States are also developing data management systems to store and maintain the information they need to implement their water quality protection efforts.

- *Connecticut*—The College of Natural Resources of the University of Connecticut conducts research on pesticide usage issues and on IPM, while the state Agricul-

tural Experiment Stations study the fate of pesticides in the environment. Connecticut has an extensive data base on the hydrogeological conditions of the state. In cooperation with USGS, the state Department of Environmental Protection has collected information on all watersheds, the properties and distribution of aquifers, depth to water tables, water quality in vulnerable or sensitive areas, locations of public water supply wells, locations of pollution sources, etc.

- *New York*—The state Water Resources Research Institute at Cornell University conducts research on the water quality effects of agricultural chemicals. Researchers are evaluating the relationship between pesticide application practices, crop production, and ground water quality for potato crops. In addition, the Institute is interested in studying the effects of soil organisms on chemical transport, microbiological degradation of chemicals, transport of microbes within the soil, and the toxic effects of ground water contamination on ecological systems. Faculty at Cornell, Oregon State University, Michigan State University, and the University of California at Davis have been developing a toxicological information system called EXTOXNET. The system will be used by Extension agents to answer questions about current or potential contamination by agricultural contaminants.
- *Pennsylvania*—Pennsylvania State University is involved in several research efforts. First, Penn State and three other U.S. universities are studying the environmental fate of pesticides under minimum and conventional tillage. Second, Penn State is involved in a cooperative venture to reduce NPS pollution in the Chesapeake Bay watershed. Third, the university participates in a well-funded program to develop expert systems for pest management on all crops. Fourth, Penn State is interested in developing insect and disease forecasting and monitoring techniques; these include counting insects and the use of weather-based data to predict the occurrence of plant pathogens in food crops. Finally, Penn State is studying pest resistance in apples in a cooperative project with the University of Vermont and four or five other states to study how to increase resistance in host or crop plants through selective breeding.

Comprehensive State Ground Water Protection Program—Since 1984, EPA has encouraged states to develop state ground water protection strategies and programs, and supported the states' efforts with technical and financial assistance. In 1989, EPA established a high-level Ground-Water Task Force to "develop a strategy for the direction EPA will take in ground-water protection." The task force released its final report that sets forth a new strategy to ensure comprehensive protection of the nation's ground water resources. A key component of this strategy is to actively involve state officials in developing and implementing Comprehensive State Ground Water Protection Programs (CSGWPPs). EPA will promote the development of CSGWPPs through technical and financial assistance to the states. To the extent authorized by federal statute and consistent with federal program objectives, EPA will defer to state policies, priorities, and standards once the agency recognizes that a state has developed a comprehensive protection program.

Wellhead Protection Programs—The Safe Drinking Water Act requires each state to prepare a Wellhead Protection (WHP) Program to protect public water supply wells from all potential sources of contamination. In many instances, regional agencies and local governments have taken the initiative in pursuing WHP. As of September 30, 1992, EPA has approved 25 state WHP programs. Some states are developing measures to deal with agricultural sources within WHP areas. In Florida, regulation of pesticide use within WHP areas is awaiting modeling of pesticide behavior in soil and water for selected restricted-use pesticides. Also, efforts to develop policy or regulations for governing nutrient discharges to ground water have begun. The 1990 Farm Bill includes a provision to make cropland within WHP areas eligible for inclusion in the WQIP and the CRP.

Drinking Water Program Implementation—The Safe Drinking Water Act directs EPA to establish minimum national drinking water standards which set legally enforceable limits on the amounts of potentially harmful substances, including some pesticides and nitrate, in drinking water. Under Congress' direction, EPA has granted, since 1974, primary enforcement authority to fifty states and four territories.

Pesticide Management Plans—Because of site-specific differences in ground water sensitivity and pesticide usage, EPA believes that states are in the best position to tailor pesticide prevention management measures to local conditions. Under the Agency's pesticide and Ground Water Strategy released in 1991, states implement State Pesticide Management Plans (SMPs). In line with this approach, EPA is providing funding and guidance to states to assist them in developing generic SMPs, and in building the state's capacity to evaluate such factors as ground water vulnerability, monitoring data, and how and where the pesticide of concern may be used.

The ground water strategy explains that under FIFRA, EPA may require states to develop chemical-specific SMPs for a particular pesticide of concern as a condition of continued use of that pesticide. The SMPs may vary widely from state to state, depending on a state's ground water sensitivity assessments, the level of pesticide usage in the state, and the state's ground water protection philosophy. The SMPs must include several components, including discussion of roles and responsibilities, legal authorities, prevention actions, available resources, monitoring, enforcement, and response detections.

Underground Injection Control Program—A provision of the Safe Drinking Water Act mandates the development of an EPA-approved underground injection control (UIC) program for each state, U.S. possession, or territory. The purpose of the program is to prevent contamination of underground sources of drinking water by injection wells, classified into five categories by the EPA. Class V wells include agricultural drainage wells, which may pose a high potential for ground water contamination. Agricultural drainage wells may receive field drainage from precipitation and flood waters, irrigation return flow, and animal yard, feedlot, or dry runoff. Potential contaminants include suspended solids, pesticides, nutrients, salts, organics, metals, and microbes including pathogens. Current EPA regulations authorize Class V wells to operate by rule if: (1) their existence was reported to the states or EPA within the specified time; and (2) they do not contaminate an underground source of drinking water to the extent that it would violate a maximum contaminant level (MCL) or otherwise endanger public health.

S. 1114, THE WATER POLLUTION PREVENTION AND CONTROL ACT OF 1993

The Water Pollution Prevention and Control Act of 1993, S. 1114, is a comprehensive reauthorization of the CWA. The bill would extend and enlarge the scope of the state revolving funds, strengthen the state watershed planning process and the NPS control program, and address the problem of combined storm water overflows. It also makes significant changes to provisions related to toxic discharges, permits, and enforcement.

Environment and Public Works Committee Chairman Max Baucus and Ranking Minority Member John Chafee are to be commended for developing this legislation which is currently serving as the major focus of the reauthorization debate in the Senate. The bill is markedly improved from S. 1081, legislation which was introduced in the 102nd Congress. The Senators revised S. 1081 to incorporate many of the principles I've outlined today; concepts like flexibility, watershed-wide protection, and site-level planning.

At this point I would like to address a few specifics in S. 1114.

Water Quality Standards—S. 1114 modifies the water quality standard goals of the CWA. As opposed to the current "fishable and swimmable" standard of the Act, the bill adds a "wildlife" and "social development" criteria to the standard. NASDA cautions the committee against going too far in creating the new standard which becomes the bright line measurement for the watershed management plans in the out years. Bio-assessments tend to be acceptable indicators of potential problems, but they are not appropriate for regulatory purposes. We must not overburden economic production with costly practices simply for an arbitrary "social" standard, and we must remember that the Endangered Species Act is designed to protect such species. While wildlife habitat provides some indication of water quality, Congress should not move too far in that direction.

Monitoring and State Reports—It is vital that an improved system for monitoring nonpoint source pollution is developed. While it is appropriate to use current information in the two year start-up period of S. 1114, we must do a better job of monitoring pollution contribution and improvement during phase one of the planning process. Current Section 305(b) reports do not provide EPA with information in a standard form which allows for accurate reporting. Current reports, which compare apples to oranges, are incomplete and inaccurate. Since S. 1114 increases the monitoring responsibilities of the states, and uses that information to determine future requirements, the system must be improved and standardized so that the information is accurate and usable by the states and EPA. The Water Quality Council established in S. 1114 should be a positive step forward to improving the system.

The citizens monitoring provisions of the bill should be completely deleted. Statutory language is not necessary for the public to make comments to states about water quality. In times of scarce economic resources at both the federal and state levels, funds for monitoring training and education should be provided to the states to improve their monitoring abilities, not used to fund or educate a band of vigilantes who lack the scientific expertise to assess water quality or to properly monitor

change. The citizens monitoring provisions of S. 1114 do not help the states. In fact, in many cases, the provisions will harm the states abilities to perform their monitoring duties.

Site-Specific Plans—In general, S. 1114 has provided the flexibility and site-specific planning opportunities that have proven workable in a number of areas, including the New York program we are explaining today. NASDA is an active participant in the Agriculture Clean Water Working Group, and that group is eager to work with this Subcommittee to address specifics about the phase one and phase two planning periods so that necessary modifications can be made to the bill that are workable at the state and local levels.

The final CWA product must stress the need for site-specific plans to remain flexible and be based on sound technical and financial assistance. A mandatory hammer approach does not work because the Agencies cannot enforce them properly, and mandatory programs create an atmosphere of animosity rather than one of cooperation. As you will see with the New York experience, technical and financial assistance in a cooperative fashion is successful, whereas mandatory hammers are not.

Specifically in phase one, S. 1114 provides an automatic exemption for producers with conservation compliance plans. NASDA recommends that Congress expand that provision to include producers with Water Quality Incentive program plans, Integrated Farm Management Option plans, a whole-farm management plan under a state or regional program (like the Chesapeake Bay program), and other similarly strong programs which provide as much pollution prevention management as the conservation compliance plan or that required by S. 1114.

The Subcommittee may want to also review the Rural Clean Water Program (RCWP). Section 208 of the CWA provided that states prepare statewide and regional plans, based on watersheds, for the prevention of both point and nonpoint source pollution. Rural NPS pollution was addressed through the establishment of the RCWP as a parallel effort complementing the funding of municipal sewage districts. This program was very successful in the pilot areas where it was implemented.

Watershed Definition—Phase two of S. 1114 establishes the concept of watershed-wide planning, an approach which allows for targeting of scarce resources to impaired areas. It is important that watersheds be defined as subwatersheds for the purposes of these provisions rather than one of the 21 watersheds in the country.

States, as appropriate, have no authority to control NPS outside of the state boundaries. However, in many cases watersheds will cross state lines and some type of accommodation needs to be made for these circumstances. The legislation provides EPA the authority to mediate after a problem is created. NASDA recommends that language be include provide an opportunity for governors to work cooperatively to address the situation before problems occur.

Funding and Time Table—S. 1114 basically provides 10 to 12 years and limited federal funds to manage NPS. The federal government has dedicated over 20 years and a tremendous level of federal funding to control point source pollution. Congress should not expect agriculture and other nonpoint sources to achieve the more complex pollution prevention in a relatively short period of time with few federal dollars. Congress has not funded Section 319 at levels necessary to implement programs fully, and with the current budget atmosphere, there is no reason to believe that additional appropriations are forthcoming. S. 1114 can authorize spending (and its authorization levels are too low), but the appropriations process tends not to fully fund these programs. Further, all indications from the Administration are that funding at the levels in S. 1114 will not be available. When that occurs, the states are left holding the bag. Unfunded federal mandates have put an economic strain on states which they can no longer absorb. And when both the federal and state governments fail to provide the funding necessary, it's the producer who suffers.

NASDA believes that phase one should be ten years in length rather than five. Five years simply is too short a period to properly develop and implement site-level plans, and then monitor the results. We must remember there is a lag time between implementation of practices and a corresponding water quality benefit.

CONCLUSION

Mr. Chairman, thank you for the opportunity to participate in this very important hearing on nonpoint source pollution and reauthorization of the Clean Water Act. I would encourage the Subcommittee to review in detail the New York City Watershed Program. Many of the principles embodied in the New York City watershed agricultural arrangement should be strongly considered when Congress reauthorizes the Clean Water Act (CWA). In order to reduce complex and diverse nonpoint source pollution, a commitment of time and resources is necessary, similar to the 20-year commitment our country has made to eliminating point source pollu-

tion. However, management of this problem will require a different approach than that of point source pollution because, unlike point source pollution, NPS pollution is primarily a weather-related phenomenon that can be managed, but not feasibly eliminated. NPS pollution is caused by the inadvertent discharge of pollutants from a wide variety of society's most essential activities. Agricultural operations, along with urban, construction, septic and natural sources, require a comprehensive and coordinated management strategy, much of which is already in place, but in many cases inadequately funded. As has been the case in New York, the NPS management programs in the CWA should be reasonable, voluntary, and based on incentives, education and technical assistance.

I'll be happy to answer any questions you may have.

STATEMENT OF ALBERT F. APPLETON, COMMISSIONER, NEW YORK CITY
DEPARTMENT OF ENVIRONMENTAL PROTECTION

Mr. Chairman, members of the Subcommittee, I am Albert F. Appleton, Commissioner of Environmental Protection for the City of New York. In addition to setting environmental policy, the Department of Environmental Protection is the City's water and sewer authority. I am here today to express New York City's support for the swift reauthorization of the Clean Water Act and for strong nonpoint source pollution control provisions. I am particularly pleased to be testifying with Commissioner McGuire, my colleague from the New York State Department of Agriculture and Markets. The Department of Agriculture and Markets and the City's Department of Environmental Protection, along with communities and citizens in the City's upstate watershed, are joining together in ground breaking nonregulatory, goal-oriented partnerships that, through nonpoint source pollution control and watershed protection, will preserve New York City's unparalleled drinking water supply.

Great improvements to water quality have been realized since the Clean Water Act's enactment. At the same time, it is widely recognized that new clean water strategies are now required. Recent studies, both federal and others, have consistently concluded that, as industrial wastewater and municipal sewage discharges come under increasing control, pollution from nonpoint sources is now the most significant cause of water quality degradation. If the Congress does nothing else in reauthorizing the Clean Water Act, it must commit program and financial resources proportionate to the scope of the nonpoint source problem. Nonpoint pollution sources must be attacked today as aggressively as point sources have been since the enactment of the Act.

The two keys to controlling nonpoint source pollution are pollution prevention and environmentally-appropriate land use management. One of the clearest lessons of the Dinkins Administration's aggressive watershed protection, harbor-estuary, and other environmental protection programs is that it is significantly more cost effective to prevent pollution than it is to clean it up. Another lesson is that the lack of proper land use safeguards and the misuse of environmentally-sensitive areas are principal causes of nonpoint source pollution. No nonpoint source pollution control programs will be successful without addressing these problems. Pollution prevention and environmentally-appropriate land use must be integrated with point source controls. This will require the flexibility to apply a broad array of strategies. Comprehensive, ecosystem-wide programs that address all sources of pollution and reflect the site-specific water quality needs of diverse aquatic ecosystems will achieve our water quality goals. If the main emphasis is mechanically placed on technological approaches or one-size-fits-all planning systems and best management practices, we will not only fail, but we will have misspent billions of dollars in the process.

WATERSHED PLANNING

As S.1114 recognizes in its provisions for watershed planning, these objectives require new institutional arrangements, ones that recognize that nonpoint source pollution control is a vital element of watershed planning. No city in the Nation is more committed to watershed planning than is New York City. Under the Dinkins Administration, a watershed-wide ecosystem planning approach has guided the City's extensive drinking water and harbor-estuary policies. I would like to discuss that experience, highlighting our agricultural program, and then comment on S. 1114, particularly as it addresses nonpoint source controls.

A) Drinking Water Protection

Under New York State law, New York City's watershed regulations are state law in its two upstate watersheds—the Croton and Catskill-Delaware systems—which encompass 19 reservoirs and over 1900 square miles, an area nearly the size of Delaware. These watersheds are the source of drinking water for nine million consumers each day—about half New York State's population. Nearly one million of these consumers reside upstate, while the remaining 8 million reside or work in New York City. The City's drinking water supply is of such exceptionally high quality that it often wins contests. To protect this rich natural bounty, the Dinkins Administration, in cooperation with the State, and local upstate governments and citizens, is implementing a comprehensive watershed protection plan.

In developing its comprehensive watershed protection strategy, the City has emphasized two fundamental ingredients. First, wherever appropriate, the City's watershed protection plans reflect the view that the best management of the land and water resources encompassing major drainage systems will occur not through fiat but with the active participation and cooperation of states, localities, regulated entities and citizens. Second, the City is focusing on pollution prevention and reduction, rather than regulation for its own sake. Thus, the City is pursuing a program whereby its regulatory structure sets the environmental targets but can be administered flexibly—or even waived—if the City's environmental objectives can be more readily or less onerously achieved through locally-based nonregulatory approaches.

The City's revised and enhanced watershed regulations place stringent controls on septic tank installations, stormwater and wastewater treatment plant discharges, development in environmentally-sensitive areas, the storage of petroleum and hazardous materials, the use of pesticides and fertilizers, the disposal of snow, and the protection of stream corridors through vegetative buffer zones and other means.

A similar regulatory structure was considered for agriculture. These proposals were met with immediate and vociferous resistance from the farm community, which claimed that the draft regulations would drive many farms out of business. After initial review, the City was satisfied that these objections, though perhaps overstated, had merit. Recognizing that good farming techniques can both preserve land and yield economic benefit, the City, with the indispensable assistance of the Department of Agriculture and Markets as facilitator, created a watershed agricultural task force to review the City's draft watershed regulations. After a year of discussion and mutual education, the task force, which was comprised of farmers and representatives of local and City government, agreed on a watershed agriculture strategy with the following key components:

- Withdrawal of the City's draft agriculture regulations, except for provisions against willful polluters and increased pollution loading, and substitution of the regulations with a "Whole Farm Planning" program. Whole Farm Planning involves the analysis of pollution sources and the development of plans to implement best management practices uniquely tailored to fit each farm's topographical conditions and business practice. These activities are conducted by a county project team comprised of local farm institutions;
- Targeted City Funding of the programs and best management practices, beyond any cost-sharing programs available through Soil and Water Conservation Districts;
- Voluntary participation by individual farmers, coupled with a pledge by watershed agricultural leaders that unless 85% farmer participation is obtained within five years, the City can reinstate agricultural regulations. The program is to be formally evaluated in 1997;
- Establishment of a Watershed Agricultural Council representing State, City, local government agencies, and the farm community, to monitor and assist the program;
- Development by Cornell University water quality and agricultural experts of new best management practices specifically targeted to Safe Drinking Water Act concerns, such as pathogen control.

Today, thanks to Whole Farm Planning, watershed farmers and the City are enjoying the first collaborative relationship in a hundred years. The Agricultural Council meets on a regular basis, and Phase I of the projects, involving ten pilot farms and the development of a new set of best management practices to control pathogens, is well underway. City funding for Phase I totals \$3.4 million dollars.

We can share three lessons from the program to date. First, to reiterate, be firm with goals but flexible as to means. It has been the willingness of the farm community to accept the City's water quality goals that has enabled the City to allow the proposal of a locally-managed program to attain those goals. Second, local stakehold-

er leadership is crucial. I cannot praise strongly enough local farm leaders, such as Howard Nichols and Bill Murphy, and the determination of State Agriculture and Markets Commissioner Richard McGuire and Deputy Commissioner Dennis Rapp to make this program succeed and to take the real political risks necessary to realize that goal. Third, bringing together diverse stakeholders, often with conflicting interest, requires defusing rhetoric and establishing a common language. For example, farmers were absolutely determined that the program should be voluntary. Environmentalists and regulators believed a voluntary program would fail to produce sufficient progress. In the end, we resolved this conflict by recognizing the legitimacy of both perspectives. Thus, as I described earlier, the program is voluntary but sets an overall participation goal of 85% that the farm community has agreed to attain.

The success to date of Whole Farm Planning has sparked broader discussions between the City and a quasi-governmental organization of watershed community leaders, known as the Coalition of Watershed Towns. Several working groups within the Committee are examining a variety of issues and methods of City-watershed town collaboration. From these discussions a new concept, called "Whole Community Planning," has emerged. Whole Community Planning involves local watershed communities, often ones that have been resistant to zoning and other planning initiatives historically, in charting environmentally-appropriate growth and protecting local water resources from pollution and the perils of unrestrained development.

In return for the active participation of these communities, the City is considering providing assistance to communities with approved whole community plans meeting specified environmental criteria, such as variances from certain otherwise applicable regulations and funding for certain of the best management practices or infrastructure improvements that approved plans may prescribe. Many of these improvements will benefit both water quality and local communities simultaneously. Although Whole Community Planning is in its early stages—five towns have either received start-up funding or signed on as pilot towns—its great potential is apparent.

In connection with Whole Community Planning, the City is involved in a range of other collaborative projects. We are working on programs to clean and upgrade private septic systems and to arrange septage disposal at strategically-located treatment plants throughout the watershed. The City is also working with local environmentalists and anglers to promote stream corridor protection through streamside planting, and with local schools in stream monitoring projects. Overall, the City has committed \$120 million in its ten-year capital budget for future watershed protection participatory programs.

We believe that collaborative efforts that protect both water quality and local interests, such as Whole Farm Planning and Whole Community Planning, can be the future of watershed planning and nonpoint source pollution control. To complement these collaborative ventures, however, the City is taking several independent actions.

A key component of nonpoint source pollution control programs must be the protection of environmentally-sensitive lands, starting with wetlands, which provide a variety of natural filtration benefits, and, if necessary, land acquisition. The City has budgeted \$47 million for upstate land acquisition alone this year, and plans to commit, over the remainder of the decade, as much as \$150-200 million more, depending on a variety of factors, for the acquisition of areas around reservoirs and stream corridors, and for the protection of wetlands and other environmentally-sensitive lands. This important nonpoint pollution prevention initiative should have the assistance of SRF funding. In areas without whole community planning, we are also conducting tightly-directed reviews of proposed land development and filing suits when necessary to enjoin chronic discharge violations and unauthorized, environmentally-insensitive development.

The City is backing up its watershed programs with science as well. We are undertaking a GIS-based characterization and assessment of the entire watershed. This data will assist the Department in conducting comprehensive analyses of reservoir and tributary water quality, soil and slope conditions, proposed development impacts, and various nonpoint source pollution attributes, as well as improved enforcement of our regulations. All of this information will be made available to interested watershed communities and other agencies for their own analyses and planning.

Together, these and a variety of other watershed protection efforts too numerous to mention, comprise what is probably the largest municipal watershed protection effort in recent history. The City has hired hundreds of staff and committed hundreds of millions of dollars over the next decade to watershed planning, because the Dinkins Administration is committed to a water quality strategy that aggressively

controls point and nonpoint source pollution, that emphasizes anti-degradation, and that is preventive rather than reactive.

B) Harbor and Estuary Protection

The nation's estuaries are complex and imperiled natural systems that do not conform to political boundaries. Their preservation often requires interstate and, sometimes, international cooperation. Pursuant to section 320 of the CWA, New York and Connecticut have undertaken a management study of the Long Island Sound, whose waters they share. A similar cooperative program, focusing on New York/New Jersey Harbor, has been developed by New York and New Jersey, with the participation of other stakeholders. The urbanization of the Tri-State region has severely impacted these harbor-estuary waterways and directly contributed to the loss of wetland resources and other sensitive habitats. In addition, land use changes in coastal and upstate regions of these watersheds have resulted in increased nonpoint source pollution loadings.

The contributions of nutrients, such as nitrogen, have been of immediate concern. In addition to nutrients, however, extensive monitoring and analysis has shown that nonpoint source loads to tributaries account for a significant proportion of the organic enrichment, suspended solids, and metals in these estuarine systems. The City is participating in the development of management plans for these estuaries that, through the implementation of innovative strategies, will prevent, and ultimately reduce, pollution loadings. These strategies will use as a starting point ongoing nonpoint source control efforts, including erosion and sediment controls and stricter emission controls under the Clean Air Act. By contrast, costly technological approaches, such as reconstructing wastewater treatment plants, can be financially wasteful and environmentally unsound.

COMMENTS REGARDING S. 1114's WATERSHED PLANNING AND NONPOINT POLLUTION CONTROL PROVISIONS

New York City strongly endorses S. 1114's emphasis on watershed planning and management controlling nonpoint source pollution.

- To be truly effective, the Act's watershed planning provisions should set forth a process that emphasizes site-specific management strategies and enables maximum organizational flexibility. We must encourage local initiative and beware of processes that simply repackaged current water pollution control policies and procedures under a more attractive name or that turn watershed planning into an additional bureaucratic process and leave the Act's current point source biases in place. If we fail to be bold and innovative, decisions will continue to be made in a rigid, top-down manner and opportunities for truly effective collaborations, based on mutual interests, will be lost. In addition, consistent with site-specific watershed planning, the Act should allow flexibility in the attainment of water quality standards. In some instances, for example, ten years may be too little time; in others, too much time.
- We support S. 1114's mix of economic incentives with enforcement mechanisms, i.e., linking grant and loan eligibility to the development of plans and requiring the use of BMPs when plans are not approved. We believe the combination of nonregulatory with regulatory approaches is yielding the most effective results in New York City's watershed protection efforts and should be followed, to the extent possible, on the national level.
- As the recent outbreak of cryptosporidiosis in Milwaukee demonstrated—an outbreak that affected hundreds of thousands—the need to protect the Nation's drinking water supplies cannot be overstated. Although more stringent drinking water regulations have emerged in response to public health concerns about toxics and microbial pathogens, the Clean Water Act's policies have failed to keep pace. One of the most pressing challenges facing the Congress, therefore, is to harmonize the Clean Water Act's and the Safe Drinking Water Act's policies. This priority should be described in the Act's statement of goals and policies and should be reflected much more strongly throughout the Act's policy provisions, especially in the water quality criteria and standards, anti-degradation and outstanding national resource water provisions. In particular, the Act should require the implementation of stringent water quality controls that ensure levels of protection for drinking water supplies that are consistent with the Safe Drinking Water Act's policies, special protection for unfiltered drinking water supplies, and the development of standards for microbial pathogens of recognized public health concern, where such standards have not already been developed.

- Watershed management should be aimed not simply at the attainment of water quality standards in the water column but at use impairments and the development of strategies that will protect and restore whole ecosystems, including wetlands and coastal habitats. The Act must pay much more attention to land-water interaction, to littoral zone preservation, and to expanding public access to our Nation's waters.
- Comprehensive basin wide management requires an understanding of the full spectrum of water quality impairments—point, stormwater, and nonpoint alike—and how they interact. It should be a tool that leads to regulatory and policy simplification and prioritization. In its current form, S. 1114 would seem to create a discrete set of watershed protection requirements that will not necessarily take account of separate but related water quality activities. For example, it is not clear how, if at all, harbor-estuary programs developed pursuant to section 320 would be linked with watershed planning activities.
- The Act should provide enough flexibility to enable watershed decision making that can direct resources where they will yield the greatest return, whether on anti-degradation measures to protect pristine waters or on pollution controls for waters with the greatest use impairments.
- Effective control of nonpoint source pollution requires a greater understanding of nonpoint sources. A serious, federally-assisted research effort is needed in order to improve nonpoint source monitoring techniques and to develop reliable, accurate methods of predicting the effectiveness of various nonpoint source management techniques.
- New York City strongly supports maximizing linkages and coordination between the Clean Water Act and related federal statutes, including the Coastal Zone' Management Act, the Intermodal Surface Transportation Efficiency Act, Soil and Conservation and Domestic Allotment Act, the Food Security Act of 1985, the Clean Air Act and, as stated above, the Safe Drinking Water Act.
- The eligibility of Animal Waste Facilities for Title VI funds for planning and construction is a welcome amendment to section 319 programs. New York City's experience with its watershed farmers is proving that animal waste management, particularly for dairy cattle manure, is an essential element in nutrient management and pathogen control to protect the integrity of the City's drinking water supplies. This provision should be broadened to include funding for multi-farm, or watershed-wide animal waste handling facilities and programs, including regional composting, which in many instances may be more efficient, cost effective, and less labor intensive for individual farmers than on-farm waste management.
- The proper maintenance and operation of individual subsurface disposal systems is crucial to the overall control of nonpoint source pollutant contributions to surface drinking waters supplies, such as New York's. Particularly in economically distressed rural communities, but also in older town centers and more urbanized areas of our watershed, we've found that failed and poorly maintained septic systems are a major threat to water quality. These communities need technical, administrative and financial assistance in establishing septic maintenance districts and remediation programs. The amendment to section 319 relating to Subsurface Sewage Disposal is long overdue. New York City strongly supports federal assistance to watershed communities, particularly in the form of low interest loans and grants, in establishing and implementing subsurface sewage disposal organizations.
- The Act should expand on the progress that has been made under the National Estuary Plan of 1987. New York City urges Congress to support the important regional and local estuary planning efforts now in development. Efforts under section 320 should receive funding for implementation, and provision should be made to extend the duration and funding of those programs where more complex estuarine systems are being studied, such as the Long Island Sound Study (LISS) and the New York New Jersey Harbor Estuary Program (NYNJHEP).

OTHER PRIORITY ISSUES

A) Funding

The high costs of meeting the nation's unmet wastewater treatment needs is well documented. The City urges Congress to support and expand funding of the State Revolving Loan Fund to enable a wider variety of activities essential to meeting the Act's clean water goals. A minimum of \$5 billion in funds should be available to fund any and all activities required for compliance with the Clean Water Act's requirements, including nonpoint source controls, combined sewer overflow programs, nutrient removal, comprehensive watershed protection, wetland protection, water

pollution control facilities upgrading, and water conservation. It is also essential that funding be provided for basic scientific research and to support local programs to minimize pollution discharges and control floatables. It is also finally time to expand the Land and Water Conservation Fund and other programs to enable the acquisition of environmentally-sensitive lands.

Unfunded federal water mandates have caused rate shocks in municipalities across the Nation. Rate shocks hurt low income consumers most severely. Since 1986 alone, New York City's rates have increased over 200 percent. We applaud S. 1114's attempt to address this issue but urge the Congress to provide grants for municipalities with high wastewater needs in addition to SRF loans. By stimulating the economy, grants would provide economic as well as environmental benefit.

B) Combined Sewer Overflow Control

New York City supports an approach to combined sewer overflow (CSO) and stormwater control that, reflecting current thinking about watershed planning, is based on site-specific water quality targets, rather than uniform technology requirements. It is essential that local governments be provided the flexibility to achieve water quality, best use classifications, and actual waste load allocations. We believe that the EPA's draft CSO Control Policy, which is the indirect product of negotiations among a wide range of interested parties, will enable such flexibility and should not be disturbed by the reauthorization process.

C) Wetlands Protection

Wetlands protection is an essential element of comprehensive water quality management. To protect the nation's imperiled wetlands, at a minimum, Section 404 of the Act should be broadened to incorporate a "no net loss to wetlands" policy and the activities regulated must be expanded to include drainage, channelization, excavation, and activities that impair the flow, extent, and circulation of the nation's waters. In the case of freshwater wetlands, the quality of the City's drinking water is closely linked to the biological purification actions of these natural systems. If they are degraded or destroyed, the drinking water of nine million will be jeopardized.

Mr. Chairman, thank you for the opportunity to testify before the Subcommittee today. I would be pleased to answer any questions.

TESTIMONY OF GEOFFREY GRUBBS, DIRECTOR, ASSESSMENT AND WATERSHED PROTECTION DIVISION, ENVIRONMENTAL PROTECTION AGENCY

Good morning, Mr. Chairman and Members of the Subcommittee. I am Geoffrey Grubbs, Director, Assessment and Watershed

Protection Division of the Office of Water at the United States Environmental Protection Agency (EPA). Thank you for the opportunity to testify on one of the most important water quality challenges facing all of us—management of nonpoint sources including polluted runoff. As Carol Browner noted in her recent testimony before this Subcommittee, if we collectively assure better nonpoint source management through a reauthorized Clean Water Act (CWA), the legislation will be a success.

First, let me note that many aspects of the CWA and of S. 1114 relate directly or indirectly to nonpoint source management. Funding, watershed planning, pollution prevention, and stormwater controls are all relevant here, and we should take care that approaches in these related areas complement and reinforce any new nonpoint source directions. I will provide more information on this later in my testimony.

I will first provide a little background on the nonpoint source problem. EPA and the State water quality agencies are proud of the fact that most of our rivers, lakes, and estuaries are now meeting their environmental objectives. In April 1992, States reported to EPA on the quality of this country's vast waterways. In the two years preceding their reports, States were able to assess nearly 774 thousand miles of rivers and streams, over 18 million acres of lakes, and over 27 thousand square miles of estuaries. The States indicate that two-thirds of these rivers, streams and estuaries and over half of these lakes meet State water quality standards and designated uses.

Nevertheless, our remaining problems are quite extensive. Of the assessed waters, States report that over 258 thousand miles of rivers and streams, nearly 8 million acres of lakes, and over 9 thousand square miles of estuaries do not meet water quality standards or their designated uses.

While point source discharges continue to cause problems in some areas, nonpoint source pollution including polluted runoff remains the dominant water quality and environmental concern in most areas. For the last decade, States and others have consistently reported that nonpoint source pollution is the main reason that water quality objectives are not met. In their 1992 reports to EPA, States once again confirmed that nonpoint sources are causing extensive water quality problems. States list agriculture, urban runoff and stormwater, resource extraction, hydrologic modifications, and contaminated sediments among the sources most widely contributing to water quality impairments nationwide. Depending on local conditions and economic activity, other nonpoint sources—such as land disposal (including on-site wastewater systems), forest harvesting, and small construction sites—can also be significant contributors to water quality problems. The leading causes of impairment related to nonpoint sources are siltation, nutrients, and organic enrichment.

States have reported that the most widespread nonpoint source category of concern is agriculture, which adversely affects about two-thirds of all impaired river miles. Similarly, agriculture contributes to about one-half of all impaired lake acres reported by the States. The United States Department of Agriculture's (USDA's) second Resource Conservation Act appraisal of conditions and trends on non-federal lands reported that agricultural nonpoint sources of pollution are degrading water quality in about 10 percent of all streams. Many studies have documented that agricultural nonpoint source pollution also affects ground water. For example, high nitrate concentrations from agricultural areas have been detected in the ground water of the Central Great Plains, the cornbelt, the Palouse and Columbia River basins, as well as parts of Montana, Arizona, Pennsylvania, Maryland and Delaware.

Urban and stormwater runoff, including certain construction and development activities and on-site disposal systems, contributes conventional and toxic pollutants to our waters.¹ This runoff is the leading water quality problem in estuarine waters, affecting over two-fifths of impaired estuary square miles according to State 1992 Section 305(b) reports. The National Oceanic and Atmospheric Administration (NOAA) has documented that well over 1.5 million acres of Gulf, East and West coast waters are limited for shellfish harvesting due to urban runoff. EPA and the States have begun efforts to control stormwater from larger cities and industrial activities (including major construction projects) through the National Pollutant Discharge Elimination System (NPDES) permit program of the CWA. Runoff from smaller urban areas and commercial, retail, and light industrial facilities is currently managed as a nonpoint source, but these sources are scheduled to become subject to NPDES permit requirements in October 1994. As described in EPA's earlier testimony, we support an approach similar to that set forth in S. 1114 that would move these sources over to a strengthened nonpoint source program indefinitely.

Beyond urban and agricultural runoff, States have reported significant impacts from other nonpoint source categories. For example, four States—Washington, Tennessee, Idaho, and North Dakota—list hydrologic and habitat modification as accounting for more than 20 percent of the nonpoint source impacts to their rivers and streams. Another 22 States reported lesser but still significant impacts from hydromodification. Seventeen States said forestry (silviculture) contributes to their nonpoint source problems in rivers.

Not only the chemical, but also the physical and biological components of aquatic ecosystems, are important to maintaining the integrity of our Nation's waters. For example, urbanization and development can severely alter the natural vegetation and infiltration characteristics of watersheds and their wetlands, causing higher and more frequent runoff with subsequent downstream erosion, riparian alterations and destruction of habitats. Rivers and streams are increasingly affected by temperature stress, caused primarily by loss of streamside vegetation that provides shade, and by channelization and hydromodifications (e.g., dams and flow alteration).

States have made progress in nonpoint source management since the addition of Section 319 in the 1987 Clean Water Act amendments. All States have developed and started implementing Section 319 nonpoint source management programs. Since FY 1990, EPA has provided about \$190 million in Section 319 funds to help States with their nonpoint source management activities. State efforts have led to increased public awareness of nonpoint source pollution including polluted runoff and ways to manage the problem sources. State 319 programs have demonstrated

¹ Combined sewer overflows (CSOs) discharge pollutants from raw domestic sewage, industrial and commercial wastes, and storm water runoff. CSOs contribute to water pollution problems in older cities (primarily in the Northeast and Great Lakes) where such combined sewer systems still exist. EPA's draft strategy for CSO controls was discussed at an earlier hearing in the Subcommittee's review of Clean Water Act reauthorization issues.

the effectiveness of a variety of innovative management practices, established viable institutional arrangements, and implemented some watershed projects. States have also worked with other federal agencies to better use the existing array of natural resource programs to support nonpoint source management. Support from the USDA, the U.S. Department of Interior (DOI) and NOAA has helped EPA do its job, buttressed State nonpoint source programs, and led to many localized watershed improvements.

In addition, the Coastal Zone Act Reauthorization Amendments of 1990 (CZARA) provided a strong mandate to address nonpoint sources in coastal areas. Twenty-nine coastal States and Territories are developing coastal nonpoint pollution control programs for approval by NOAA and EPA. These programs will substantially reduce polluted runoff associated with agriculture, forestry, urban activities, marinas, and hydromodification through the application of best available management measures that are economically achievable. State-adopted and locally appropriate management measures must conform to the national nonpoint source guidance published by EPA after close collaboration with other federal agencies and States, and consultation with the potentially affected sources and the public. These new State coastal nonpoint programs will also provide for the implementation of additional measures as necessary to attain and maintain water quality standards and designated uses. The coastal nonpoint programs represent an important forward step in controlling nonpoint source problems.

Yet, despite progress under Section 319 and the promise of CZARA, the problems of nonpoint source-related impairments are so widespread that State programs must advance even further. Existing State programs under Section 319, while generally providing a good, basic framework, need to be upgraded. While EPA and States are working to improve Section 319 implementation, stronger authority is needed if we are to make the progress required. We believe that the following principles should guide reauthorization in this area:

- provide a stronger watershed framework;
- continue to focus on voluntary, targeted approaches, but supplemented by backup enforceable requirements to be triggered when necessary;
- establish clearer performance expectations and technical baselines;
- focus water quality programs on aquatic ecosystem protection, not just on the water column;
- stress pollution prevention; and,
- work with other federal agencies to provide for implementation through their stewardship of federal lands.

I would like to discuss the Administration's view on possible approaches to these challenges, including general areas of agreement with S. 1114 and a number of ideas for improving its effectiveness.

STRENGTHENING STATE PROGRAMS

Section 319 gives States the leadership role in controlling nonpoint sources, including significant flexibility to devise and carry out their own nonpoint source management programs. Given the differing and localized nature of nonpoint source problems, this flexibility appropriately provides for nonpoint source programs to vary across the country according to local needs. States have used this flexibility to focus on their specific priority problems, targeting and tailoring their projects and available Section 319 funds to complement other State and federal funding and authorities.

However, with initial State nonpoint source programs in place, it is apparent that the differences in State programs go beyond those justified by local conditions. For example, States do not share an understanding of the baseline management measures that are available, and there is no generally agreed upon schedule to guide State progress. There is no basis in Section 319 for gauging the success of State nonpoint source programs nor for EPA to step in where States fail to act, no matter how severe the water quality problem may be. While most States are implementing several nonpoint source watershed demonstration projects, adoption of nonpoint source controls is not nearly as widespread as needed to reduce the extensive water quality problems States report as resulting from nonpoint sources. EPA continues to believe that voluntary approaches should be reinforced and relied upon as the strategy of first choice, but the current Section 319 gives us no mechanism to assure success where voluntary efforts fail.

Section 319 should be amended to bolster State nonpoint source programs in concert with a watershed protection approach. As part of a watershed protection approach, States should specifically identify those waterbodies and their watersheds

that are impaired or threatened by nonpoint sources. In this respect, we agree with S. 1114 that existing State assessments should be updated and should include delineations of the contributing watersheds, although we would add that these assessments should also cover threatened waters and include major relevant stresses on ecosystems in addition to chemical pollutants. To reduce State paperwork burdens and duplication, these assessments should also be consolidated with existing inventory requirements under CWA Sections 305(b), 303(d) and 314(a). Where States comprehensively inventory their watersheds and undertake strong, broad programs to expeditiously address the stresses in the highest priority areas, we would support deference to that program. States could thereby adopt their own nonpoint source management measures for the sources and pollutants causing problems on a local basis as part of a comprehensive watershed approach. However, not all States are ready to adopt this approach.

In impaired or threatened areas where States do not opt for a watershed approach, existing nonpoint source management programs should be upgraded to implement best available management measures for categories of nonpoint sources causing or contributing to water quality impairments (or threatening such impairments). These State measures should be based upon EPA national minimum program and management measure guidance, which in turn should consider costs and the pollution reductions achieved and encourage pollution prevention wherever appropriate. The guidance should be broad and flexible enough to allow for appropriate local tailoring. States should also be allowed to adopt alternative management measures if they can demonstrate that the alternative is as effective as the measure in national guidance.

Additional protection beyond impaired and threatened waters is necessary as well to make sure that water quality standards (including designated uses) are maintained. We therefore favor the application of best available management measures to all new nonpoint sources except in areas where a State has developed a watershed program.

We agree with S. 1114 that some flexibility is appropriate for site-level implementation of national nonpoint source management measures and we support site-specific plans, developed and approved by a qualified federal or State agency, and designed to manage nonpoint pollution, as an appropriate alternative. However, we are concerned about deferring in all cases to existing agricultural conservation compliance plans as S. 1114 does, since these plans are intended to address soil loss, not water quality. Where the water quality impairment relates to nutrients or pesticides, these pollutants must be addressed in site-specific plans, and conservation compliance plans may not fully suffice. These site specific plans, required to be fully implemented by 1995 for all farms with highly-erodible lands, could be augmented when considered in concert with certain existing programs that do address the specific pollutants and land areas affecting water quality. Such programs could include the Conservation Reserve Program established under the 1985 Farm Bill, and the water quality incentive program established under the 1990 Farm Bill, and State coastal nonpoint programs approved by NOAA and EPA under CZARA, as well as conservation compliance plans.

In implementing best available management measures, we agree with S. 1114's general philosophy that States should rely initially on an appropriate mix of voluntary and regulatory approaches. However, upgraded State programs should also include compulsory mechanisms, including enforcement authorities, to be triggered if, within a reasonable time, voluntary means fail to result in implementation of the management measures.

S. 1114 envisions a twelve and one-half year time frame for implementing enhanced nonpoint source controls: thirty months for new State programs plus two five-year cycles for implementation. We think this two-cycle approach and time frame is reasonable, but that the requirements should be phased in based on a State-developed schedule. However, we note that the second cycle of the program (in years eight through twelve) does not provide for additional steps which might still be necessary to meet water quality standards in impaired waters despite the application of the management measures described in national guidance. The second cycle of State nonpoint source programs should provide for additional State management measures as necessary to meet water quality standards and designated uses.

We support S. 1114's provision for withholding Section 319 grants from States that do not adopt revised, approvable nonpoint source management programs. We also support the provision in S. 1114 which would authorize the EPA Administrator to establish enforceable minimum nonpoint source controls where a State has failed to develop an approvable program.

FUNDING AND FINANCING

EPA estimates that the total capital cost nationally to implement nonpoint source management measures for agriculture and forestry would be about \$8.8 billion over the next 20 years. (We have not yet estimated the capital costs for the more targeted approach we are supporting today, but the cost should be lower.) Operation and maintenance costs have not been estimated, nor have needs for such nonpoint sources as hydromodification or stormwater runoff from small communities and light industry, which are expected to be significant.

The benefits of nonpoint source pollution control appear to be significant. In 1985, the Conservation Foundation estimated in-stream damages from cropland erosion to be \$2.5 billion annually and total in- and off-stream damages to be \$3.5 billion annually (this estimate does not include damage to water quality from animal waste, fertilizer, pesticides, grazing, irrigation or non-agricultural nonpoint sources). A variety of other studies corroborate that the benefits of nonpoint source pollution control would significantly exceed its costs.

Since FY 1990, Congress has appropriated approximately \$190 million in Section 319 funds to assist State nonpoint source programs. These funds are being used by States and Indian Tribes to carry out their programs and do provide direct support for implementing nonpoint source controls in priority watersheds. Several other EPA programs provide limited funding to assist nonpoint source implementation, including the Clean Lakes Program, the National Estuaries Programs, and the Great Lakes and Chesapeake Bay programs.

Other federal agencies provide significant financial and technical support for activities that help reduce nonpoint source pollution problems. For example, as a result of the 1985 and 1990 Farm bills, approximately 1.5 million Conservation Compliance Plans covering 140 million acres are being developed by USDA to reduce soil loss; such plans are now fully implemented on 78 million acres. Similarly, the Conservation Reserve Program implemented by USDA has resulted in removing from production 36.5 million acres of cropland that pose particular threats of soil erosion, while the Wetlands Reserve program has signed up 50,000 wetlands acres whose retention can significantly improve water quality. Also, annually the Agricultural Conservation Program provides cost share assistance to producers to install improved management practices. In 1992, some 9.5 million acres were affected.

The mandates of the CWA must be realistic in light of the resources we can reasonably expect to be available to federal, State and local governments and the private sector. For this reason, we support careful targeting of funds to priority watersheds and impaired and threatened waters. At the same time, States and federal agencies will need to continually evaluate their assistance approaches to ensure that limited resources are used in the most cost-effective manner possible.

However, even with targeting and streamlined approaches, we believe additional resources will be needed at the federal, State, and local levels to fully address the considerable national nonpoint source pollution control needs. Current Section 319 appropriation levels are providing States and Indian Tribes with base program assistance but are not adequately supporting nonpoint source watershed implementation projects. Therefore, in addition to the \$50 million per year currently being appropriated for nonpoint source grants, the President is proposing to invest an additional \$180 million in nonpoint source grants from FY 1994 through FY 1997.

The current one-third of one percent CWA cap on Section 319 grants to Indian Tribes (resulting in a total of \$165,000 in FY 1993) is hindering our ability to assist Tribes in developing and implementing their nonpoint source programs; we support raising this limitation.

We note that S. 1114 would eliminate the provision for EPA to consider groundwater protection activities such as planning, assessments, and technical assistance when awarding Section 319 grants to States. It is important to avoid transferring problems from surface to ground water and to protect ground water from nonpoint source pollution. We believe the existing provision has worked well, allowing States to foster nonpoint source related priority ground-water activities. We would favor keeping this existing provision.

Under the CWA, nearly \$9 billion has been appropriated to date for State revolving loan funds. In addition to supporting construction of wastewater facilities, these funds may be used for loans to individuals or municipalities to implement nonpoint source controls consistent with a State's Section 319 nonpoint source management program. However, to date, only a very limited amount of these funds have been used to address nonpoint sources.

We support retaining the existing revolving fund eligibility for nonpoint sources for projects whose principal purpose is protecting and improving water quality to

encourage States to use these funds to support their priority nonpoint source projects. Also, as more States begin using their revolving funds for nonpoint sources, other public entities not traditionally involved in providing municipal pollution control will necessarily need to participate in this loan program. We should explicitly recognize these entities, including Conservation Districts.

FEDERAL LANDS AND ACTIVITIES

Over 29% of the land in the United States, 701 million acres, is public land, administered by the U.S. government for various purposes through the Bureau of Land Management, the Forest Service, the Park Service, the Fish and Wildlife Service, the Department of Defense, and other federal agencies. In addition, many federal agencies, such as the Federal Energy Regulatory Commission, the Army Corps of Engineers, the Bureau of Reclamation, the Bureau of Land Management and the Forest Service issue licenses and permits and fund or conduct activities that can, if conducted improperly, result in nonpoint source pollution.

As good stewards, the federal land managers and decision makers should ensure that federal lands and activities are properly managed to substantially reduce nonpoint source pollution. In particular, federal lands contain many of our most sensitive waters (e.g., cold-water fisheries, habitat for threatened and endangered species, etc.), serve as watersheds for drinking water supplies, and contain high-quality and outstanding resource waters.

We believe the current consistency provision in Section 319 should be strengthened by requiring States to identify, for their priority watersheds or their threatened and impaired waters, the federal lands and federal activities that are inconsistent with the State nonpoint source management programs. Federal departments and agencies should achieve consistency with State programs in these areas to the same extent as non-federal entities are required to do. As a minimum, federal agencies should comply with management measures in watersheds to the same extent as non-federal entities in those watersheds. However, we also believe that the President should have the ability in individual cases to waive these requirements if the President determines it to be in the paramount interest of the United States to provide an exemption.

CONCLUSION

Polluted runoff poses a challenge that federal agencies, States, local governments, and the private sector must meet if we are ever to realize the full promise of the CWA. The problems are different and more subtle than those of the past, but they are not insurmountable. Public education, clear definition of good practices, and a commitment by State and federal agencies to water quality values will carry us a long way. We thank Senators Baucus and Chafee for the thoughtful approach reflected in S. 1114 and we hope our suggestions will help to strengthen that approach while remaining generally compatible with it.

I will be happy to answer any questions that you and other members of the subcommittee may have.

TESTIMONY OF DIANE M. CAMERON, NATURAL RESOURCES DEFENSE COUNCIL

I. Summary

Poison runoff impairs more waterbodies, surface and ground, urban and rural, than any other pollution source in the country. Poison runoff is the contaminated stormwater and snowmelt that runs off of, or leaches through, land used and abused for human purposes without regard to ecological needs. Although the dominance of poison runoff ("nonpoint source water pollution") as a water quality problem is widely acknowledged, (and was known even before 1972), in general we have failed to create and implement effective programs that protect and restore our nation's waters that are subject to this threat.

The framers of the 1972 Clean Water Act explicitly recognized the need for State water quality programs to address land-based sources of water pollution in their water quality assessments and in their watershed management plans developed under section 208 of the Act ("208 Plans"). The dominance of the "point source challenge," however, eclipsed public awareness of, and government attention to, more diffuse pollution sources.

By the mid 1980s, impatient with the lack of EPA and State progress in controlling poison runoff, Congress created the "State Nonpoint Source Management Pro-

gram" (§ 319). Unfortunately, the State 319 programs have been plagued by slow and inadequate funding, lack of adequate implementing mechanisms, and insufficient direction and oversight from EPA. The 1987 CWA Amendments also included requirements for the municipal and industrial stormwater permits; these permitting programs are now helping to revive public interest in restoring blighted urban watersheds into oases of life. In 1990, Congress passed a new program, aimed at reducing poison runoff in coastal watersheds, with a more ambitious pollution reduction mandate and more regulatory clout than the 319 program. The "Coastal Zone Nonpoint Source Pollution Control Program" may be a model for revisions to State runoff and watershed management programs that will help to reduce and prevent poison runoff.

To underscore the severity of the poison runoff problem, and to explain it to the uninitiated, we begin this section with a poison runoff primer. Next, we evaluate the implementation and efficacy of Clean Water Act poison runoff programs that existed before 1987, as well as the two major initiatives passed in 1987 (§ 319) and in 1990 (the Coastal Zone Management Act). We then apply these various findings about the history of efforts to control runoff in our brief analysis of Title III of S. 1114.

Finally, in relation to the whole-watershed approach within Title III of S. 1114 and in anticipation of the upcoming hearing on watershed planning, we describe the challenges that face urban leaders seeking to restore inner city waters to places of recreation and refreshment, and to provide meaningful jobs in the process of healing urban waters.

II. Introduction to the Problem of Polluted Runoff and Watershed Restoration

A. A Primer on Poison Runoff

Poison Runoff Problems Were Brought Here by the Pilgrims

Poison runoff is not a new phenomenon; in fact, it has been with us since the first settlers clear-cut the New England forests, and since the first farmers began plowing the fertile lands of the Eastern Coastal Plain. Reflecting a lack of understanding of history, the official rhetoric has often apologized for the severe lack of money, staff resources, and regulatory clout devoted to poison runoff reduction by claiming that this is a new or obscure pollution source. For example, EPA's Final Report to Congress on Section 319 of the Clean Water Act states,

"Nonpoint source impacts have not been fully assessed. The Nation has focused largely on impacts caused by traditional point sources (POTWs and industrial dischargers) in the past because point source discharges were causing major, visible problems in our surface waters. Thus, very little attention has been given to assessing the impacts of NPSs. Since water quality impacts still exist in many areas, it is now very clear that NPSs have had and continue to have widespread impacts upon surface waters."¹

Contrary to this assertion, land-based, diffuse pollution sources and the severity of damage they caused were well-known to the framers of the original Clean Water Act. The 1972 Senate Report said:

"One of the most significant aspects of this year's hearings on the pending legislation was the information presented on the degree to which nonpoint sources contribute to water pollution. Agricultural runoff, animal wastes, soil erosion, fertilizers, pesticides and other farm chemicals that are a part of runoff, construction runoff and siltation from mines and acid mine drainage are major contributors to the Nation's water pollution problem. Little has been done to control this major source of pollution. . . . It has become clearly established that the waters of the Nation cannot be restored and their quality maintained unless the very complex and difficult problem of nonpoint sources is addressed. . . . The Committee recognizes, at the outset, that many nonpoint sources of pollution are beyond present technology of control. However, there are many programs that can be applied to each of the categories of nonpoint sources and the Committee expects that these controls will be applied as soon as possible."²

Unfortunately, it would be over two decades before any land use category-specific water quality controls were required as part of a federal program—the Coastal Zone Nonpoint Source Pollution control Program—which we will discuss below. In the intervening years, poison runoff continued unabated.

National Statistics Show That Poison Runoff Damages Are Widespread

Two water quality assessment programs required by the CWA include poison runoff: the biennial 305(b) reports, and the onetime 319(a) reports. The 305(b) re-

ports are supposed to cover all waterbodies and all relevant pollution sources in each State; the 319(a) reports are supposed to be statewide assessments of runoff problems, conducted wherever possible on a watershed-by-watershed basis. There is some overlap between these two reports.

The 305(b) water quality assessments are difficult to compile for a time-series analysis of trends, since the scope and methodologies for reporting have changed so frequently. And these reports likely underestimate the magnitude of the poison runoff problem even more than for other sources of pollution because, as discussed below, poison runoff is even more dominated by physical and biological (as opposed to chemical) impairment. The most complete, and thus the most revealing, 305(b) reports on runoff problems were from the most recent (1988-1989) reporting cycle compiled by EPA.

EPA in 1991 published a compendium of the States' 319(a) assessments, entitled *Managing Nonpoint Source Pollution*, as required by § 319(m). This report also contains a comprehensive set of statistics on the role of land-based sources in damaging aquatic resources nationwide. Below we summarize the damage assessment from this report as well as from the 1988-1989 305(b) compilation (The National Water Quality Inventory).

Rivers: Over 100,000 assessed river miles are impaired or threatened by agricultural runoff nationwide. Over 15,000 more assessed river miles are impaired by logging; and almost 10,000 assessed river miles are impaired by construction runoff. About 40,000 river miles were listed in the 319(a) reports as threatened by runoff pollution sources.

Lakes: Almost 2 million acres of U.S. lakes are impaired by agricultural runoff sources. Storm sewers impair almost another million acres.

Great Lakes: All affected Great Lakes areas of Indiana (Lake Michigan) and New York (Lakes Erie and Ontario) do not support designated uses (wildlife-Indiana), (fisheries-New York), attributed in large part to poison runoff sources. (No other Great Lake State provided quantitative assessments of runoff impacts to the Great Lakes.)

Wetlands: About 52,000 acres of wetlands in California, Iowa, and Delaware are not supporting one or more designated uses, or are threatened due to poison runoff sources. (No other States gave quantitative information on wetlands damage from runoff sources.)

Coastal Waters: 1.2 million acres of coastal waters are not fully supporting one or more designated uses due to poison runoff.

Estuaries: About 5,000 square miles of estuarine waters are impaired or threatened by runoff sources.

Groundwater: Public drinking water supplies are threatened by runoff sources in the four States that specified impacts to designated uses.³ Nitrates in groundwater exceed current health standards in virtually all States and occur in 5 to 20 percent of sampled wells in the Western Corn Belt and Mid-Atlantic States, largely due to fertilizer applications on farms.⁴

The runoff management and waterbody assessment programs are not the only source of national statistics on runoff damage. In June, 1989, under § 304(l) discussed above, EPA released a list of over 17,000 "toxic hotspots"—seriously degraded waterbodies. Only 602, or less than 4 percent, were impaired "wholly or substantially" by factories or sewage treatment plants. The rest were polluted, wholly or substantially, by poison runoff from farms and other sources.⁵

B. *The Nature of Poison Runoff Varies by Land Use Category. But Water Quality Damage Tends to Be Systemic. Part of "Business As Usual"*

Virtually every human activity on the land has the potential to impair water quality and aquatic habitat. It is beyond the scope of this report to describe every land use category in detail; we will, however, highlight the most significant categories that do the most damage nationwide: Agriculture (including cropping, confined animal operations and grazing); mining; urban development and logging.

Agriculture Dominates as the Number One Source of Aquatic Impairment, But Farming Practices that Save Money, Protect Water Quality Are Available

Agriculture is the leading source of water pollution in the United States, according to EPA.⁶ Agriculture was cited by EPA as the leading source of pollutants causing or contributing to "toxic hotspots" in its June 1989 release of the list of 17,000 hotspots nationwide.⁷ The latest National Water Quality Inventory (1988-1989) reported that agriculture was far-and-away the largest source of river impairment, serving as a contributing source in over 60% of impaired river miles. For perspec-

tive, the next biggest reported source—municipal sewage plant discharges—contributed to 16.4% of impaired river miles.)⁸

Agriculture is also a leading cause of species endangerment and extinction. About 37% of the 436 species listed in the Endangered Species Information System data base are imperiled at least in part by irrigation and the use of pesticides. An unpublished EPA staff report from November 1989, based on data from the Department of the Interior, identified 125 endangered or threatened species that are aquatic or water-dependent and are impacted by agricultural practices such as pesticide usage.⁹

Agricultural activities were also fingered as a major cause of fish kills. Three out of the top six pollutant categories cited as causing fish kills, low dissolved oxygen, pesticides, and fertilizers, are wholly or substantially from agricultural uses (the other three are petroleum, pH/acidity and organic chemicals). However, agriculture accounted for only 5% of the total number of fish killed from 1977 and 1985, because the size of each fish kill was relatively small. In EPA's 1986-87 summary of State reports on fish kills, animal feedlot/waste operations were blamed for over 1 million fish killed (most likely due to oxygen starvation from manure pollution).¹⁰ In a separate 1984 survey of fish kill data, pesticides were cited as the leading documented cause of fish kills in the U.S. over the previous two decades.¹¹

Because agriculture is by far the biggest source of waterbody impairment nationwide, and because it is such a diverse industry, it is necessary to sub-categorize the industry in order to explain regional differences in the types of impairments observed.

Croplands

Soil erosion, pesticide pollution, nitrates leaching into groundwater, nitrogen and phosphorus runoff into estuaries, wetlands conversion, streambank wastage, and manure runoff are all major problems associated with crop production. Irrigated crop production can be associated with all of these water quality problems, plus the discharge of toxic mineral salts into estuaries and marshlands. Below we give some national and regional data on water pollution from crop production.

Soil erosion data has only been collected on the national level since 1977. The National Resources Inventory, taken roughly every five years by the Soil Conservation Service, includes reports for 1977, 1982, and 1987.

The 1982 and 1987 reports are more reliable than the 1977 reports. Total U.S. soil erosion estimates from sheet and rill (water-borne) erosion from cropland show a decline from roughly 1.8 billion tons of sheet and rill erosion in 1982 to about 1.6 billion tons eroded in 1987—a decline of about 11 percent.

Among the trends in crop production accounting for the decline are the onset of the 1985 Farm Bill conservation program, including the conservation reserve and conservation compliance programs. While a direct connection between soil erosion and water quality cannot be made, in general, the more soil is conserved, the more our waters are protected from sediment pollution. The job of keeping soil on the land is far from over, however. Despite this apparent reduction in erosion losses, sediment and siltation from agriculture and other land uses remains the top water pollution problem in the country.

Pesticides pollute both surface and groundwater. Fish kills from pesticides were discussed above. Overall pesticide use statistics are startling, and give an indication of the magnitude of the potential pesticide problem for water quality. EPA has estimated that approximately 600 active ingredients are marketed in 45,000 to 50,000 formulations. About 430 million pounds of pesticides were applied agriculturally in 1987, with a market value of about \$4.0 billion.¹² According to EPA's compilation of the States' 1988/89 305(b) reports, pesticides impaired 11.2% of all assessed river miles and 14.5% of Great Lake shore miles. (Pesticide impairment of lakes was not assessed, or not reported in this compilation.)¹³

A recent USGS study of ten current-use *herbicides* in surface waters of the Midwest found that high concentrations of herbicides were flushed from cropland and were transported through surface waters as pulses in response to late spring and early summer rainstorms.¹⁴ Several of the herbicides exceeded the EPA water quality criterion for drinking water-human health protection in a significant percentage of the samples. For example, 52% of the sites exceeded the primary drinking water standard for atrazine (3 ug/L); 32% exceeded the WQC for alachlor (2 ug/L); and seven percent for simazine (1 ug/L). The median concentrations of the four major herbicides, atrazine, alachlor, cyanazine, and metolachlor, jumped by a factor of ten in the late spring-early summer samples, and then dropped back to near preplanting levels by harvest time. The study sampled 149 sites in 122 river basins of Ohio, Indiana, Illinois, Wisconsin, Minnesota, Iowa, Kentucky, South Dakota, Kansas, Ne-

braska and Missouri.¹⁵ The fact that over half of these midwestern surface water sites exceeded the atrazine drinking water standard, and a third exceeded the alachlor drinking water standard, is a concern for all communities that rely upon these waters as drinking water supplies, and particularly for those small rural towns that do not use advanced drinking water treatment such as carbon filtration.

The *nutrients phosphorus and nitrogen* are important water pollutants from agricultural operations including manure spreading and artificial fertilizer applications. Phosphorus in high levels is acutely toxic to fish; in much lower levels it over-enriches waterbodies, causing them to fill up with algae ("eutrophication"). Nitrogen, especially in the form of nitrate, is a human health and livestock health concern (EPA's drinking water standard for nitrate is 10 mg/L) because it causes "blue baby syndrome" (methemoglobinemia). Like phosphorus, nitrogen also contributes to eutrophication of lakes and estuaries in much smaller concentrations than those of human health concern. In the form of ammonia, nitrogen is also acutely toxic to fish.

The use of nitrogen fertilizers in the U.S. increased by more than a factor of four in the two decades between 1960 and 1981, to a 1981 total of 11.9 million tons per year. Per-acre use of fertilizers doubled between 1964 and 1984. However, the skyrocketing increase in the use of nitrogenous fertilizers may have reached its apex in the 1980s, and has apparently begun to decline slightly; the total tons of n-fertilizer used declined 12 percent, to 10.5 million tons of annual application, between 1981 and 1988.¹⁶

Long-term trend data for nitrate pollution is scarce. One ten-year study in Nebraska from the early 1960s to the early 1970s, showed a 25% increase, on a state-wide average, of groundwater nitrate-nitrogen concentrations. During that same time frame, nitrogen fertilizer use in Nebraska increased by a factor of four. A longer time-series study on nitrogen pollution from almost 4600 samples from wells all over Iowa showed that nitrate levels in groundwater from shallow wells less than 100 feet deep increased slowly but steadily from 1952 to 1979, where total fertilizer use and per-acre applications were increasing rapidly.¹⁷

Waters in karst (limestone-solution feature) topographies are especially vulnerable to nitrate contamination. In Iowa's Big Springs Basin, part of the Karst region that straddles portions of Iowa, Wisconsin, and Kansas, groundwater nitrate concentrations tripled (from five mg/L to 15 mg/L) from 1958 to 1982. These data suggest a yearly rate of increase of 0.4 mg/L of the average nitrate-nitrogen concentration. A farm survey in the basin in the mid-1980s showed that area farmers were not preparing nitrogen budgets to determine appropriate fertilizer application rates. Where such budgets were prepared, they were incomplete. Alfalfa and manure contributions to soil-nitrogen were being neglected, and thus in 1984 artificial fertilizers were being applied in excess of need at a rate of about 90 kilograms per hectare.¹⁸

Of course, the foregoing examples of nitrate contamination trend data are perhaps from regions with more vulnerable climate and geology, and the problems of nitrate contamination inevitably vary in severity from region to region. Nonetheless, "snapshot8, statistics from single-year national studies show us that nitrate contamination of groundwater is indeed a problem that is national in scope. A 1986 USGS sampling of 316 principal aquifers in 46 States turned up 288 (91%) with median nitrate-n levels below three mg/L; 27 aquifers (8.5%) with median nitrate-n levels between 3 and 10 mg/L; and 1 (0.5%) aquifer with median nitrate-n levels above 10 mg/L. The same USGS study found that 41 (13% of the aquifers) in twenty states had nitrate "hotspots" where greater than ten percent of the samples exceeded the EPA-human health 10 mg/L standard.¹⁹

Conservation practices on the farm, designed to protect soil and water quality, are often easier on the bank book as well. Thus, conservation tillage practices, which are critical to reducing damaging soil loadings into rivers and lakes, also can save farmers both work time, and fuel costs.²⁰ Soil nutrient testing can cut farmers' fertilizer costs significantly.²¹ And a recent study by a group at the University of Iowa found that agriculture and water quality goals may actually be far more compatible than many now perceive. The Iowa researchers found that, for several policy options for reducing agriculture's impact on water quality including regulation and research and education,

... the effects on water quality and profitability suggest that water quality can be significantly improved without losses to farm profitability. there is not necessarily a direct tradeoff between water quality and profitability. Improvements to both can be achieved simultaneously and, in some cases, without high implementation costs borne by taxpayers or farmers."²²

Manure management stands out as perhaps the most costly water-quality practice for most agricultural regions, and more work needs to be done to research cost-effec-

tive manure management techniques. As one farm researcher has observed, our agronomic universities need to

“stop funding research in animal-based agriculture production and marketing unless manures are an integral part of the research question. The corollary is to fund more research that both considers manure as an integral part of the production system and innovative ways of better managing this manure.”²³

Thus, integrating manure as a resource into whole-farm management plans will enable us to find cost-effective means of protecting waters from manure pollution.

Irrigation Pollution

Irrigation agriculture, which accounts for 90% of the water consumed in the West, results in poisoned return flows which cause serious damage to waters and wetlands, endangering aquatic wildlife with toxics including selenium, boron, molybdenum, and chromium. Selenium has been identified as the cause of an observed high (64%) rate of deformed and dead bird embryos at Kesterson National Wildlife Refuge in California.

Although they begin with the diffuse flow of irrigation water off of farm fields, irrigation flows end as point source discharges, conveyed through pipes or ditches. Irrigation return flows have been given an express exemption from NPDES permitting in the Clean Water Act, without any database showing that the flows are benign. In fact, the U.S. Fish and Wildlife Service's preliminary data indicate that almost half (48%) of the Service's refuges that have toxic contaminant problems receive agricultural drainage.²⁴

Grazing

Accurate national statistics on the total water quality damage wrought by grazing on both public and private rangelands are not currently available. However, the surveys that have been conducted on public rangelands do show massive damage to riparian areas from overgrazing. *Statewide surveys by the Bureau of Land Management (BLM) in Colorado and Idaho, and more limited BLM surveys in Nevada and Utah, showed that over 80 percent of assessed streams or riparian areas were in poor or fair condition.* Surveys by the U.S. Forest Service produced similarly troublesome results; in Arizona, 80 to 90 percent of the stream riparian areas in the Tonto National Forest were in unsatisfactory condition.²⁵

Rangeland expert Lynn Jacobs gives additional data on grazing damages to streams in the West, citing wildlife ecologist Charles Kay: “A recent study in Wyoming found that of 262 miles of streams, only 2% function now as they did in 1850. Eighty-three percent of the streams were lost or destroyed by overgrazing and accelerated erosion. The remaining 15% were in fair to good condition.”²⁶ According to another range technician, riparian damage from cattle is so widespread in the West that most people, including most range managers, have never seen a healthy stream channel.²⁷

And this riparian damage is done to vast areas of the west, for the sake of a tiny proportion of the nation's livestock: Although 90% of our western BLM lands are used for ranching, they produce only about 1.1% of U.S. cattle and sheep.²⁸ A GAO report on the health of riparian areas on U.S. public rangelands points out that the preferred management practice, cattle exclusion from streamside zones combined with revegetation, can reduce many of these impacts. Unfortunately, this practice is not required in many areas, and BLM staff are thwarted by their own top management in carrying out riparian restoration projects.²⁹

Livestock Confinement (Feedlots)

EPA's Office of Policy, Planning and Evaluation estimates that, based on the U.S. Census of Agriculture, at least 1.1 million farmers have livestock. Of those, only 5,000 to 10,000 operations nationwide may be above the current 1000-unit cutoff for NPDES permit issuance.³⁰ For the rest, no particular federal manure management requirements apply under the Clean Water Act. For an example of the severity of the manure pollution problem, a Chesapeake Executive Council (the governing body for the Chesapeake Bay cleanup) report that found that “Control of 85 percent of Pennsylvania's animal waste alone would accomplish a 40 percent nutrient reduction for the state.”³¹ The Chesapeake Bay Foundation concluded that Pennsylvania should toughen its manure management program, including the “targeting of enforcement efforts at those operations responsible for disproportionately high nutrient loads as well as committing more resources to the program in general.”³²

Mining/Resource Extraction

Of the 171,008 impaired river miles assessed by the States for the 1988-1990 305(b) reports, 14 percent, or almost 25,000 miles were polluted by mining runoff (designated "Resource Extraction" by EPA.)³³ As reported by GAO, a 1976 study by an EPA contractor found that "80 percent of the nonpoint source pollution from inactive and abandoned ore and mineral mining areas was occurring in five states—California, Colorado, Idaho, Missouri, and Montana. . . . The principal pollutants from these mines and mine waste piles were acid mine drainage, heavy metals, and sedimentation." As with all poison runoff sources, assessed sites are only a small portion of the total; in Colorado, for example, the state had studied the environmental impact from only about one-sixth (8,000 out of an estimated 50,000) of the State's noncoal abandoned or inactive mines.³⁴

Urban Development

Over 9800 impaired river miles, or 5.7% of total impaired miles, were polluted by construction runoff in the 1988-90 reporting cycle, and over 18,000 impaired river miles, or 10.6% of total impaired miles, were polluted by storm sewers from urban sites in the same cycle. (Urban watershed degradation and restoration are discussed at length below.)³⁵

Logging

A total of 9% of impaired river miles, or 15,459 miles, were reported by the States as polluted by silvicultural activities in the 1988-1990 reporting cycle. These figures are probably gross underestimates, however, since some key logging States such as Maine do not monitor for logging-related parameters such as siltation levels.³⁶ As EPA points out in its final 319 report, "The absence of information from 12 states significantly distorts the figures; Alaska and Oregon, in particular, have considerable forestry activity and their inclusion would have affected the total."³⁷

Fisheries biologists in the Northwest have discovered that logging tends to destroy fish habitat more profoundly than previously believed. Siltation from logging operations has long been known to clog the gravel beds that are the spawning grounds for threatened salmon species. Only since the early 1980s, however, have biologists discovered that salmon survival requires more than silt-free gravel beds for spawning. It also requires extensive drainage way protection, since the young-of-the-year are reared in the tiny, capillary-level first-order tributaries, abandoned meander ponds and seep-fed creeks. According to naturalist Robert Steelquist:

"There they grow rapidly on aquatic insects and other organisms. This burst of growth gives these cohos a distinct advantage for survival at sea when they eventually leave the freshwater system. . . . These pond and tributary habitats, however, had never been recognized for their contribution to coho productivity. Though measures were in place to protect main-stem habitats from destruction, the beaver ponds and small channels were particularly vulnerable to logging, road building, and culverts, often filling with slash and debris."³⁸

The road cuts, skid trails, and clear cuts that timber companies bring to forest lands do extensive damage to streams, rivers, and lakes around the country. In Maine, for example, a study done in the late 1970s by the Maine Forest Service found the following: 52% of harvesting sites had erosion or sedimentation problems; a substantial number of sites near State designated protection zones violated logging road runoff and stream crossing requirements; and siltation in waterbodies from logging operations located from 75 to 250 feet from the waterbody. (Despite this evidence of widespread harm to water quality, water-sensitive practices for logging sites are still voluntary for the vast majority of the Maine Woods.)

III. *What does the CWA say about these problems, and how good a job have EPA/States done in carrying out the will of Congress?*

A. *Runoff Mandates Dating Back to 1972 Were Abandoned or Implemented Poorly.*

The Clean Water Act has addressed runoff pollution explicitly since the Act's inception in 1972. As NRDC points out in the book *Poison Runoff*, runoff control mandates in the pre-1987 Act could have been used more effectively. In fact, since 1972 the CWA has required that EPA and the states devise comprehensive programs to control water pollution from both point and nonpoint sources. At least five pre-1987 sections of the Act—102(a); 201(c); 208; 303; and 305(b) relate to, or explicitly describe, poison runoff assessment, control and reduction.³⁹ Below we describe briefly these requirements of the *original* Clean Water Act, and the degree to which they were implemented around the country.

Sections 102(a), 201 and 208 provided broad authority to EPA to set up holistic pollution prevention programs to protect water quality (long before "pollution prevention" became a popular term). Section 201(c), addressing areawide waste treatment management, was designed to ensure that State and local managers of the construction grants program would not have "point source tunnel vision." Congress wanted comprehensive water pollution benefits, through the control or treatment of *all* pollution sources, not just point sources of raw sewage and industrial waste.

Section 208 can be seen as further explication of the "comprehensive program goal" set forth in section 201. Section 208 is perhaps the best-known of the pre-1987 poison runoff requirements of the Act, partly because so many citizens participated in the creation of 208 plans. Section 208(b)(2)(F) requires areawide waste treatment management plans to include:

"a process to (i) identify, if appropriate, agriculturally and silviculturally related nonpoint sources of pollution, including return flows from irrigated agriculture, and their cumulative effects, runoff from manure disposal areas, and from land used for livestock and crop production, and (ii) set forth procedures and methods (including land use requirements) to control to the extent feasible such sources."

A series of Congressional hearings in 1979 highlighted the following problems as having hindered the success of the 208 program:

- too little time in which to create the plans;
- discontinuity and lack of federal funding;
- inadequate water quality data; and
- poor management by EPA.⁴⁰

These same hearings emphasized several obstacles preventing managers from implementing practices to stem the flow of runoff:

- inadequate data on the effectiveness of control measures;
- institutional conflicts;
- need for public education on the benefits of nonpoint source control;
- [inadequate] funding, and
- debates over regulatory versus voluntary approaches to induce cooperation.⁴¹

A total of 176 Section 208 plans were created, plus another 49 State-level areawide plans. These 225 comprehensive water quality plans represented a definite step forward in the national knowledge base on diffuse, land-based pollution sources, and on watershed management in general. Another strength of the 208 process was that it had very high levels of public participation, particularly from citizen leaders from the League of Women Voters, and from local Resource Conservation Districts.⁴²

Sadly, during the 1980s, most 208 plans were shelved, and their excellent concepts have fallen by the wayside. Reasons for the failure of the 208 process, in addition to the overall lack of implementation mandates and other administrative problems listed above, include lack of funding; EPA timidity in issuing stringent guidelines, and in linking 208 implementation with mandates to achieve water quality standards;⁴³ and the turf battles that flare up when watershed boundaries cut across political boundaries.

Earlier, we described sluggish progress in employing a number of other tools, basic to the CWA, that have potential power to stem the flow of runoff. These include water quality standards, the 303(d) TMDL (Total Maximum Daily Loads and Wasteload Allocation) approach, 305(b) assessments, and other basic CWA tools. Water quality standards and their implementing mechanisms, including effective state anti degradation programs, are especially important to the success of runoff reduction programs, and are crucial to runoff programs for two basic reasons:

- All programs to control poison runoff must be designed to achieve compliance with water quality standards;⁴⁴
- At least before 1987, water quality standards formed the principal legal authority for controlling pollution generated by various land use activities.

Volunteers Needed to Help States Fill the Runoff Monitoring Gaps

Water quality standards must work hand-in-hand with well-targeted monitoring and assessment programs in order to be effective for any pollution control program, including runoff control. Section 305(b)(1)(E) of Clean Water Act requires that the biennial state water quality assessments include:

... a description of the nature and extent of nonpoint sources of pollutants, and recommendations as to the programs which must be undertaken to control

each category of such sources, including an estimate of the costs of implementing such programs.

Nonetheless, an EPA report on the main elements of State water pollution source monitoring programs suggests that, at least as of 1987, they were characterized by point-source "tunnel vision:" 1) self-monitoring of effluent by industrial and municipal dischargers; 2) compliance sampling inspections to cross-check discharger self-monitoring; and 3) effluent characterization studies for industrial dischargers. One of the five major "challenges" set forth for EPA in this study is to "Identify and Characterize Toxic, Conventional, and Anthropogenic Pollutants from *Nonpoint Sources*" (emphasis added). This report also recommended an in-depth study of the feasibility of initiating a "Citizen's Watch Program."

Both of these recommendations, if they were to be followed by EPA, would have major benefits for the ability of the States to characterize the threats and impairments due to land-based sources of pollution.⁴⁵ The good news is that apparently many States are now beginning to shift their monitoring efforts into land-based sources of water pollution, at least according to one 1992 report described in the next section.

The early 1980s represented perhaps one of the lowest periods in the history of poison runoff policy. Funding for the 208 program was gutted in 1981.⁴⁶ Then, in 1983, EPA contended that the Agency had no direct role in controlling poison runoff. In addition, the Reagan Administration actively opposed the establishment of a new, comprehensive runoff control policy.⁴⁷ Obviously dissatisfied with the lack of progress made by states in stemming the flow of runoff, Congress created new requirements in the 1987 Clean Water Act. For the first time, poison runoff was addressed head-on in a new section of the Act.

Section 319: Congress Put Increased Emphasis on Runoff Programs in 1987

In 1987, Congress created Section 319 of the Clean Water Act, designed to get States to identify waters damaged or threatened by runoff sources, and to develop comprehensive programs to heal those waters by reducing and eliminating pollution from those land-based sources. This program was not completely new; rather, it gathered up provisions for runoff controls dispersed throughout the Act and EPA guidance, and corral led them into one program.

This section of the Act strengthened the substantive standard for runoff control program effectiveness by requiring, in 319(a)(1)(C), nonpoint source reduction, "to the maximum extent practicable." By contrast, the earlier 208 programs were held to a much weaker standard of runoff reduction "to the extent feasible." As NRDC observed in *Poison Runoff*, the new standard of "maximum extent practicable" "will demand a higher level of control and a more stringent standard of proof before degradation or downgrading can be permitted."⁴⁸ Unfortunately, the promise of section 319 has not been fulfilled. True, there have been some notable success stories, described below. On a national basis, however, significant progress has not been shown under the new program.

B. *Watershed Restoration Success Stories*

Although Congress intended for the states to structure their poison runoff control programs as much as possible on a watershed basis (319(b)(4)), many states did not do so, choosing instead to write management plans based upon generic management practices intended to apply to all lands within each major land use category in the State. Some states, like Wisconsin, are exceptional in that runoff control is part of a comprehensive, watershed-based restoration and protection program that targets specific watersheds throughout the State. Other States are notable for individual watershed programs that stand as shining examples for others to follow. Three such programs are described briefly below.

Owl Run Watershed, in Fauquier County, Virginia, has a major nutrient and animal waste problem that contributes to dissolved oxygen and other water quality problems in the Chesapeake Bay. In response, the Virginia Division of Soil and Water Conservation, in cooperation with conservationists at the John Marshall Soil and Water Conservation District, are helping farmers to reduce manure pollution through a variety of techniques. Management practices in the 2800-acre watershed include soil testing and the creation of nutrient budgets, no-till cropping and filter strips, and the construction of manure storage tanks. Cost-sharing can cover up to 100 percent of the farmer's installation costs. The purpose of the project is to show that these kinds of practices are effective on a whole-watershed basis in reducing pollution. The water quality goals around which the project is designed include both in-stream, and downstream (Chesapeake Bay) restoration.⁴⁹

Big Darby Creek Watershed, Ohio. This multi-party project in central Ohio, coordinated by the Nature Conservancy, proves that farmers and environmentalists can be friends. A major goal of the project is to enroll 75% to 100% of the watershed's farmers in a conservation tillage program; roughly 15% of the watershed's farmers now use conservation tillage. Cooperation and rapport have been enhanced by the knowledge that Big Darby is a unique ecosystem with many endangered or threatened species of mussels and fish, and by the now-famous canoe trips in which each canoe holds a farmer and an environmentalist, who survey the riparian zones together as they glide down the river. Many farmers in the 370,000 acre watershed are also installing forested buffer strips with the help of state foresters. The project's 1992 budget totalled more than \$750,000, with monies obtained from the Soil Conservation Service, TNC, Environmental Protection Agency, and other agencies and groups. Big Darby is not a purely agricultural watershed. A remaining "wild card" for the fate of the headwaters is whether suburban developers, seeking to supply wealthy residents of Columbus with low-density "country" housing, will be convinced to adopt water-sensitive practices of their own.⁵⁰

Big Spring Basin, Iowa. The Iowa Department of Natural Resources, Geological Survey Bureau, has helped to make the Big Spring Basin famous for nitrogen input reductions that have saved farmers money while they reduce water pollution. Through a state cost-sharing program and extensive technical outreach to the roughly 200 Basin farmers, a reduction of over 1.2 million pounds of applied nitrogen was achieved between 1981 and 1989. This input reduction achieved a savings of about \$200,000 per year, or an average of \$1,000 per year per farm. With crop rotations that have farmers planting corn following alfalfa, maximum yields are often obtained with no addition of nitrogen to the soil.⁵¹

These "watershed success stories" are cause for hope that whole-watershed restoration works, that cooperation between different stakeholders can be gained, and that farmers are willing to adopt water-sensitive practices once they are convinced of three things: 1) that such changes are needed by an ailing or vulnerable ecosystem; 2) that such changes will not bankrupt their farm (and may even save them money); and 3) that the risk and burden of adopting new practices is shared equally among all other farmers and landowners in the watershed.

The three examples given—Owl Run, Darby Creek and Big Springs Basin—are voluntary programs. Their premise is that, given ample time, money, and technical outreach, all farmers will "volunteer" to "do the right thing." *Unfortunately, these programs may not be support in all impaired or threatened watersheds in each state, since ample grant monies to replicate their very favorable cost-share ratios statewide simply do not exist.* The need for urgent action in the case of impaired watersheds, and the need for accountability, demand more than voluntary programs.

C. *Recent Federal Oversight Shows EPA's Implementation of the 319 Program has Lacked Vision and Leadership*

The EPA's Office of Policy, Planning and Evaluation (OPPE) reviewed the 319 program in the summer of 1992 at the request of the Office of Water. The study looked at 10 sample state programs, as well as the management policies at the EPA headquarters and regions. The report reached 12 findings about what's right—and what's wrong—with the 319 program:

- 1) Because of the diverse nature of NPS [nonpoint source] pollution, there is no single definition of a NPS program.
- 2) Authority for Implementing State Management Programs is generally decentralized.
- 3) The extent to which States are institutionalizing their NPS programs varies widely.
- 4) The majority of the ten States do not have NPS programs oriented toward improving water quality on a watershed-specific basis. (Emphasis added.)
- 5) State Management Programs generally cannot be used to gauge the States' progress in implementing NPS controls.
- 6) Flexible guidance has enabled States to use 319 resources to address numerous NPS priorities.
- 7) States concentrate their use of 319 resources to focus on different priority activities.
- 8) The majority of States are making some effort to monitor the effectiveness of BMP implementation, though water quality impacts due to implementation of 319 are as yet unknown.

- 9) Section 319 has facilitated increased communication and coordination among agencies and organizations to develop and implement the State Management Programs.
- 10) Although most EPA Regional EPA Offices use several staff to address NPS pollution, few staff are dedicated specifically to assisting States to implement management programs or 319 grants.
- 11) EPA Regional office implementation of the 319 grant program varies considerably across EPA regions.
- 12) EPA provided States the opportunity to develop diverse NPS programs, but has not yet defined a vision or role for a national NPS program.⁵² (Emphasis added.)

OPPE then made the following two recommendations: a) the Office of Water should emphasize more clearly that a watershed protection approach should be the basis of State NPS programs; and b) Office of Water and Regional Offices should clearly define EPA's goals, strategy and role for the national NPS program.⁵³

One of OPPE's most important findings was that "The majority of the ten States do not have NPS programs oriented toward improving water quality on a watershed-specific basis." Furthermore, "the majority of [State Management Programs] do not identify strategic plans or milestones for achieving water quality goals for specific waters identified in their Assessment Reports."⁵⁴ Thus, the requirement of section 319(b)(4), that States shall, to the maximum extent practicable, develop and implement management programs on a watershed-by-watershed basis simply has not been enforced by EPA. Although of course some state-to-state variation is expected and even desirable in the 319 programs, the report clearly suggests the need for more program focus at both the federal and the State levels.

Lack of Adequate Funding

The General Accounting Office (GAO) also reviewed section 319 program implementation in 1990. GAO found that:

"officials in five of the states we visited identified the lack of resources as a key barrier to controlling nonpoint source pollution. Although some states have or will allocate million of dollars to deal with the problem they maintain that it would require billions to correct."⁵⁵

The total 319 appropriation for the past four fiscal years—roughly \$200 million—represents a drop in the bucket, compared both to present program needs, and to the total \$50 billion investment the nation made in sewage treatment, (significant given that poison runoff pollution dwarfs the sewage treatment challenge of the early 1970s).

D. *Summary of Findings on Existing Runoff Control Programs, and Prescriptions for Changes Needed*

As is true for many outstanding water quality problems, there are major gaps in the development and use of the Clean Water Act's basic tools for reducing poison runoff. Their absence is perhaps most acute within the context of fledgling state poison runoff control programs, partly because the tool of NPDES discharge permits is usually not available to give these programs the "backbone and bite" of an automatic enforceable mechanism. Thus, the relative weakness and under development of the tools that are available to runoff managers—water quality standards, water quality assessments targeted to land-based sources, TMDLs, and whole-watershed plans—has hindered progress in stemming the flow of poison runoff.

E. *On the Need for New Water Quality Criteria Relevant to Runoff Impacts*

Although EPA took a quantum leap forward with the publication of its document "Biological Criteria: National Program Guidance for Surface Waters" (April 1990), few states have acted to use biocriteria in important ways in assessment and/or permitting. No water quality standards at the State or federal level have been established to protect physical or hydrological features of aquatic habitat, such as the destruction of first-order streams noted above in the logging discussion. To protect whole aquatic ecosystems from the abuses of shopping mall and subdivision development, logging, mining, and other land operations, EPA needs to publish, and the States need to implement, water quality criteria for the following factors:⁵⁶

- biocriteria, such as EPA's recommended use of the Index of Biotic Integrity, first developed by Dr. James Karr and colleagues;
- habitat protection criteria for example, for pool-and-riffle complexes;
- drainage density metrics including minimal preservation and restoration of first-order streams;

- complete hydrologic specifications including year-round flow minima and minimum streamflow percentages of groundwater;
- seasonal and annual sediment loadings;
- nutrients (for eutrophication, not acute toxicity); and
- current-use pesticides.

In its review of EPA's management of the overall poison runoff program, the GAO listed the lack of appropriate standards as a key barrier to progress:

"Criteria documents" and other technical information are not available to states to enable them to set water quality standards for nonpoint source pollution. . . . State and federal officials told us that existing state water quality standards need to be supplemented because they were developed primarily to address point source problems and consequently have limited applicability in controlling nonpoint source pollution.⁵⁷

Summary and Conclusions on the States' Poison Runoff Management Programs under the 1987 Clean Water Act

In summary, there are many reasons why the 319 program, as implemented over the past five years, has failed to heal waters and watersheds damaged by land uses and abuses:

- 1) lack of watershed basis for the programs;
- 2) lack of adequate funding, especially for program staff at all levels;
- 3) inadequate enforcement of the mandate for States to require water-sensitive practices to be adopted wherever monitoring indicates a problem, or where pristine conditions indicate the need for protection;
- 4) major monitoring gaps;
- 5) inconsistent goals of other powerful federal programs, which thwart poison runoff control efforts;
- 6) continued reliance by the States on ineffective voluntary compliance for the adoption by landowners of water-sensitive practices;
- 7) reluctance to create relevant water quality standards to make the program meaningful; and
- 8) diffuse responsibility for the program; often administered and overseen by agencies that lack a primary water quality focus.

As a result of these major obstacles, our national poison runoff policy is based upon a voluntary, piecemeal approach riddled with inconsistencies, ineffectiveness, and massive gaps in funding, monitoring and staffing. As a result, we now have 50 individual runoff assessment and management programs that are all over the map in terms of comprehensiveness, stringency, degree of public participation, accountability, funding commitments, and in-stream effectiveness. And most programs fall on the voluntary, all-carrots-and-no-sticks side of the spectrum. Major strengthening changes are required in order to transform 319 into a publicly accountable and ecologically and economically effective program; unless these changes are made, it is likely to continue to be ineffective.

F. *The New Coastal Runoff Program Bears Promise, But Its Geographical Scope is Limited*

As part of the 1990 Coastal Zone Act Reauthorization Amendments ("CZARA"), Congress welded two existing programs—the States' Coastal Zone and Clean Water Act Section 319 programs—into a single, powerful approach to preventing and reducing runoff pollution in coastal—watersheds (including the Great Lakes). The centerpiece of CZARA is the implementation of enforceable management measures to reduce polluted runoff by specific land uses. Management measures are defined in Section 6217(g)(5) of CZARA as:

"economically achievable measures for the control of the addition of pollutants from existing and new categories and classes of nonpoint sources of pollution, which reflect the greatest degree of pollutant reduction achievable through the application of the best available nonpoint pollution control practices, technologies, processes, citing criteria, operating methods, or other alternatives."

The phrase "greatest degree of pollutant reduction achievable" is more stringent than the "maximum extent practicable" standard for BMPs under Section 319. Other important provisions of CZARA include:

- the extension of coastal zone boundaries farther inland, to control the land and water uses that have a significant impact on coastal waters;

- implementation of additional management measures, where necessary to meet or protect water quality standards and to protect the waters of critical coastal areas;
- use of enforceable policies and mechanisms to implement the management measures; and
- program coordination to ensure consistency of this new coastal zone program with Clean Water Act programs under Sections 208, 303, 319, and 320.

For those who had grown weary of the haphazard nature of the BMP lists in the State runoff control programs under Section 319, the CZARA program looked like it might provide fairly seamless coverage of water-sensitive practices across wide swaths of coastal zones. The second major advantage of CZARA over the 319 program is that it requires EPA to provide the States with definite guidelines for those water-sensitive practices. Under CZARA, States will have to implement management measures in their coastal zones that are consistent with EPA's minimum management measures, thus removing some of the randomness (and weakness) that characterizes many 319 programs. EPA's final CZARA management guidance was issued in January, 1993.⁵⁸

Environmentalists and some progressive State administrators urged EPA and NOAA (who jointly administer the program) to base the management measures on objective, measurable criteria to ensure their effectiveness and accountability from state to state. Unfortunately, EPA and NOAA did not always heed this advice. For example, the draft guidance for controlling sediment pollution from farms originally would have required farmers to reduce erosion to the specified levels (the "T" soil loss tolerance standard). NRDC and several other organizations supported this standard. Although less than perfect, it would afford an objective performance standard around which each coastal zone farmer could structure site-tailored erosion controls. In the final guidance, however, EPA caved to pressure from commodities groups and other agricultural special interests, and recast the agricultural erosion control measure as the "Alternative Conservation Systems" described in the Field Office Technical Guides of the SCS. ACSs are generally sound practices, but provide little objective guidance to judge whether a farm has adopted sufficient erosion control practices.

Despite this weakening of the performance requirements for some of the management measures, however, the CZARA program remains a model for strong State runoff reduction programs. State implementation of required management measures for each land use category would improve 319 programs greatly if it were adopted for all watersheds, not just those in the coastal zone.

The coastal zone runoff program also contains some management measures, like vegetated riparian buffers, designed to protect and restore urban waters. Urban watersheds are severely degraded by a multitude of runoff sources. Federal and State money and leadership are needed to create community programs that restore urban streams to full vitality; we describe these problems and solutions in part V below.

IV. *Brief Analysis of Title III of The Water Pollution Prevention and Control Act of 1993: "Watershed Planning and Nonpoint Pollution Control."*

Major Points Concerning Title 3 of S. 1114

Title III of S. 1114 has several important elements that we support in concept. These include: 1) whole-watershed planning as the preferred approach for restoring water quality, particularly for those waters impaired wholly or substantially by land-based sources; 2) required management measures for new sources; 3) further coordination between water-quality-related Farm Bill programs, and Clean Water Act programs; 4) encouragement of volunteer citizen water quality monitoring; 5) significantly increased funding levels for nonpoint source programs, and 6) provisions for runoff controls for activities on federal lands.

There are other, smaller elements that we also support, as well as aspects of Title III that we cannot support because we believe they unnecessarily weaken watershed restoration and runoff prevention and reduction programs. We will provide to the Committee more detailed comments on Title III in the next few weeks.

Below we discuss each major section of Title III, with the bulk of our comments aimed at Section 304, Nonpoint Pollution Control.

Section 301. Water Quality Monitoring

This section replaces the existing section 305(b), which currently requires reporting every 2 years, with a new requirement for reporting every 5 years. We oppose this change, unless it is accompanied by tougher requirements for more comprehen-

sive, accurate, and consistent reports than are now required of the States. In particular, we suggest the following changes to the bill:

(a) States should be required to assess all watersheds in the state every 5 years. The bill says "all"—p. 78, line 7—but so does existing law. This should be clarified to include actual monitoring and assessment of every watershed.

(b) For each watershed, States should be required to monitor for all known or suspected pollutants, in the water, sediment and biota, and to assess physical, biological and other sources of impairment.

(c) In determining use attainment, States should be required to use uniform criteria established by EPA, so that States can be compared fairly. These criteria should prohibit identification of waters as "fully supporting" uses when water quality criteria are violated, or other evidence of impairment exists.

(d) State review and use of volunteer water quality monitoring data should be required as it is in Title IV of H.R. 2543 (the "Oberstar Bill"), not merely encouraged as it is in subsection (a) of Section 301 of S. 1114.

Further comments regarding citizen volunteer water quality monitors: although we support the inclusion of representatives of volunteer monitoring groups in the Water Quality Monitoring Council, the prohibition on travel expense reimbursement will severely curtail the ability of such representatives to participate in the work of the Council. Most volunteer groups, and the citizens who participate in them, have little or no travel funds to support long-distance travel for the work of official advisory councils and committees. We suggest that this stricture be removed altogether, or at least changed to allow for some reimbursement to be provided to those who can demonstrate economic need.

Section 302. Comprehensive Watershed Management

We support the idea of whole-watershed planning in concept, but we see it as a way to identify and address sources of impairment. Whole-watershed planning mechanisms must not be allowed to become an opportunity for nonproductive "griping," "finger-pointing," or "buck-passing" between point and land-based sources, or among members of the same polluter category. Neither must we allow watershed planning to degenerate into a forum for downgrading water quality standards and broader restoration and protection goals.

To avoid these problems, amendments to the Clean Water Act for whole-watershed planning need to include the following five explicit requirements: 1) retention of basic water quality standards-setting authority solely in the hands of the State water quality agency; 2) adoption and inclusion of all applicable water quality standards and criteria for all waters in the watershed within the restoration and protection plan; 3) establishment of habitat restoration and protection, biodiversity, wetlands, floodplains, and other broader aquatic ecosystem goals and objectives as part of the watershed plan; 4) adoption of antidegradation goals, objectives, and standards including Tier II and Tier III antidegradation provisions (the current S. 1114 only requires Tier I antidegradation provisions); 5) establishment of enforceable, minimum water quality protection and restoration requirements for all sources (esp. including land-based sources) prior to the establishment of "trading" schemes.

Regarding the States' designation of watersheds: the voluntary nature of this program could result in either "triage," where only a few of the most degraded watersheds are addressed, or "showcasing," where the pristine gems are protected to the neglect of virtually every other watershed. We have seen examples of both of these cramped State approaches to watershed designation. The bill's several financial and "point-source-based" incentives, aimed at encouraging the whole-watershed approach, will probably spur more states to designate more watersheds, but are not a substitute for a required protocol that will ensure objectivity and truly comprehensive watershed targeting on the part of the States.

We believe that the best approach to watershed targeting and State designation is to require States to follow an objective protocol for designation that reflects the truly comprehensive restoration and protection goals of the original Clean Water Act. For example, we support the approach of H.R. 2543, the Nonpoint Source Water Pollution Prevention Act of 1993, introduced this month by Congressman Oberstar. H.R. 2543 requires each State to list as a Target Watershed each and every watershed of a water already on a State 305(b), 319(a), or 304(l) list.

We suggest that S. 1114 be amended to reflect the same or similar, comprehensive targeting requirement, or at least a targeting protocol that will capture all (or most) of the watersheds that deserve such attention.

Regarding subsection (3) of this section: we oppose delegation to the States of any aspect of watershed planning for which EPA currently has review/oversight/approval responsibilities. This includes water quality standards (use designation; crite-

ria; and antidegradation programs), wasteload allocations, NPDES program elements (including 402(c) permit veto authority, etc.

Traditionally NRDC has opposed the use of ten-year permits. Section 302, subsection (4) calls for their use. At a minimum, permits must be allowed to be reopened for changes in effluent guidelines, and any other new requirements that pertain to the point sources in question.

Section 303. Impaired Waters Identification

In general, we believe this provision creates an open-ended process that will lead to a repeat of the mistakes made in other open-ended listing mechanisms, notably section 304(l). As noted above, the Clean Water Act needs a mechanism that will accomplish the restoration and protection, over time, of *all* watersheds. This provision, in contrast, leaves the listing completely in State hands. Based on our experience with 304(l), EPA and citizen petition authority is a poor substitute for comprehensive State identification. Since the success of the runoff program in S. 1114 turns on how many waters/watersheds get identified, this historical inability of the States to be objective and comprehensive in their identifications is of critical importance.

Section 304. Nonpoint Pollution Control

In general, for those waters covered by the program, this section would move us in the right direction; it does contain some key flaws that need to be fixed.

We address below the following key elements of Section 304; more-detailed comments on this section will be provided to the Committee in the near future:

- (a) Whole-watershed planning and flexible site-level plans;
- (b) required management measures;
- (c) new source requirements;
- (d) credit to farmers enrolled in Conservation Compliance.

We briefly address each of these main elements in turn below.

Whole-watershed planning: As we discussed above in our comments in section 302, the open-ended watershed designation process for the States is flawed because the history of section 304(l) and other similar voluntary listing exercises is that the States do not tend to follow objective, comprehensive protocols, and thus the lists are often absurdly small and inadequate. This flaw in section 302 casts serious doubt on the success of the watershed planning component of section 304, since many States could well opt to designate a handful of showcase watersheds to satisfy this provision, giving a false sense of security that the watersheds that need protection and restoration on a whole-watershed basis, will get such plans and protections.

Subsection (a) of Section 304 contains an enforcement provision for the required management measures and, by reference, the "optional" site-level plans. This provision does not "kick-in" until seven years have transpired. This is far too long for the States to wait before implementing the necessary legal authority to ensure that on-the-ground actions are taken. Such authority should begin as soon as *any* required management measure, or site-level plan, is first implemented.

Site-level plans: We support the inclusion in S. 1114 of the site-level planning option, although we prefer the approach taken in H.R. 2543, where flexible site-level plans within whole watershed programs are not optional but required. Nonetheless, the site-level planning option in S. 1114, if strengthened, could be workable and effective. In particular, we want to see requirements for the time-frame of the site-level plans changed so that the plans must be maintained into perpetuity; with provisions for plan revisions at certain reasonable intervals. In addition, the requirements for the site-level plans must specify that they are to be designed to reflect, and collectively to enable, the attainment and maintenance of the watershed plan's goals and objectives.

Required management measures: Since the "specter" of imposition of management measures is the "stick" that is intended to drive effective site-level water quality plans and state participation in voluntary watershed planning, the management measures must be strong, and include performance standards. Therefore, we are concerned that the management measures will not be a cursory revision of the so-called "Coastal Zone" (Coastal Zone Act Reauthorization Amendments of 1990—CZARA) management measures. Since the CZARA guidance is the current EPA compendium of runoff control measures, and the bill gives EPA only 90 days to issue its guidance, this prospect may be spurred on by S. 1114. Our single greatest problem with the CZARA measures is that they tend to lack performance standards, such as "T" (the soil loss tolerance factor) as the performance standard for farm erosion control.

With sound, objective performance standards, the choice and application of particular on-the-ground practices remains flexible and optional for the land operator. Without such performance standards, the management measure is either extremely open-ended and vague, as is the case for most measures in the EPA CZARA guidance, or results in the specification of actual practices that leave farmers and other land operators with little flexibility. Either outcome is undesirable, and S. 1114 needs to be amended to specify that the required management measures shall contain objective performance standards along with optional, flexible practices that directly conform to the water quality problems identified in the watershed.

New-source requirements: The definition of "New Source" in Section 304 should be based on the timing of the activity, not on a limited list of types of activities, as is now the case. On page 111, the "program implementation criteria" that pertains to new sources is unacceptably weak. The provision allows for "financial incentives" to serve as "enforceable mechanisms." This could be interpreted to mean, for instance, that developers don't have to use runoff-prevention-based site design, unless the State gives them cost-share money to do so. This would be an unacceptable outcome of this provision.

New Source Controls

Pollution Prevention in New Urban Developments

The concept of "pollution prevention," a congressional mandate under the Pollution Prevention Act of 1990, ideally would work hand-in-hand with the Clean Water Act programs relating to new urban developments. Preventing stormwater runoff from new urban developments is addressed implicitly or explicitly in both the "New Sources" provision of Title III of S. 1114, as well as the stormwater provision of Title IV. We propose that the following runoff prevention and reduction hierarchy be applied to requirements for new developments (as well as existing developments where appropriate):

- 1) for new development: runoff prevention through mapping and preservation of natural drainage ways, preservation of mature forest zones along waterways, and caps on the amount impervious surface;⁵⁹
- 2) for redevelopment and retrofitting of existing developed areas: runoff reduction through revegetation, impervious surface reclamation (e.g. retrofitting parking lots with grass swales designed to capture and filter the lot's runoff, thus preventing or severely reducing the need to discharge to a nearby stream);
- 3) chemical source controls and toxics use reduction (e.g. policies that require lawn service companies to test lawns for nutrient content and pest problems before applying chemicals, in order to reduce lawn chemical use); and
- 4) conventional "end-of-pipe" stormwater treatment devices, such as extended detention ponds, infiltration trenches, and catch basins.

Prevention-based stormwater controls are known to be more cost-effective than the usual dominant reliance on end-of-pipe retention ponds that has—characterized stormwater programs in such regions as suburban Maryland. The new town development project called Woodlands, Texas, pioneered "Design With Nature" as a stormwater management concept in the early 1970s and showed that the natural drainage/vegetative retention option saved over \$14 million for the development, a four-fold savings over the estimated costs of conventional stormwater management.⁶⁰ The lesson here is that cost-saving and water-protective measures have been known to the development community for at least two decades; the problem is that lax and fragmented local government planning and Zoning procedures have thwarted the widespread use of these design principles. The new coastal nonpoint pollution control program contains a site design management measure that is a step in the right direction towards "prevention design" for stormwater management. Without the addition of a requirement that verifiable performance standards be attached to this measure, even if accomplished at the county or other local level, this measure may remain little more than a well-intentioned, but toothless, concept.

For both new urban development, and existing development, prevention-based stormwater practices for Clean Water Act "402(p)" programs, as well as for urban components of revised section 319 and whole-watershed programs, are available that are cost-effective, affordable, and amenable to financing through use of a variety of funding sources including stormwater utilities. The challenge to Congress, EPA, and the States is to articulate a stormwater permitting policy that contains cost-effective minimum mandatory practices known to protect urban waters, and to provide funding for sufficient technical and programmatic support to municipal managers.

Giving exemption to farmers doing Conservation Compliance plans: This provision is acceptable only to the extent that the problem in the watershed is sediment pollu-

tion, since these plans only address soil erosion (and are triggered only by the presence of highly erodible land on farms enrolled in the Farm Bill Commodities program, not by the location of farms within water quality-limited watersheds). A particular problem with this exemption is that one of the most common practices used by farmers enrolled in Conservation Compliance, "no-till" cropping, is known to involve increased use of herbicides which particularly threaten groundwater supplies. Indeed, the Wall Street Journal has referred to this phenomenon as "Spare the Plow. . . Spread the Chemicals."⁶¹

In summary, we believe that the provisions of Title III, and of section 304 in particular, are workable and potentially effective if the strengthening changes outlined above are made. Below we have summarized our own overall watershed restoration and runoff control policy.

Summary of Our Whole-Watershed Restoration and Runoff Control Policy

Comprehensive requirements are critical to the effectiveness of both watershed targeting and landowner responsibility in the target watersheds. All watersheds of waters on the "sick lists"—305(b); 319(a); and 304(l)—need to receive some kind of "care" to restore them to full health. And, in order to accomplish the restoration goals in each target watershed, all landowners and operators must be required to tailor water-sensitive practices to their particular site. This latter policy is consistent with the recommendation for farm-level planning in Water Quality 2000, which states

*"Farm-level resource management plans should be mandatory for all farms in watersheds where surface waterbodies or around water systems are impaired or where there is a probability that these waterbodies or systems will become impaired. Further, in watersheds that are not determined to be threatened or impaired, if individual owner/operators are causing significant pollution or are clearly violating water quality standards and the situation cannot be resolved expeditiously by voluntary programs, these individuals should also be required to develop and implement farm-level resource management plans."*⁶² (Emphasis added.)

There were sixty organizations that ratified the overall Water Quality 2000 policy document that included this consensus statement on agriculture. Working through the Clean Water Network, we seek to apply this same watershed-wide, mandatory water quality planning policy to all land use categories in the target watersheds—logging, mining, subdivision development, as well as farming. Far from singling farmers out for special regulation, we seek to include farmers as full partners, alongside all other land users, in multi-lateral watershed restoration programs.

The heart of our polluted runoff prevention policy is whole watershed restoration coupled with required site-level water quality planning in the target watersheds, backed up by citizen water quality monitoring efforts. Without each of the three parts of this policy, the success of future watershed restoration efforts will be in jeopardy.

V. *Blighted Urban Waters Mirror Urban Decay—The Failure of Stormwater Programs and Need for Urban Watershed Restoration.*

Title III of S. 1114 is the bill's "whole-watershed" restoration and protection provision. Since we believe that urban watersheds deserve special attention within the Clean Water Act, we have included the following written testimony in anticipation and support of the upcoming hearing on watersheds.

Urban waters are among the most degraded in the country. Urban streams are concertized and channelized, used as conduits for stormwater runoff, industrial and municipal effluents, and raw sewage from leaking sewer pipes (often laid lengthwise in streambeds) or from combined sewer overflows. And as if all of this abuse were not enough, many urban streams are obliterated altogether, "enclosed," (a euphemism for transforming a stream into an underground sewer), or (as in the case of many groundwater springs and first-order and ephemeral streams) simply destroyed beneath the treads of earth-moving vehicles preparing the ground for new development.

A. *The Degradation of Urban Waters and Watersheds.*

According to a 1992 EPA study of the environmental impacts of stormwater discharges, urbanization degrades a disproportionate share of our nation's waters:

While urban population areas take up only about 2.5% of the total land surface of the country, stormwater pollution from these urban areas and associated urban activities (i.e., storm sewers/urban runoff, combined sewers, hydromodifi-

cation, land disposal, construction, urban growth, etc.) accounts for a proportionately high degree of water quality impairment (i.e., 18% of impaired river miles, 34% of impaired lake acres, and 62% of impaired estuary square miles reported under 319) when compared to that from rural activities (i.e., agriculture, silviculture and mining) which take up approximately 53% of the total land surface.⁶³

Urban stormwater pollution thus deserves high-priority attention by citizen activists, water quality officials and other watershed stewards.

The most comprehensive study of urban runoff quality to date is NURP, the Nationwide Urban Runoff Program. NURP was a joint project between USGS and EPA between 1979 and 1983, and it looked at stormwater quality in 28 cities across the country. NURP found certain pollutants to be virtually ubiquitous in urban runoff, in average concentrations high enough to warrant concern over loadings in downstream sinks—estuaries like Chesapeake Bay, and lakes like Lake Quinsigamond in Worcester, Massachusetts. Among NURP's key findings:

- copper, lead and zinc were each found in at least 91 percent of the samples;
- other frequently detected contaminants included arsenic, chromium, cadmium, nickel, and cyanide;
- significant average concentrations of total suspended solids, phosphorus, nitrogen compounds, oxygen-robbing organic matter (BOD), and fecal coliform were found.⁶⁴

Using national average runoff pollutant concentration data derived from the NURP study, NRDC made coarse estimates of runoff pollutant loadings for heavy metals, oil and grease, BOD, nitrogen, and phosphorus for seven urban areas around the country: Baltimore, MD; Washington, D.C.; Harrisburg, PA; Tidewater, VA; Los Angeles, CA; Atlanta, GA; and Cleveland, OH. Although the results varied from city to city, these "Poison Runoff Indexes" showed that runoff rivals, and in some cases surpasses, factories and sewage plants as a source of these pollutants. For instance, in most of the urban areas modeled by NRDC, zinc loadings from runoff exceeded the loadings from factories in the State or region.⁶⁵

The NURP authors described the water quality impacts of urban runoff as falling into three categories:

- short-term receiving water impacts during or following storm events (where pollutant *concentration* is important);
- longer-term downstream receiving water effects—the buildup of contaminants in the sediments of "sinks" like river mouths, lakes, and bays (where seasonal or annual pollutant *mass loads* are important). (Although NURP did not examine in detail this phenomenon, NURP data enable coarse estimates to be made of runoff annual mass loadings from large urban areas.)
- physical effects of stormflows on the hydrology and geomorphology of urbanized watersheds—including stream channel scouring (NURP did not examine this third type of effect, but acknowledged its existence.)⁶⁶

One logical outcome of NURP's acknowledgement of this wide range in receiving water effects from urban runoff is the creation of comprehensive watershed restoration programs. An example is the program developed for the Anacostia River, which flows through Washington, D.C. and into the Potomac River after collecting urban stormwater from dozens of tributaries in suburban Maryland. The Anacostia is well-known both for its severe degradation, and for the extraordinary vision and commitment of the local governments now working for its restoration. The Six-Point Action Plan for the Anacostia's restoration is keyed to a list of six problems that could apply to dozens of urban watersheds nationwide:

- 1) *Poor water quality*: The tidal Anacostia estuary has some of the poorest water quality recorded in the Chesapeake Bay system . . . rapidly filling with sediment and debris . . . low dissolved oxygen levels . . . sediments contaminated with toxics . . .
- 2) *Ecological degradation*: Dozens of miles of stream habitat have been severely degraded by uncontrolled runoff, and in some cases by engineering "improvements." Urbanization has profoundly altered the flow, shape, water quality, and ecology of these streams, many of which possess only a fraction of their original biodiversity.
- 3) *Loss of anadromous fish habitat*: As many as 25 man-made barriers prevent the upstream spawning migrations formerly made by menhagens, yellow perch, herring, and striped bass.
- 4) *Loss of wetlands*: Over 98 percent of the once-extensive tidal wetlands and nearly 75 percent of the watershed's freshwater wetlands have been destroyed.

5) *Deforestation*: Nearly 50 percent of the forest cover in the basin has been lost due to urbanization. The most severe losses have occurred in the riparian zones, where trees play a critical role in maintaining stream water quality, preventing streambank erosion, and providing both aquatic and terrestrial habitat.

6) *Lack of public awareness*: The 600,000 residents of the basin are generally unaware that they live in the Anacostia watershed. They do not perceive their connection to the river and its unique natural features, the desire to take part in their watershed's restoration and to become stewards is largely unfulfilled.⁶⁷

Despite all of this degradation, urban streams, lakes and bays are still oases of life for millions of urbanites. Jamaica Bay is one 'example. 'Like many-city waterbodies, Jamaica Bay is oddly wild, given that it lies within the boundaries of New York City, is bordered by Brooklyn and JFK Airport, and its waters are affected heavily by a mixture of urban runoff and sewage effluent. According to some of Jamaica Bay's stewards,

" . . . fishing for sport and food has long been a favorite recreational activity in the park. Weekend fishermen line the railings of bridges and piers while others venture out in personal boats or charter fishing boats in hopes of a good catch."⁶⁸

The City of New York Department of Parks and Recreation, and the managers of the Gateway National Recreation Area, recently surveyed 450 fishermen who fish from the shores and bridges of Jamaica Bay. The survey revealed that 304 of the fishermen, or two-thirds, eat the fish they catch, despite the fact that it is contaminated with low levels of PCBs.⁶⁹ And Jamaica Bay is not unique. People of all ages can be seen fishing for crayfish in Sligo Creek, an Anacostia tributary, in Takoma Park, Maryland; and for catfish off of bridges over the Charles outside of Boston. People fish regularly in Lake Erie off of the 55th Street pier in Cleveland, and off of wharves in South San Francisco Bay. The fact that at least some of these people eat what they catch, even if it may be contaminated, is not a reason to shut these active fisheries down. It is a reason to work with a sense of urgency to reduce and eliminate the toxics now flowing into them.

B. *On the Need for An Urban Watershed Restoration Program in the Clean Water Act.*

Comprehensive watershed restoration programs are needed for our city waters—that highlight the importance of urban waters to inner-city dwellers, rely on local citizen groups and municipalities to initiate and structure long-term restoration strategies (that may include community-based studies like surveys of urban fishing patterns, and locally-based skilled jobs like urban forestry), and channel federal dollars to selected urban watershed projects to help fund the restoration work.⁷⁰ Such programs would help to focus the energies of urban activists into the work of "re-greening the urban landscape," enshrining this ecology goal as a critical part of the Clean Water Act's goal of "fishable, swimmable", waters for all Americans.

C. *On the Need for Jobs Within Urban Watershed Restoration Projects*

In restoring our degraded urban watersheds, we will help to build the skill level and the economic self-reliance of the inner city work force. New generations of skilled and semi-skilled workers are needed to restore damaged wetlands and floodplains and to design and build riparian buffer strips, runoff detention ponds, and combined sewer overflow storage tanks, all of which can be part of new urban watershed restoration programs.

It is critical that all urban watershed restoration programs, targeted to waters as diverse as the Anacostia in Washington, D.C.; the Los Angeles River, or Cleveland's Lake Erie tributaries, have three essential elements: a) primacy of local citizen group and local government leaders (with federal and State government in supportive roles); b) provision of jobs and career paths for inner city youths and skilled/semi-skilled workers seeking employment; and c) emphasis on "bioengineering" restoration, such as constructed wetlands and tree plantings on stream banks. Without these three essential elements, there is little guarantee that our investment in urban watershed revitalization will yield long-term returns in the form of "self reliant, green communities."

VI. Conclusion

Federal and State water quality managers have historically missed out on opportunities to stem the flow of poison runoff via implementation of several key provisions of the Clean-Water Act, most of which were available prior to the 1987 amendments. These key provisions include: development and application of relevant water

quality standards; whole-watershed planning and management; and creating focused, effective State runoff management programs. As a result of the failure to evolve these and other tools into effective runoff reduction and prevention programs on a watershed basis, the waters of the United States continue to be degraded by poison runoff from virtually every category of land use.

New federal and State programs, including the Coastal Zone Nonpoint Pollution Control Program, and municipal and industrial stormwater permits, provide new opportunities for States and EPA to eliminate the foot-dragging and unfocused, piecemeal approach to runoff control that occurred in the past. Whole-watershed management approaches are needed to tie together urban and rural dwellers in the goal of restoring their common waterways to full health. Such programs offer the promise that we can correct the mistakes of the past and actually stem the flow of poison runoff. Crucial to the success of these programs is the formidable political challenge of establishing enforceable requirements for water-sensitive land use practices and site designs that accrue to all of a watershed's landowners in a fair and equitable manner. If these elements are incorporated into a strengthened S. 1114, the bill has a strong chance of encouraging and creating the kind of watershed restoration and protection that all 50 States now sorely require.

 44. To quote from *Poison Runoff*,
 ". . . the degree to which poison runoff can be controlled dictates whether or not designated uses of individual waters are considered attainable:
 'At a minimum, uses are deemed attainable if they can be achieved by the imposition of effluent limits . . . and cost effective and reasonable best management practices for nonpoint source control. 40 CFR 131.10(d), 131.10(h)(2); 33 U.S.C.1315(b)(1).'
- In effect, a state cannot legally decide that the minimum fishable/swimmable goal of the Clean Water Act is not attainable in a particular surface water unless the state has developed a poison runoff control program that controls nonpoint sources to the maximum extent practicable, and still is unable to achieve fishable/swimmable water quality. Similarly, under EPA's antidegradation regulation, even where water quality is better than necessary to protect designated instream uses, allowing further degradation is prohibited unless, among other requirements, the state assures the achievement of "all cost effective and reasonable best management practices for nonpoint source control." 40 CFR 131.12(a)(2); 33 U.S.C. 1313(e).

TESTIMONY OF GERALD VAP, VICE PRESIDENT, NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS

Mr. Chairman and members of the subcommittee, my name is Gerald Vap and I am Vice President of the National Association of Conservation Districts (NACD). I also operate a farm supply outlet that sells hardware, nursery and garden supplies, native grass, alfalfa and sorghum seed. I appreciate the opportunity to present our concerns and recommendations on nonpoint source pollution and the Clean Water Act.

The National Association of Conservation Districts (NACD) represents nearly 3,000 local conservation districts across the United States, more than 15,000 men and women who serve without pay on their governing boards. Conservation districts are independent, special purpose districts that coordinate and carry out comprehensive, natural resource management programs that address forest and rangeland management, wetland protection and enhancement, agricultural and urban erosion and sediment control, wildlife and fish habitat management, and nonpoint source pollution prevention and abatement for the protection of ground and surface water quality.

CONSERVATION DISTRICTS

Conservation districts are special purpose units of government comprised of, and governed by, local citizens who know their own needs and work to develop the most

practical and effective solutions to natural resource management problems locally. Conservation districts have long been involved in developing and carrying out a variety of local conservation programs emphasizing the wise use, management, and development of our natural resources. Through their nationwide, grass-roots delivery system, districts coordinate and carry out innovative programs to address many natural resource management concerns, including nonpoint source water pollution prevention and abatement. Conservation districts provide a unique, local delivery system, the strength of which lies in local ownership of the programs.

Conservation districts and their cooperating state partners have been addressing nonpoint source pollution problems for a number of years. As early as 1977, when the Clean Water Act Amendments established Section 208 and recognized nonpoint source pollution as a major impediment to our Nation's clean water goals, the district delivery system was recognized by state and federal agencies as an effective vehicle for delivering assistance to landowners. In fact, districts were named lead local implementation agencies for agricultural nonpoint source pollution programs in some 38 states. The Experimental Rural Clean Water Program projects, begun in the late 1970's and early 1980's as an offshoot of the 1977 amendments, often utilized districts to deliver both technical and financial assistance to land users in high priority watersheds. Similarly, many of the state Clean Water Act Section 319 nonpoint source management programs recognize the conservation district delivery system as the best way to achieve practical solutions to local nonpoint source pollution problems. In addition, 31 states operate various types of state-funded financial incentives programs that address agricultural and other water quality problems. Many of these programs, which operate through local conservation districts, have been helping landowners with water quality problems since the mid-1970's.

Although traditionally conservation districts have been thought of in terms of their work with agriculture, over the past two decades many have expanded their involvement in a number of other resource areas such as urban erosion and sediment control, stormwater management, forestry, surface-mined reclamation, and lake, coastal and estuarine management initiatives.

NONPOINT SOURCE POLLUTION—THE PROBLEM.

It is widely recognized that runoff from diffuse, or nonpoint sources such as cropland, construction and mining activities, urban streets and lawns, and others had become the principal source of impairment to our nation's waters. The extent and intensity of nonpoint source pollution problems are becoming more evident as state and federal agencies sharpen their abilities to detect pollutants and assess their origins. The most common nonpoint source reported is agricultural runoff, accounting for roughly 60% of impaired lakes and rivers.

Programs to address nonpoint source pollution require a different institutional framework from that of traditional point source efforts. The diffuse nature of the problem renders the command and control approach, used effectively to address point sources, unworkable. By enacting 1987 Clean Water Act Section 319, Congress recognized that the solution to nonpoint pollution lies in state and local action. Section 319 calls for the development and implementation of state nonpoint pollution management programs. Through these programs, and through a number of state-initiated programs, considerable progress has been made in developing the infrastructure needed to control nonpoint pollution. Now that much of the groundwork is in place, a serious commitment of manpower and funding—from local, state and federal governments—is needed to translate the nonpoint agenda into action.

GENERAL PRINCIPLES

The nation's water quality goals must be holistic and should seek to achieve and maintain clean water for all uses. Comprehensive resource management programs that include water quality goals should be developed on a watershed basis, targeting actions where they will do the most good. Pollution prevention should be the foundation of our water quality agenda. Within a national framework, a mix of voluntary action and regulation is needed. Where water quality standards are violated or at risk of being violated, an iterative approach of implementing more stringent levels of runoff management measures should be required. Monitoring and assessing the state of our water resources are needed to provide accountability for state and local program efforts, as well as to target limited resources to the most pressing problems. Information and education, and technical and financial assistance must be utilized to empower all segments of society to address water quality problems. Funding, from all levels of government, must be increased to match the scope of the problem.

NACD recommends that we continue the strategy set forth in Section 319 whereby states are delegated authority under federal legislation to develop management programs responsive to local needs and conditions. The management programs should continue to emphasize technical and financial assistance coupled with educational programs. Site-specific nonpoint source pollution management plans also should be predicated on technology-based standards that protect water supplies from adverse impacts from nonpoint pollution. The standards should be based on existing or planned use of the water resource and should be developed within a national framework with input from states and various affected communities including agriculture, industry, and conservation and environmental groups.

BASIC APPROACH

The strategy set forth in the current Section 319 is essentially sound: States are delegated authority under federal legislation to develop management programs responsive to local needs and conditions. The management programs should continue to emphasize technical and financial assistance coupled with educational programs. Further, the programs must be predicated on economically feasible and technically attainable standards that protect water supplies from impairment. Section 319 assessment and management programs need to be reviewed for re-approval every five years to measure the progress of the states in achieving their program goals, and to provide for the inclusion of new nonpoint control strategies and technologies.

FEDERAL ROLE

The Environmental Protection Agency (EPA), the principal federal agency charged with water quality protection, should have the overall lead in developing guidance for implementing state nonpoint management programs. EPA's role should include working to increase public awareness of nonpoint problems and solutions, and to assist states in developing incentives and economic opportunities to encourage the adoption of state and local management practices. EPA also should provide technical and financial assistance to states in developing, refining and carrying out their programs.

The U.S. Department of Agriculture should be designated to assume a strong role in providing technical and educational assistance to state and local governments, in carrying out their programs. The Soil Conservation Service, in cooperation with local conservation districts, should provide technical assistance to land managers as they develop and carry out comprehensive resource management plans.

STATE ROLE

States, operating within the overall guidance set by EPA, should have the lead role in setting priorities and developing the program mix that works best for the specific problems, as well as the social and economic conditions, for the individual state. State programs should continue to emphasize educational and outreach activities to raise public awareness of nonpoint pollution, and their role in solving and preventing nonpoint problems.

States also need to provide technical and financial assistance and incentives to land managers in addressing nonpoint problems. Backup regulatory mechanisms, such as "bad actor" provisions in the programs, also should be included in a state's program mix. Specifically, conservation district approved farm-level resource management plans should be required for all producers in watersheds where surface water bodies or groundwater systems are impaired or where there is a significant probability that these water bodies or systems will become impaired due to agricultural pollution. These plans should be developed based on an integrated evaluation of options for environmentally sound cropping systems and nutrient, pest, water, livestock and sediment management.

LOCAL ROLE

Local government will have the principal accountability in carrying out nonpoint pollution control programs. Conservation districts, with technical assistance from the USDA Soil Conservation Service, should have the lead responsibility for local implementation and plan approval where their expertise is the best—in agricultural, urban and forestry programs. The state and local programs should emphasize development and implementation of comprehensive resource conservation and management plans that address the full range of nonpoint source pollutants.

It is critical that both state and local governments have the flexibility in nonpoint pollution control programs to respond to unique local and regional factors. Because of factors such as climate variations, differing institutional arrangements among state and local government agencies and other widespread variations across the

nation, state and local management entities need wide latitude to develop program mixes that best fit their own individual needs and situations.

FUNDING

Lack of adequate funding is one of the chief impediments to more effectively addressing nonpoint problems. Congress should fund Section 319 grants to states at a minimum level of \$500 million per year. Congress also should greatly expand USDA's water quality program funding and responsibilities under Section 319. The bulk of Section 319 funds should be made available to states for carrying out the management programs mandated by the Act. Additional funds also should be made available to the Soil Conservation Service to provide increased conservation technical assistance for local implementation efforts. After the state revolving loan fund programs required by the Act have been fully capitalized in 1994, Congress should retain the roughly \$2 billion per year Clean Water Act funding to continue addressing ongoing point and nonpoint source pollution problems.

S. 1114

Our comments on S. 1114 reflect an initial staff review of the bill. Our national committee system is currently reviewing the document and will be able to provide more detailed comments in the future.

Overall, NACD supports the approach taken in S. 1114. We believe that building on the foundation of the current Section 319 is a sound direction in which to steer the nation's nonpoint pollution control efforts. State leadership in developing and implementing nonpoint programs, as well as the strong program role suggested for substate regional and local agencies and organizations will be essential to the success of this effort.

Specifically, NACD supports establishing state water quality monitoring programs with technical and financial assistance from the federal government. States need more and better data on where water quality problems exist and what the major contributors are. With respect to the state water quality monitoring councils, NACD recommends that they include representatives of affected user groups: agriculture, silviculture, mining, construction. We also recommend that conservation district and state conservation agency representatives should be included on the state council since they will play an important role in carrying out the state nonpoint management program.

NACD and conservation districts strongly support the watershed-based approach outlined in S. 1114. Conservation districts have been practicing and advocating this program approach for more than 50 years. We're also pleased to see specific recognition of conservation districts as possible management entities for watershed management units.

NACD supports the inclusion of trading schemes, but not as outlined in S. 1114. We believe they should be strictly voluntary and should not allow a point source permit to be more permissive at the expense of nonpoint sources. We believe that water quality gains need to continue for both point and nonpoint sources.

The foundation of the conservation district philosophy is that all land users should have a comprehensive site-specific conservation plan in order to prevent environmental degradation from soil erosion, nutrient and pesticide runoff and other sources. We believe that states should be encouraged to develop voluntary, incentive-driven programs that combine education and technical and financial assistance, to persuade land users to work with their local district to develop and implement these plans before pollution problems occur. Although we generally favor this unprescribed approach, we also believe that, in impaired or threatened watersheds, land users who fail to comply with voluntary programs should be required to develop site-specific, technology-based conservation plans.

With respect to the time frames outlined in S. 1114, NACD maintains that 180 days is an unrealistic deadline for the publication of guidances under the act. As evidenced by the lengthy delays in publishing guidances under the 1990 Coastal Zone Act Reauthorization Amendments, six months is far too short a period to allow sufficient public and user group input.

The time frame for state program revisions is also too short. Again, NACD believes that there needs to be ample opportunity for input by the public and affected user groups in developing revising state nonpoint programs.

Given the proliferation of different water quality initiatives in the past few years, program coordination will also be critical to the success of this program. The act and the guidance need to clearly instruct agencies such as EPA, USDA and NOAA to work together closely in carrying out the mandates of the Clean Water Act and ensure that it works to complement, rather than compete with, initiatives such as

Coastal Zone Act Section 6217, the Farm Bill water quality initiatives and ongoing state and local nonpoint programs. States also need to be encouraged to coordinate the different nonpoint program elements within the program such as the coastal, urban, agriculture and forestry components. Resources are too scarce and budgets too tight to duplicate program efforts.

NACD strongly supports the increased funding levels authorized under S. 1114 and we urge the Congress fund these programs at the levels authorized. The planning and implementation for thousands of water quality plans will create a tremendous workload for federal, state and local conservation and resource management agencies. The technical assistance delivery system is already severely strained by the 1985 and 1990 Farm Bills, as well as the many ongoing state and local conservation initiatives. The Coastal Zone Act and Clean Water Act, will only add to that.

In funding this new initiative, it is important to recognize significant increases in technical assistance will be needed to help land managers implement the required management measures and site-specific plans. This will mean not only adequately funding the Section 319(h) grants and other Clean Water Act authorizations, but also providing significant increases in technical assistance from agencies such as EPA and the USDA Soil Conservation Service. If Congress isn't serious about funding this program, NACD recommends that it be scaled back to a level that can be reasonably accomplished with the funding that is available to carry out its mandate.

NACD supports allowance regional variations in the development of management measures. There are vastly different conditions across the country that will require many different program mixes for water quality efforts to be successful. In addition to regional flexibility, local program flexibility also will be critical for the attainment of nonpoint program goals. Differences in social, economic and political institutional arrangements, as well as vast climate variations across the nation mean that each state and substate and locality needs to have enough flexibility to tailor a nonpoint program to its specific needs.

Overall, NACD believes S. 1114 is a good starting point for building on Section 319 and other ongoing federal, state and local nonpoint source pollution management efforts. For the past six years we've been running Section 319 essentially as a demonstration program, funding it at only a very basic level. We believe it's time to move the nation's water quality agenda another step forward.

Thank you for the opportunity to share our association's views.

TESTIMONY OF ROB OLSZEWSKI, REPRESENTING AMERICAN FOREST AND PAPER ASSOCIATION

Mr. chairman and Members of the Subcommittee, my name is Rob Olszewski, Manager of Forest Hydrology for the Georgia-Pacific Corporation. While I am testifying today on behalf of the American Forest and Paper Association (AFPA), the national trade association of the U.S. forest products, pulp and paper industry, I am also a small non-industrial landowner in Florida and a professional forester formerly employed with the Florida Forestry Association and the Florida Division of Forestry.

BACKGROUND

Our industry accounts for 7 percent of all U.S. manufacturing output. AFPA's member firms directly employ 1.6 million workers in the growing of trees, the manufacture of forest and paper products, and the recovery and recycling of paper products. Collectively, the industry injects \$43.5 billion into local economies and ranks among the top ten employers in 46 of the 50 states.

Unlike many industries, we are regulated for point discharges from our manufacturing facilities and subject to nonpoint Best Management Practices (BMPs) from our forest lands. Needless to say, our interest in S. 1114 is quite substantial. For example, we estimate the point source control section of the bill will cost our industry well over \$10 billion in capital costs and \$1 billion annually in operating costs. An enormous sum for a capital intensive industry such as ours.

Although this hearing is confined to issues affecting nonpoint source runoff, we request, with your permission, Mr. chairman, to submit a longer statement for the hearing record which details our serious concerns with a number of other provisions in the bill.

NONPOINT SOURCES

It has been estimated that at least 50% of all water pollution comes from nonpoint sources. If we are to achieve water quality improvements, then it is appropriate to consider additional approaches in this area.

Unlike others, the forest industry, which includes small woodlot owners, has been implementing nonpoint source Best Management Practices—what is in effect called “management measures” in S. 1114—for a number of years. Since passage of the 1972 Clean Water Act, all states with significant forest management activities have either passed forest practice laws or developed BMPs, approved by EPA to minimize the impact of timber harvesting on water quality.

Consequently, forest activities contribute relatively little to water quality impairment as opposed to other land activities. According to EPA, forestry contributes, on average, only six percent of the loadings attributed to nonpoint source pollution. Beyond the “quantity” issues, there is also the issue of “quality”—and runoff from forests has been demonstrated to be much cleaner than from other types of land uses as well.

With regard to forestry, we ask you to move forward with extreme caution in any nonpoint legislation, to consider what approaches are working well now, and to avoid a Federal regulatory approach that will result in land-use planning.

First, we urge you to recognize the highly successful efforts already being made by those now implementing management measures, particularly in silviculture management.

State reporting requirements under Section 305(b), State best management practices and auditing programs, and EPA's Section 319 reports and studies conducted by the National Council of the Paper Industry for Air and Stream Improvement, all confirm forest management activities as a de minimis contribution to nonpoint source water quality impairment.

Many audits have been conducted to demonstrate the effectiveness of state forestry nonpoint control programs.

For example, Florida inspections indicate 94% compliance with BMPs, Virginia has achieved a 90% compliance, and South Carolina shows an 85% compliance. These rates have been achieved under existing programs and can be improved with additional education, outreach on the part of the states and the industry.

Notwithstanding these statistics, the forest industry is committed to further implementation of best management practices on all forested lands across the country.

Second, BMPs are, and should continue to be, developed on the basis of state-specific characteristics. AFPA generally supports the approach taken by the National Governor's Association (NGA) and the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA), which calls for a state-based, “bottom-up” approach in developing and implementing BMPs.

Each state has its own unique circumstances of landownership types, land-use, state resources and program costs, existing state statutes and social/institutional characteristics.

Because all state programs reflect these characteristics, AFPA would oppose the concept of allowing EPA to establish “Program Implementation Criteria” in section 304 of the bill for all states based on the demonstrated success in only one state.

For example, Florida's new forestry BMP program, which I helped develop, was designed for Florida and would likely not work well in Idaho. Likewise, applying Pacific Northwest practices or implementation criteria to the Northeast, Great Lakes or South would not be reflective of these regions of the country.

Although the bill gives discretion to the Administrator through the EPA Regions to modify management measures to reflect special conditions “in the region,” we are concerned that this authority might be unworkable since even the geographical features within the States of the various regions differ greatly. States—not EPA—must have the flexibility to devise management measures to address their own special circumstances.

Third, any nonpoint source program should avoid prescriptive land-use planning. We are deeply concerned over the application of the water quality criteria and standards provisions of the bill to nonpoint sources. Implementing BMPs is one thing, but having the Federal government telling private landowners if, when, and where to harvest timber is inappropriate and unnecessary.

The antidegradation section in particular, requires designation of any water body within a national forest or any water of “exceptional recreational, cultural or ecological significance, including any that supports a population of threatened and endangered species,” would drastically affect our ability to harvest timber on millions of acres of federal and private land.

Under this bill, would the entire Columbia River system and all its watersheds be included as outstanding national resource waters? What about the St. Johns River that supports the endangered manatees or the Potomac which supports bald eagles? If so, what would be the consequences for land-based activities in those watersheds?

Would foresters, farmers and ranchers be required to modify their activities so as to protect existing uses, or in the case of water quality that exceeds standards, to maintain those levels?

Despite the implementation of management measures on lands adjacent to national resource waters, we believe timber harvesting in these watersheds could be effectively stopped on the grounds that operations were degrading water quality—even if small amounts of soil were discharged into the water as a result of the operations.

A situation such as this could make the ongoing controversy over the timber supply in the western United States pale by comparison—not only in the Northwest, but in many other parts of the country as well. These are very troubling issues for us and we would like to work with the Committee to address them.

AFPA's membership believes that the only practical and feasible method to protect water quality and ensure the protection of beneficial uses is through state-devised implementation of forestry BMP programs.

Finally, any new program should include effective management measures for all nonpoint sources. Identifying a small, select group of "easy targets" will not result in measurable water quality improvements and will only place a disproportionate burden on those covered in the program.

WATERSHED PLANNING

Watershed analysis and management concepts can provide useful tools for addressing regional and site specific water quality problems. Not only does substantial authority already exist in the Clean Water Act to implement watershed planning approaches, but activity is also occurring on a local level in nearly every part of the country.

While watershed analysis and management can be utilized by the states as a screening and coordinating tool to identify and address impaired waters, this section greatly expands watershed evaluation from in-stream water quality parameters to associated land areas including sensitive habitats, wildlife habitat and general land-use patterns.

Although the watershed provisions in S. 1114 are voluntary in nature, the planning requirements, which must be adopted by the states, raise the potential for land-use restrictions on private landowners. If watershed planning were used to impose federal land-use restrictions on landowners, such as restricting legitimate timber harvesting activities, or controlling residential or commercial development, businesses, private landowners, and their communities could be severely impacted.

The strict application of nonpoint source water quality criteria through a watershed approach is not appropriate to land use activities. To guarantee compliance with water quality criteria, given unpredictable weather events, natural background loads and to pinpoint causes and effects when many other activities are occurring both upstream and downstream, is not scientifically or technically feasible.

With each watershed containing potentially thousands of private landowners and facilities, the assignment of pollutant loadings becomes an extremely impractical and inefficient exercise in a given watershed, assuming loads could be fairly and accurately measured in the first place.

AFPA is also concerned about the Federal consistency provision which would require Federal agencies to carry out their activities in a way which is consistent with watershed management plans. For example, would this provision affect timber sales in national forests; any federal permitting activity, or affect the relicensing of small hydropower projects? If so, we would strongly object to its inclusion in the bill.

For these reasons, we urge the Committee to continue its review of the Act's current authority prior to S. 1114's modification later this year, as well as a review of the watershed management activities already underway, to see if less resource intensive and more practicable approaches can be taken.

CONCLUSION

In conclusion, Mr. chairman and Members of the Committee, AFPA appreciates this opportunity to share its views with you on these issues. AFPA has a strong interest in the development of the clean Water Act amendments. We look forward to working with you to develop sound policies that recognize existing authorities in the Act, and that address remaining water quality problems in the most efficient and least disruptive manner.

TESTIMONY BY WILLARD DE GOLYER, DAIRY FARMER, NATIONAL COUNCIL OF FARMER COOPERATIVES

Mr. Chairman and members of the Subcommittee, my name is Willard De Golyer, and I am accompanied by Dr. Stanley Weeks. We are pleased to testify today on behalf of the National Council of Farmer Cooperatives and appreciate the opportunity to share our views on reauthorization of the Federal Water Pollution Control Act.

I am president of Table Rock Farm, Inc., which I operate with my uncle, Calvin De Golyer. Our farm is located near Castile, New York, which is in Wyoming County, west of Rochester. We have a milking herd of 650 cows and plant 600 acres of corn and alfalfa, and are currently constructing a new milking facility and increasing the herd size to 850 milking animals. I also serve on the New York State Working Group on Dairy Manure Management and am a participant in the Animal Science Advisory Committee at Cornell University. We have been working for some time to implement environmentally beneficial best management practices in our operations, including improved manure handling systems. I am an active member of Agway Inc., our regional farm cooperative, and often turn to my cooperative for information and technical assistance on environmental concerns.

Dr. Stanley Weeks is Director of Agway's Farm Research Systems and Product Development, and he is an internationally recognized expert in the science of manure management. Among his many notable contributions is the development of a biogas systems approach to dairy manure management.

The National Council of Farmer Cooperatives (National Council) places a high priority on development and implementation of policies that maintain and enhance the quality of surface and ground water resources through effective management of NPS pollution from agricultural activities, where problems are identified, in a manner compatible with food and agricultural policy objectives.

Farmers and their cooperatives have a great deal at stake in the water quality policy debate. Farmers are directly impacted by both point source (e.g., livestock and poultry confinement facilities, etc.) and nonpoint source (NPS) pollution policies and requirements. Farmers are also impacted by the significant point source requirements placed on farm input manufacturing and food processing facilities owned and operated by their cooperatives. To the extent that incremental costs related to point source requirements translate into reduced earnings for the cooperative business, farmers are impacted either through reduced patronage dividends or a reduction in the value of their investment in the cooperative.

Our cooperative community is committed to playing a constructive role in the search for effective solutions. The National Council's comments today will be focused in particular on measures directed to agricultural NPS pollution, as proposed in Title III and other sections of S. 1114, the "Water Pollution Prevention and Control Act of 1993."

Our Environmental Policy Committee's analysis of toxic and point source measures contained in S. 1114 is still underway, and we expect to submit written comments on Title II, Title V and related sections for the Subcommittee's consideration in the near future.

INTEREST OF THE NATIONAL COUNCIL

Description of Membership:

The National Council is a nationwide association of cooperative businesses which are owned and controlled by farmers. The National Council represents about 90 percent of the nearly 4,500 local farmer cooperatives in the nation, with a combined membership of nearly 2 million farmers. National Council members handle practically every type of agricultural commodity produced in the U.S., market these commodities domestically and around the world, and furnish production supplies and credit to their farmer members and patrons.

- Cooperatives are in the important business of manufacturing and supplying farmers with fuel, fertilizers, crop protectants, feed, seed and other important farm inputs. Cooperatives supply about 40 percent of all fuel, fertilizers and other production inputs used by American farmers.
- About one-fourth of the fruits, nuts and vegetables on supermarket shelves, and ultimately on dinner tables, arrives there through the efforts of cooperatives.
- Cooperatives account for over three-fourths of the milk and a large portion of the cotton, wheat, feedgrains, oil seeds and rice produced and marketed in the United States.

Agway Inc.:

Agway Inc. is a cooperative owned by 91,000 farmer members in 12 northeastern states—Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, and Vermont. Agway is headquartered in Syracuse, New York.

Agway produces and markets crop needs and services, dairy & livestock feeds, farm-related products, pet food and supplies, and yard & garden products. Its operations are conducted by more than 7,000 customer-oriented employees. Agway is a major diversified business, with consolidated sales of \$3.3 billion last year. Internal and external subsidiaries are involved in food processing and marketing, energy products, leasing, insurance, and other businesses.

MANAGING AGRICULTURAL NPS POLLUTION

EXHIBIT 1 is a "Statement of Principles" endorsed by the National Council and other agricultural organizations, which we believe identifies the NPS challenge confronting agriculture and conveys important concepts which form the basis for effective solutions. The National Council's participation in the ongoing clean water policy debate is being guided in large part by these important principles.

Briefly stated, NPS pollution concerns involve trace levels of pesticides and nutrients (principally Nitrogen and Phosphorus) which are being detected in some water bodies at levels deemed to exceed acceptable levels under standards set by the Clean Water Act and other statutes. One of the potential sources of concern frequently cited is that of NPS pollution from agricultural operations (Note: Off-farm sources are also recognized in the debate, including septic systems, urban landscapes, natural vegetative decay, etc.).

In framing the policy debate about how to address management of NPS pollution from agriculture, a brief review of (1) roles of key agricultural inputs that are regarded as potential sources of pollution, and (2) elements that the National Council believes are key to their successful management may be helpful to the Subcommittee.¹

Nutrients and Crop Protection Chemicals Critical to Production Agriculture:

- *Nutrients* are basic building blocks that both plants and animals require in order to grow and survive. Natural soil nutrient replenishment processes include decay of organic matter, siltation (flood plains) and lightning and rainfall. Although *nitrogen* (N) is but one of 16 elements essential for plant growth, it is one of the most critical, in that yields are generally proportional to the amount of N available.
- Natural supplies of N and phosphorous (P) in the soil are limited, and can be quickly depleted. These nutrients must be replenished and often supplemented to achieve acceptable yields on a sustainable basis. A number of sources of *supplemental nutrients* are available to farmers, such as manure, crop rotations (legumes and green "manure" crops), commercial fertilizers, sludge, etc.
- Pesticides are *crop protectants* which comprise critical tools in the farmer's arsenal to supplement crops' natural defenses against a host of predators, competitors and diseases, which can cause major losses to the detriment of both farmers and consumers. Crops in the U.S. must compete with 10,000 species of insects, 1,800 different weed varieties, 18,000 species of fungi and 250 viruses. Even with effective use of all crop protection tools, nature's competitors typically cause a 25 percent yield reduction.

¹ EXHIBIT 2 is a white paper entitled "Crop Nutrients and Water Quality," which was developed under auspices of the National Council's Environmental Policy Committee in an attempt to address these two dimensions for nutrients. Major points are summarized in this testimony as they apply to both nutrients and crop protection chemicals.

- The judicious use of supplemental plant nutrients and crop protection chemicals has helped American agriculture realize a *doubling of yields* in the past four decades.
- As a result, agricultural producers have been able to respond to the growing food and natural fiber needs of an expanding population on reduced acreage, thus averting environmental pressures on more fragile lands that otherwise would be brought into production.

Ingredients to Successful Management of NPS Pollution from Agricultural Operations:

The National Council is sensitive to the need for American agriculture to be part of the solution in managing NPS pollution. We believe that the operative goal of any successful policy response is as follows:

To maintain and enhance the quality of surface and ground water resources through effective management on the farm and in the field of NPS pollution from agricultural activities where problems are identified, in a manner compatible with food and agricultural policy objectives.

Based on cooperatives' experience in working with farmer-members, American farmers are generally anxious to be a constructive part of the NPS pollution management solution. Speaking for my own family, we are firmly committed to being part of the solution.

However, given financial and other resource constraints in much of American agriculture, we cannot succeed alone. There must be a *shared burden*—a partnership—in responding. Farmers' basic needs are three-fold:

- Sound Information on what works;
- Technical Assistance in tailoring solutions based on site-specific best management practices; and
- Financial Assistance, particularly for more capital-intensive options.

Sound information is critical, as cooperatives can speak from long experience in that it is difficult to over-emphasize the importance of maintaining credibility. Farmers want good information on remedies that work. Not just their crop for that year, but often their livelihood and way of life, may be at risk. One has to be wrong only once to destroy farmers' trust for years to come, dealing a serious setback to NPS management programs, whether voluntary or mandatory.

Technical and financial assistance are geared to achieving actual results in the field, where the success or failure of any initiative to manage NPS pollution from agriculture will ultimately be determined. These results will be dependent upon recognition of the following interdependent factors:

- All nutrient sources can potentially cause NPS pollution, whether they exist naturally or are added to the soil; and therefore *all sources must be properly managed.*
- To reduce N and P contamination, a *systems policy approach* is needed to ensure that reductions in one source are not offset by increases in another. The systems approach requires careful examination of both ag and non-ag, as well as both point and nonpoint, sources.
- *Existing ag-environmental initiatives*, such as those implemented pursuant to the 1985 and 1990 Farm Acts, offer significant potential for managing NPS contamination. Unfortunately, insufficient or even no funding has been provided in many instances.
- Adoption of *Best Management Practices (BMP's)*—practices shown to give maximum productivity, input efficiency and environmental protection—holds significant potential to address nutrient contamination and, at the same time, help contribute to the financial viability of the farm enterprise. *Integrated Pest Management (IPM)* programs offer similar benefits for crop protection chemicals.
- *Time* is needed to evaluate the results of programs that are already underway—time for farmers to implement BMP's, and time for the environmental benefits to show up in water bodies.
- Finally, and perhaps most importantly, *farmers must be financially viable* to implement NPS pollution management programs.

S. 1114

While the National Council has significant concerns about specific provisions contained in S. 1114, the sponsors are to be applauded for making great strides in crafting comprehensive legislation whose conceptual approach on complex and potential

ly controversial issues is generally sensitive to the special needs and concerns of American agriculture.

In discussions with staff to date regarding specific concerns, the National Council has often found that upon clarification we may agree with the intent of provisions in question. However, we do feel that more work needs to be done to ensure that intent is clearly stated in such cases, and ultimately realized upon practical implementation.

In today's testimony, we would like to (1) express our understanding of the bill's structural approach to agriculture's role in managing NPS pollution; and (2) based on that understanding, identify issues of concern and offer recommendations, including the critical area of funding.

Title III's Structural Approach to Ag NPS Pollution Management:

Title III of S. 1114 recognizes the realities of resource constraints both in government and agriculture by targeting impaired watersheds. States are to take the lead, so that water quality management initiatives are undertaken by people at the local level who are in the best position to craft workable solutions. These are fundamentally important steps that we applaud and endorse.

Farmers not in targeted watersheds will not be required to implement water quality management plans. We would point out that many farmers outside of targeted watersheds will still be adopting BMP's voluntarily for economic and environmental reasons, as well as due to Conservation Compliance Plans (CCP's) required under the 1990 Farm Act, Coastal Zone Management Act (CZMA) provisions, etc.

State Planning. In general, states are given 2.5 years to classify water uses, identify and delineate problem watersheds and revise comprehensive management plans designed to achieve water quality standards. The plans are subject to EPA approval. Groups may seek additions to the list through a citizen petition process. These first steps represent an ambitious undertaking likely to require a substantial commitment of resources by state governments. Since subsequent stages involving agriculture hinge upon how these actions are carried out, we would be interested in states' view regarding whether there will enough time and resources to comply and avoid the more onerous default option.

First 5-year period. States are given up to three years in the first five year implementation period (starting 2 years after enactment) to work with farmers to develop and approve site-specific water quality plans. A state-designated agency is to work with individual farmers in the target watershed to develop site-specific BMP's. Participation equals farmer compliance. Participation presumably means implementation of the site-specific plan, not just approval. If a CCP is in place, the farmer has met requirements. Also, it is our understanding that a farmer could still implement a CCP to comply.

Second 5-year period. At the end of the first five years, states are to take a fresh look based upon upgraded monitoring data and determine whether water quality standards are being achieved. If not, a second stage triggers, with various sources of pollution (point and nonpoint), including agriculture assigned load additional reduction requirements deemed necessary to bring the watershed into compliance by the end of the second 5-year period. Watershed planning units would conform with U. S. Geological Survey delineations. Minimum state enforcement authorities would be strengthened to include injunctive powers.

Funding. To facilitate these steps, S. 1114 authorizes increased funding for Section 319, increased flexibility for use of Section 319 grants and dedication of a portion of state revolving funds (SRF's) for NPS investments. Authorization for Section 319 funding would increase to \$600 million by 1999. Up to 20 percent of \$3 billion annually in SRF funds could be used for NPS investments. It is unclear, however, whether farmers would be eligible or, if so, what criteria they would have to meet.

Issues and Recommendations:

The National Council believes that S. 1114 can evolve into a final product that can truly allow agriculture and cooperatives to be a partner in the effort to achieve national water quality objectives. Our concerns and recommendations that follow are directed to that end.

Site-Specific, Flexible, Coordinated. The sponsors of S. 1114 have indicated that the goals of water quality plans as applied to agriculture are (1) to be site-specific, (2) to be flexible, and (3) to be coordinated with other programs. The National Council concurs. Achieving these goals is essential to successful implementation, and we applaud the sponsors for that commitment. They are so important that we would urge they be specifically emphasized in key sections of the bill to ensure these goals carry through to the implementation process.

Coordination. S. 1114 provides that CCP's fulfill phase 1 requirements. We would recommend that the Subcommittee consider inclusion of other programs which represent credible water quality management efforts, such as CZMA, Chesapeake Bay, etc. Perhaps those identified in H.R. 2543 could serve as a useful point of departure.

Number of Farmers Impacted. Important to the issue of resource and time requirements is an assessment of how many farmers will fall into impaired watersheds. However, we do not yet know the geography of these watersheds; nor is there a clear indication of how states may use their discretionary power in designating uses. Furthermore, we do not know how many states will opt not to go the watershed route, with all farmers then subject to regulation. Without such information, our comments concerning adequacy of time frame and funding are necessarily constrained.

Funding Priorities.

If nonpoint source pollution is believed to be a major priority in achieving clean water objectives, are disbursements of available funds commensurate with that view?

About \$75 billion in federal, state and local funds have been contributed toward sewage treatment construction projects alone in the past two decades. By contrast, funding directed to managing NPS pollution has been minuscule; and at this juncture there are no initiatives evident that would alter this imbalance. Will the policy process ultimately generate resources—even if it involves redirection of existing allocations—for NPS pollution management commensurate with the challenge, as has been the case for municipal projects? The National Council looks forward to working with the Subcommittee as future deliberations focus on this important question.

While agriculture is supportive of efforts to maintain and enhance the quality of our water resources, we are concerned about the potential cost. This is because agriculture, unlike other industries, cannot readily pass on such increased costs in the form of higher prices. While some BMP's intended to manage NPS pollution will mean cost savings over the long run, many will represent increased costs of production. Even those that may reduce costs will in many cases pose major capital investments that may be beyond the financial means of the farmer.

For these reasons, we are pleased that the bill provides for increased funding and expanded authority for both the Section 319 and State Revolving Fund (SRF) programs to help offset and/or restructure such costs. Since grants are likely to be somewhat limited, we believe consideration should be given to establishing special loan guarantee programs to help farmers, cooperatives and other eligible borrowers obtain necessary financing for environmental improvements. Such a program would help stretch limited federal and state resources while serving to encourage a private/public sector partnership. It appears that S. 1114 moves in this direction, and we would like to work with the Subcommittee in exploring ways to make the program more effective.

The legislation's proposed authorization for Section 319 would essentially double present authorization levels, and that is welcome news. Still, compared with funds allocated to municipal sewage, the amount is de minimis by comparison, particularly when the bill targets NPS pollution as the "number one" priority in the reauthorization process. Unfortunately, while we will commit to supporting appropriations, funds appropriated have consistently lagged well below that authorized due to budgetary constraints; and we are concerned that this trend will continue.

The expanded eligibility of Section 319 to include some grant assistance for farmers implementing proven practices is a positive development, although the practical effect will likely be limited. We would urge that grants be more commensurate with the cost of some BMP's. For example, on the point source side, \$5,000 would make little difference in the decision, or ability, to install concrete or steel holding tanks for animal wastes. By contrast, significantly more assistance was made available to a number of farmers in the Chesapeake Bay, with positive results. We would urge the Subcommittee to explore potential environmental benefits of larger grants in selected circumstances.

Phase 1 Focus. The National Council interprets this legislation as promoting a partnership between federal/state government and the farm community. Our priority objective is to work with the bill's authors so that everything possible is done to achieve water quality management objectives in the first phase (first 5-year period as proposed), in the hope that as few farmers as practicable are subject to increasingly prescriptive and costly load reduction requirements that could result in the second phase.

Time Problems. In analyzing S. 1114, we are concerned that the prescribed time frames and commensurate funding levels are such that most if not all farmers are

likely to find themselves subject to phase 2 (second 5-year period) requirements regardless of their best efforts. We know of no similar outreach program that even begins to approach any sort of implementation success rate in the time frames proposed.

We question whether states will be able to meet the initial proposed deadlines, particularly since appropriations from the federal level intended to assist state efforts and on-farm implementation are likely to fall short of targets. Yet this would not relieve farmers of their obligations. The bill calls for states to work with farmers in target watersheds so that all have approved management plans no later than the end of the third year in phase 1. Experience would suggest that a large number of farmers won't have plans approved and implemented until near end of the first 5-year period at best.

There is generally a significant time lag involved between the adoption of BMP's and water quality improvements showing up in the monitoring data. We are concerned that even if all goes well in terms of timely implementation of BMP's on farms, the initial 5-year review will lead to a conclusion few water bodies are in compliance. This could lead to calls for mandatory programs.

We question how close to the end of the 5-year period monitoring data will be available for determination of progress toward compliance. Data could well predate implementation of BMP's pursuant to the Act.

These factors combined lead us to the unhappy conclusion that water bodies are unlikely to come into compliance in the first 5-year period. Only CCP's or other BMP's implemented earlier and independently of Clean Water Act requirements will be in place to yield desired results. Yet the deadline for CCP's being in place is 1995.

Time Frame Recommendations. A farmer failing to live up to the partnership proposed in S. 1114 is faced with penalties, including under injunction authority and other enforceable powers of the state. Yet what if, for example, states fail to work with farmers to accomplish approved management plans? The National Council would propose that the Subcommittee consider building in mechanisms to ensure that farmers are not penalized if other components of the government/farmer partnership fail.

The Subcommittee could build in time a lag reflective of (1) performance by states of their charge; (2) the availability of needed funding; and (3) time needed for BMP's to yield water quality results. It should be an operative goal that states are to be timely in working with farmers, so that farmers aren't penalized by tardy response on part of the state.

Section 304(e) Criteria. This section provides that the EPA, in cooperation with USDA, is required to establish animal waste management facility design guidelines. Farmers and others may submit facility plans to the EPA. Once approved by EPA and USDA, the plans are eligible for funding provided under Title VI. Also, USDA is authorized to provide technical assistance.

In general, the proposed animal waste management facilities program provides considerable opportunity to livestock producers to deal with NPS pollution. The legislation recognizes the responsibility of the federal government to provide financial and technical support to farmers to address the NPS problems identified and others.

It should be recognized that farmers have been installing animal waste management facilities for many years. Their primary motivation has been to address material handling problems. For example, winter weather conditions in the Northeast states make it nearly impossible for dairy farmers to make daily applications of manure on their farms. As a result, many Northeast dairy farmers have built animal waste management facilities to address this material handling problem.

To achieve NPS pollution benefits, it makes good sense for animal waste management facilities to be tied to a nutrient management or whole farm management plan. Such plans recognize the fertilizer value of properly stored manure. The animal waste management facilities can be designed for adequate storage taking into consideration appropriate timing of applications of the manure to farm fields based on the nutrient needs for crops that will be grown on those farm fields.

The National Council would offer the following recommendations to strengthen Section 304(e):

- Rather than require the EPA to establish facility guidelines, we would suggest that EPA be authorized to establish "performance" guidelines. This would allow for engineering flexibility to address individual farm situations while ensuring a consistent achievement of environmental objectives. For example, EPA could set as a performance guideline that there be no leakage of animal waste from a storage facility, with consultants and builders then required to ensure that

proper materials and construction techniques are used to meet that and other criteria.

- Over the past 20 years, the federal government has spent over \$60 billion to build sewage treatment plants to deal with human waste management concerns. A similar commitment to dealing with animal waste management has been virtually nonexistent. While the proposed legislation does provide funding in this direction, the federal commitment is extremely small, and eligibility criteria are very restricted. We would urge a greater financial commitment and would further recommend that eligibility criteria be expanded to allow for the use of federal funds to help pay for private sector technical assistance, biogas digester systems, and liquid-solid separator systems.
- We recognize that USDA alone, through the Soil Conservation Service, cannot serve the needs of all farmers. Farmers are increasingly turning to their cooperatives for assistance. We would recommend that the Subcommittee ensure that provisions for financial assistance include services provided by cooperatives to farmers. This would be consistent with current use of Section 319 funding which allows for municipalities to hire private sector consultants for technical advice and design of publicly-operated treatment works.

Specificity as a Potential Funding Barrier. We would urge the Subcommittee to be sensitive to the danger that requirements associated with access to grants/loans will become so prescriptive that they could unintentionally become barriers to funds needed for site-specific investments by preventing the much needed flexibility that the bill's authors recognize as necessary for site-specific planning. Furthermore, requirements associated with funding could mean that farmers would be forced to hire consultants or outside contractors, when perhaps by doing it themselves they might do the job at a far lower cost.

Costs for Regulated and Regulator. It is our understanding that the Office of Management and Budget (OMB) and the Congressional Research Service (CRS) have been asked to analyze the costs associated with this legislation, both for government and the regulated community. We urge timely completion of this analysis so it can be factored into assessment of the adequacy of proposed funding levels.

Consideration of Economics. The bill defines the term "management measures" as '*economically achievable* measures for the control of additional pollutants from existing sources and new sources . . .' (emphasis added). The National Council applauds the specific recognition of economics as applied to agricultural operations, particularly since there seems to be a general consensus that farmers must be economically viable to adopt BMP's. We would suggest that the term 'control' be replaced with the term 'management,' given the significant difference in legal connotation associated with each.

Citizen Petitions. The legislation would permit citizen petitions as a means of adding water bodies to states' target lists for action. Since S. 1114 provides for extensive public input into the initial decision process, we question the need for this second step. Although the petitions would have to meet certain criteria, they are unspecified. If the provision is retained, we would urge further clarification, at least in terms of criteria.

Volunteer Monitoring. The National Council understands and appreciates the provisions calling for volunteer monitoring. This is consistent with our view that creative means be sought to maximize available resources. In some instances, we could see where farmers and cooperatives would want to participate in the monitoring of their water resources. For example, agriculture in a given watershed may want to provide data more current than a state has the resources to generate to demonstrate water quality improvements due to recently adopted BMP's. It should be made clear that farmers and cooperative personnel would be eligible to participate in volunteering monitoring programs.

In order to assure maximum utility of this resource, the National Council would urge the Subcommittee to direct the EPA to develop criteria for types and quality of data that would be suitable for consideration by states. Otherwise, data of inconsistent or poor quality could be misused, with scarce resources misdirected as a result.

Use Designations. S. 1114 provides the opportunity for states to develop their own use designations, according to water bodies' intended use, with the default being the Clean Water Act's fishable/swimmable standard. The National Council strongly endorses this approach.

Water Quality Standards. The National Council remains concerned that provisions calling for *biological monitoring, conversion of narrative to quantitative standards* and related matters could have the unintended result of more stringent standards, subjecting more watersheds and farmers to potential regulation, and triggering more stringent and costly requirements than intended.

For example, does biological mean looking at native species as a signal for taking a closer look at other indicators? If so, what criteria would be utilized in selecting the water body/ecosystem as a reference point? Could the provision be used to introduce sensitive, non-native species as an environmental indicator that could trigger regulatory or enforcement action?

Staff has responded by indicating that such provisions are intended to augment, not elevate, current standards. While refining existing standards may be appropriate, we would like to continue working with the Subcommittee to thoroughly examine these provisions, with modifications and additional clarification as necessary to ensure that current standards are indeed enhanced and not elevated.

New Sources. Agriculture is appropriately excluded, except for construction of significant animal feeding facilities.

Guidelines and Handbook. To ensure that needed flexibility is retained during implementation at the local level, the Subcommittee should work to ensure that these general references are not used as rigid, prescriptive criteria.

Giving BMP's Time to Work. We would urge that S. 1114 make it clear that one reasonable conclusion during evaluation regarding NPS pollution load reduction requirements is that water quality standards can be achieved if BMP's already implemented are given more time to work.

Potential Politicization of Phase 2. Part of the National Council's desire to see phase 1 (first 5-year period) be successful is based on uncertainty over how phase 2 will operate. In addition to not knowing how stringent requirements will be, we are concerned about politicization of the process envisioned where all sources in a watershed are to get together and "agree" about what sources are contributing how much to the problem, and how much load reduction each is required to contribute. With one-half of the value of agricultural production in Standard Metropolitan Statistical Areas (SMSA's), or in counties immediately adjacent to SMSA's, urban-oriented politics could force scientifically unmerited burdens on agriculture.

Watershed Delineation. Senate staff has indicated that the intent is to require that watersheds under phase 2 conform to the USGS definition. We support this intent and urge that staff ensure this is clearly stated in the bill.

"Good Actor" Philosophy. The Subcommittee faces a critical philosophical choice in its search for policies that will achieve nonpoint source pollution management objectives on the farm. Should the emphasis be on "command-and-control," with imposition of solutions reinforced by penalties? Or should the emphasis be upon voluntary, incentive-based measures? We are pleased that the sponsors of S. 1114 have selected the latter path, and we would urge the Subcommittee to build upon that beginning.

There may well be a place for both approaches over the long term. However, at this stage in the process, the National Council would strongly urge that the latter approach be used as the framework for policies targeting nonpoint source pollution and agriculture. The emphatic message being sent to cooperatives by their farmer-members is that they are aware of NPS pollution concerns being raised by others and directed toward agriculture, and that they are anxious to be part of the solution, in ways that allow them to remain in business and deal with the complexities of agriculture and natural processes.

We respectfully submit that far more environmental gains for funds invested will be achieved by seeking a partnership with the overwhelming majority of farmers who are willing to respond, especially in light of likely financial shortages and the uncertain and highly variable nature of NPS management responses. In seeking to impose requirements at this juncture on farmers who may be regarded as "bad actors," one risks alienating the willing population, and diverting disproportionate funds away from education and assistance to enforcement. The superfund debacle, with most funds going to attorneys instead of to cleaning up sites, is an experience not to be repeated in the water quality arena.

Citizen Suit Exemption. The National Council strongly supports the exemption provided for in S. 1114 for farmers from citizen suit authority in Title III. We would caution that if citizen suits were to carry over to lenders instead, the unintended effect could be to dry up farmers' access to funds.

Enforceability. States are required to have an enforceable provision, with injunction power in phase 2. Does injunction power mean that the state can shut down a farm operation? It is not clear whether this power is regarded as a first or last resort. We would recommend that the provision be dropped or if retained make it clear this significant power is to be used only as a last resort.

Innovative Solutions Need to Be Explored. Recognizing that there will never be enough resources needed to accomplish important water quality objectives, the National Council would urge that creative and flexible alternatives be explored, rather

than imposing costs of mandated regulatory solution on farmers. For example, the EPA has done some good work on pollution trading that may be applicable to agriculture.²

ONGOING COOPERATIVE ENVIRONMENTAL INITIATIVES

A number of innovative initiatives, principally built around environmentally beneficial Best Management Practices (BMP's) and Integrated Pest Management (IPM) programs, are already underway, with promising results, as illustrated in part by the summary of a 1989 member survey contained in EXHIBIT 3. We are aware of a number of additional new programs that have been initiated since the survey was conducted.

Cooperative Research Efforts:

We in the Agway system are particularly excited about developments in animal manure management at our research facility that we believe offer the potential to contribute a great deal in responding to water quality challenges. The Agway Farm Research Center was first opened in 1967. Today there are nearly 500 tillable acres and a 500 head registered Holstein herd. In addition to being a working laboratory for testing Agway products, Dr. Weeks and his team of researchers have tested and demonstrated BMP's in both crop and dairy operations.

Agway is also a member of Cooperative Research Farms (CRF), an organization made up of 12 cooperatives throughout the U.S., Canada and France.³ These cooperatives pool research facilities, knowledge and dollars to maximize benefits to farmer-members, including in the environmental arena. This multi-cooperative effort means that information on such advances, both at our research farm and those of other cooperatives, can often be of benefit nationally and internationally. While the foundation for the effort is animal feed research, with CRF members representing combined sales in excess of \$4 billion annually, research farms include environmental and other objectives in their systems-oriented approach.

Agway's Biogas Systems Approach to Manure Management:

One successful project under the stewardship of Dr. Weeks may be of particular interest to the Subcommittee, as it highlights the fact that environmental solutions on the farm are rarely simple, but instead require a systems approach that often must take into account seemingly unrelated factors before hoped for results can be achieved.

Dr. Weeks' team has worked for a number of years on the challenge of handling manure on a working dairy farm, looking for alternatives to enhance more traditional approaches. As they went up the learning curve, they came to realize that any workable solution must begin with the cow and consider all facets in the dairy operation, including nutritional needs, barn temperature, the farmer's pocket book, and even the cow's creature comforts. The biogas system that they have developed can, under the right circumstances, turn a dairy farmer's environmental challenge into a cost-effective energy and revenue source, while at the same time yielding important water quality and other environmental benefits.

Agway is continuing to make significant progress in working to make the system more cost-effective and compatible to a wider range of operations. Dr. Weeks is available to provide further details and respond to any questions. Furthermore, Agway would be pleased to provide a personal tour for any members or staff who would like come to our research farm and take a closer look.

COOPERATIVES AS PART OF THE SOLUTION

The National Council wishes to emphasize a strong desire to work with the Subcommittee in developing policies that enable American agriculture and the farmer cooperative community to be an effective and active part of the NPS pollution management solution. We applaud the strong beginning that S. 1114 represents in ap-

² EPA, "Administrator's Point/Nonpoint Source Trading Initiative Meeting—A Summary, EPA 841-S-92-001, August 1992.

³ CRF members are Agway Inc., Syracuse, NY; Countrymark Cooperative, Inc., Indianapolis, IN; Atlanta, GA; GROWMARK, Inc., Bloomington, IL; Land O'Lakes, Inc., St. Paul MN; Southern States Cooperative, Inc., Richmond, VA; Tennessee Farmers Cooperative, La Vergne, TE; Co-op Atlantic, Monton, New Brunswick, Canada; Cooperative Federee de Quebec, Montreal, Quebec, Canada; Federated Co-operatives Limited, Saskatoon, Canada; Gold Kist, Inc. UCAAB, Chateau Thierry, France; United Co-operatives of Ontario, Mississauga, Ontario, Canada.

plying the principles that we believe are required for American agriculture to be an effective part of a successful water quality program.

Comments offered today on S. 1114 are intended to move this important policy document closer to the goals that we share with the Subcommittee. Proposed improvements are based on our best understanding to date of the bill's provisions. Our Environmental Policy Committee's Water Quality Legislative Task Force is continuing to analyze S. 1114's individual provisions, as well as how they might ultimately interact when implemented on the farm. As our understanding improves, so too hopefully might the value of additional observations and suggestions.

If the National Council could leave this Subcommittee with one lasting impression from our testimony today beyond our specific suggestions for improving S. 1114, it is that agricultural cooperatives are uniquely positioned to be part of the solution. Cooperatives work in partnership with the farmers and ranchers who are their member-owners as they strive to address NPS pollution and other environmental challenges.

Farmer cooperatives are a prominent and integral part of this nation's agricultural landscape and culture. Farmers began banding together through cooperatives early in this century, combining their individual limited resources to address both input and marketing challenges as a means of helping them remain viable as farmers. Although specific needs may have changed greatly over the years, this role remains the basic charge of cooperatives.

Today, four out of five farmers belong to one or more cooperatives. Cooperatives by definition are self-help organizations. In the search for water quality solutions, cooperatives offer an invaluable outreach capability.

This Subcommittee is already painfully aware that resources at the federal and state level, as well as in agriculture, are far too scarce to accomplish all that we might like in the water quality arena by starting from scratch. Our earlier comments underscore this reality. Thus, we would urge that the Subcommittee look for means of augmenting and energizing existing resources and outreach systems, such as those in cooperatives. Incremental investments in such systems could yield tremendous environmental benefits more quickly than might otherwise be possible. Toward this end, we have offered a few suggestions in this testimony regarding cooperative resources and hope to identify other opportunities as the process moves forward.

In closing, the National Council stands ready to work with the Subcommittee in advancing water quality legislation that brings to life a true partnership between agriculture and government in responding to NPS pollution challenges. Dr. Weeks and I are available to respond to any questions members of the Subcommittee may have.

SUMMARY

The National Council of Farmer Cooperatives believes that the operative goal of successful agricultural NPS pollution management policy is to maintain and enhance the quality of surface and ground water resources through effective management on the farm and in the field of NPS pollution from agricultural activities where problems are identified, in a manner compatible with food and agricultural policy objectives.

There must be a shared burden—an agricultural/government partnership—in responding. Farmers' basic needs include sound information on what works; technical assistance; and financial assistance to achieve site-specific BMP's.

S. 1114 is comprehensive legislation whose conceptual approach on complex and potentially controversial issues is generally sensitive to the special needs and concerns of American agriculture. It is targeted to impaired watersheds; places states in a lead implementing role; and relies on site-specific BMP's.

The National Council recommends that S. 1114 be strengthened to encourage timely agricultural adoption of BMP's in impaired watersheds. Evaluation of progress should be compatible with implementation of key program components.

Specific recommendations include (1) increase funding through Section 319 and SRF targeted to agricultural NPS pollution management initiatives, with expanded eligibility; (2) allow sufficient time for programs to work before conducting evaluation that could trigger imposition of more stringent provisions on agriculture; (3) link agricultural accountability to performance on part of states and funding levels; (4) ensure flexible guidelines in Section 304 program and funding eligibility manure management systems contributing to enhanced water quality; (5) make certain that biological monitoring and conversion of narrative to numerical standards accomplishes intended goal of refining, and not increasing, existing water quality stand-

ards; and (6) maintain the bill's focus on directing limited resources to "good actors" in agriculture as the primary means of achieving NPS pollution management objectives.

One example of how farmer cooperatives are uniquely positioned to be part of the solution is Agway's biogas systems approach to managing dairy manure. Cooperatives work in partnership with the farmers and ranchers who are their members-owners as they strive to manage NPS pollution. S. 1114 should be strengthened to take advantage of resources offered by the cooperative system.

The National Council stands ready to work with the Subcommittee in advancing water quality legislation that brings to life a true partnership between agriculture and government in responding to NPS pollution challenges.

EXHIBIT 1

PRINCIPLES STATEMENT OF THE CLEAN WATER ACT WORKING GROUP CLEAN WATER ACT REAUTHORIZATION

In the reauthorization of the Clean Water Act, Congress should adhere to the following principles:

1. The Clean Water Act (CWA) does not stand alone in protecting America's waters from nonpoint source (NPS) pollution. Other ongoing programs at the federal, state and local level must be funded fully, coordinated with and not superseded by the CWA. This includes, in particular, the soil conservation and water quality provisions of the 1985 and 1990 farm acts and the state groundwater and surface water protection programs of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).
2. Recognizing the 20-year commitment our country has had to eliminating point-source pollution, success in reducing the more complex and diverse NPS pollution will require similar time and resource commitments. However, management of this problem will require a different approach than that of point source pollution elimination because, unlike point source pollution, NPS pollution is primarily a weather-related phenomenon that can be managed, but not feasibly eliminated. NPS pollution is caused by the inadvertent discharge of pollutants from a wide variety of society's most essential activities.
3. The central focus on NPS management solutions should be a reasonable and voluntary approach based on incentives, education and technical assistance as the primary means of managing NPS pollution.
 - NPS pollution management program should (a) emphasize the protection of water resources and state-designated water uses, including state-designated agricultural uses, and (b) recognize the importance and needs of individual agricultural producers and other landowners affected by the CWA.
 - This approach emphasizes the use of locally designed and applied, economically feasible, site-specific best management practices which do not infringe on private property rights. Implementation of these farm management options over a realistic time frame will further the goal of reaching or maintaining designated uses of water bodies.
 - It is inappropriate to link USDA commodity, conservation or disaster program payments to the success or failure of management programs for NPS pollution authorized under the CWA.
4. Current CWA language contains valuable provisions for NPS management embodied in Section 319. Although this NPS section has been historically underfunded and has been hampered by bureaucratic roadblocks, all states now have approved Section 319 assessments and approved management programs. Within the CWA, it is the preferable vehicle for management of NPS pollution, and changes which occur during CWA reauthorization should reinforce these existing NPS provisions.
 - The proper management of NPS pollution lies in state and local efforts. As such, states should continue to identify and resolve their priority NPS water problems through administration of Section 319 funds. With state oversight and approval, local organizations should continue to carry out these NPS programs. Agencies at the federal and state levels should harmonize objectives and coordinate funding for national and regional NPS management programs.
 - State and local programs should provide for a mix of research, development, education and technical and financial assistance for both planning and implementing actions aimed at achieving state designated uses.

5. Management efforts funded by Section 319 of the CWA should be directed to priority areas based on scientific assessments that identify water bodies with impaired or threatened uses.
 - Priority, as determined by states, should be based on the magnitude of risk to human health, the protection of designated uses, and likelihood of further significant and unreasonable water quality degradation if no action is taken.
 - Strategies should be developed on a hydrologic unit, watershed-wide basis using an approach that includes the consideration of both surface and ground water quality.
 - Programs should focus on cost-effective, site-specific practices for individual operations with flexibility for implementation.
 - In order for Section 319 to work effectively for agriculture, USDA must play a lead role in the delivery of education and technical assistance at the state and local level.
6. An effective and cost-efficient response to water quality problems requires accurate and reliable information on (a) the source, extent, and impact of NPS pollution, as well as (b) the effectiveness, utility and economic feasibility of conservation measures and best management practices.
 - Any Clean Water Act reauthorization should include a strong financial commitment to further research, monitoring and assessment projects.
 - Monitoring should include before and after sampling as well as frequent sampling during storm events and assessment of natural and historic loadings.
 - Scientific research and monitoring projects should follow protocols developed by the US Geological Service and should be conducted on a watershed basis with local and state input.
 - Representative pilot projects aimed at achieving market based incentives on a watershed or regional level should be encouraged.
7. The Clean Water Act Reauthorization should not directly or indirectly create a federal water quality law or program which supersedes, abrogates or impairs state water allocation systems and water rights.
8. Section 319 management programs on federal lands should be developed and implemented by the specific agency statutorily charged with management of the lands in question, rather than by regulatory authorities independent of that agency.
9. It is inappropriate for a reauthorization of the Clean Water Act to provide the authority for citizens suits against individuals participating in NPS management programs.

CROP NUTRIENTS AND WATER QUALITY

INTRODUCTION

Detection of crop nutrients (principally nitrogen and phosphate) in ground and surface water supplies has been a mounting public concern. Research indicates these compounds come from numerous sources, both natural and man-made, and the primary sources of contamination are not yet known. Nonetheless, the use of nitrogen and phosphorus fertilizers in agricultural production has led to increasing public scrutiny of farmers and farm production practices.

The National Council of Farmer Cooperatives (NCFC) represents more than 2 million U.S. farmers and the cooperatives they own. Nearly 50% of the nation's farmers purchase fertilizer through cooperatives. In addition, farmers (through their cooperatives) own approximately 25 percent of all commercial fertilizer production capacity.

The purpose of this report is to discuss non-point source (NPS) pollution of ground and surface waters, the factors involved, and recommendations for addressing the problem. The report is divided into the following sections:

- Executive Summary
- The NPS Problem
- The Role of Crop Nutrients in Agriculture
- The NPS Solution

EXECUTIVE SUMMARY

The NPS Problem

- There are many potential sources of nitrates and phosphates in water, such as decaying organic matter, manure, atmospheric lightning, commercial fertilizers, and septic tanks.
- Evidence on the scope of NPS pollution is most prevalent for nitrates. The EPA's National Survey of Drinking Water Wells found 1.2% of community wells and 2.4% of rural wells contain nitrate in excess of EPA standards.
- Environmental concerns from nitrogen and phosphates center on eutrophication—stimulated growth of algae in surface waters. Both nutrients can cause eutrophication.
- For human health, nitrate concerns center on "Blue Baby Syndrome," a condition affecting infants. However, no cases have been reported in recent years, and national health organizations no longer keep statistics on it.
- Phosphates pose few, if any, known threats to human health, according to scientists.
- Potassium, another major crop nutrient, generally is not a health or environmental concern.

Role of Crop Nutrients in Agriculture

- There are 16 essential elements for plant growth. Nitrogen and phosphorus (along with potassium) are the elements used in the largest quantities.
- The natural supply of these elements in soil in forms available to plants is limited, and must be supplemented to maintain crop growth and productivity for a wholesome, abundant, reasonably priced supply of food.
- Many sources of supplemental nutrients are available, such as manure, sludge, commercial fertilizers, and crop rotations. Whether natural or manmade, all can potentially cause NPS pollution and all must be properly managed.
- Commercial fertilizers offer numerous benefits to both producers and the environment. Advantages include the capability to measure, time and place nutrients for maximum plant uptake and benefit, and thereby minimize groundwater leaching and erosion runoff.

The NPS Solution

- To effectively manage nitrate and phosphate contamination, a systems policy approach is needed to ensure that reductions in one source are not offset by increases in another. The systems approach requires careful examination of both ag and non-ag, as well as both point and non-point, sources.
- For new ag-environmental policies to be effective, producers will need sound information, as well as technical and financial assistance to implement desired practices. If government makes NPS the focal point of water policy, government funding needs to reflect this change.
- Recent ag-environmental policies, such as those of the 1985 and 1990 farm bills, have significant potential for addressing NPS contamination. The problem is little or no funding has been provided in many instances. Moreover, time is needed to evaluate the results.
- Adoption of Best Management Practices (BMPs)—practices shown to give maximum productivity, input efficiency and environmental protection—has significant potential to address nutrient contamination, and, at the same time, ensure the financial viability of America's highly efficient and productive farm sector.

Specific Recommendations

1. The numerous ag-environmental programs adopted in recent years need to be properly structured and administered, and fully funded in order to reduce NPS contamination and mitigate the need for additional policy responses.

2. If new water quality programs are developed, farmers must be provided with sound information and additional financial resources to adopt site-specific BMPs.
3. New policy proposals must be cognizant of imposing additional costs on farmers. In light of large cuts in farm support programs in recent years, farmers have extremely limited capital resources. Farm programs may see additional cuts in the near future.
4. Any new policy proposals must be designed to ensure maximum environmental protection at minimum cost. New programs should make ample use of provisions such as pollution credits and trading between point and non-point nutrient sources, to allow affected parties maximum flexibility in meeting specific water quality goals.

PERCENTAGE OF WELLS THAT CONTAIN NITRATE IN EXCESS OF THE STANDARD

COMMUNITY WELLS

1.2% EXCESS

RURAL WELLS

2.4% EXCESS

THE NPS PROBLEM

Nitrates can potentially pose a threat to human health, but no incidents have been reported in recent years. Both nitrates and phosphates can cause eutrophication, damaging surface water bodies. There are many potential sources of both nutrients in water.

- For nitrogen, sources include:
 - decaying organic matter
 - manure/sludge
 - atmospheric lightning
 - commercial fertilizers
 - legume crops/immature grasses
 - septic tanks.
- For phosphate, major sources include phosphate-containing detergents, natural sources, and farm inputs (manure, commercial fertilizer, etc.).
- All nitrogen sources—both organic and inorganic—can leach nitrates into ground water systems or, through soil erosion, convey nitrates into surface waters, such as lakes and rivers. All phosphate sources potentially can contaminate surface water bodies. Because phosphate binds tightly to soil, it is generally not a ground water risk.
- Potassium, another major crop nutrient, creates no known quality problems for surface waters, and generally does not pose a contamination problem for ground water systems (CAST, 1992).

SCOPE OF THE NPS PROBLEM: NITRATES

EPA Water Well Survey (Ground Water)

- The National Survey of Drinking Water Wells conducted during 1988-89 estimated about one-half of the nation's wells contained traces of nitrate (NO₃), but the vast majority were below the maximum contamination level of 10 parts per million (ppm) nitrate as N.
- EPA found nitrate in excess of the standard in 1.2% of the nation's community wells and 2.4% of rural wells.

Des Moines River Study (Surface Water)

- The Leopold Center for Sustainable Agriculture at Iowa State University found that nitrate levels in the Des Moines river were nearly as high in 1945 as for 1980-90.
- The study shows that the nitrate problem in the river significantly pre-dates the use of commercial fertilizers, which did not become widespread until the 1960s. The results are particularly important as Iowa is one of the largest states for fertilizer use.

Specific health and environmental concerns include:

- Eutrophication
 - Eutrophication occurs when algae growth is stimulated in surface water bodies.
 - Nitrogen and phosphorus can contribute to eutrophication. Phosphorus is an essential (and generally lacking) nutrient in the growth of algae.
- "Blue Baby Syndrome" (Methemoglobinemia)
 - Digestive tracts in infants up to 6 months of age are naturally low in acid. When coupled with excessive consumption of nitrates, this can prevent proper oxidation of infant blood cells, and lead to Blue Baby syndrome.
 - Modern society has virtually eliminated Blue Baby risk. From 1947-49 (*long before significant agricultural use of commercial fertilizers*), Minnesota reported 139 cases and 14 deaths, attributed to high nitrate levels in farm wells. Since 1960 only one case has been reported in the nation. The cause was a shallow farm well located too near a septic tank system and barnyard.
 - Because occurrences are so rare, major U.S. health organizations (National Institute of Health, National Center for Disease Control) no longer keep statistics on it.
- Few, if any, adverse human health effects have been linked to exposure to high levels of waterborne phosphates (Klaassen, 1986).

SCIENTISTS ESTIMATE U.S. CORN YIELD WOULD BE CUT BY MORE THAN 40 PERCENT WITHOUT SUPPLEMENTAL N.

THE ROLE OF CROP NUTRIENTS IN AGRICULTURE

Crop nutrients are essential to agriculture. Commercial fertilizers are an important source of nutrients, offering farmers several environmental and economic advantages. However, fertilizers are only one nutrient source, and all sources must be managed to minimize NPS.

There are 16 essential elements for plant growth. Nitrogen and phosphorous (and potassium) are the elements used in the largest quantities.

- Nitrogen is *the* most essential crop nutrient, playing a key role in cell division and raising protein content. It is the nutrient most frequently deficient in agricultural soils.
- Phosphorus, although not required in large quantities, is also deficient in some soils. Phosphorus is essential for cell division, photosynthesis, utilization of sugar and starches, and energy transfer.

The limited supply of these nutrients in the soil must be supplemented. Many sources of supplemental nutrients are available, and whether natural or manmade, all are potential NPS contaminants.

- To maintain farm productivity and a plentiful, reasonably priced food supply, modern agriculture requires the addition of crop nutrients. Without supplemental nitrogen, corn yields, for example, would fall 40 to 50 percent (Hoeft, 1990).
- Before the advent of modern agriculture, too often the soil was "mined" of its naturally occurring nutrients and then abandoned.
- Between the introduction of crop hybrids and the use of fertilizer, U.S. corn yields, have increased nearly 250% since 1950. Wheat yields have climbed almost 150%.
- Curtailing the use of supplemental nutrients would reduce productivity and could draw environmentally sensitive lands into production, boosting soil erosion and worsening the NPS problem.
- Commercial fertilizers are just one component—albeit an important one—in nutrient management. Other important sources of supplemental nutrients include legumes, manure, crop rotations, green manure, sludge, and numerous others.
- All sources have equal potential to contribute to NPS pollution.

U.S. FOOD PRODUCTION CAPABILITY AND FERTILIZER USE

SOURCE: THE FERTILIZER INSTITUTE, 1982

When used properly, commercial fertilizers can provide environmentally sound, economically efficient nutrients for crop production.

- Commercial fertilizers are man-made, but the chemical interaction with plants is *exactly* the same as an organic product such as manure. Fertilizers are produced from, and break down into, naturally occurring compounds.
- Commercial fertilizers offer many important advantages, including the capability to measure, time and place nutrients for maximum plant uptake and benefit. In that way, fertilizer use can minimize groundwater leaching and erosion runoff.
- Commercial fertilizers are economical, providing farmers with crop nutrients at relatively low cost—particularly in terms of capital and labor costs.
- Animal manure and sludge can be productive elements in nutrient management but must be carefully managed, particularly as they pose special challenges for NPS pollution: In addition to nitrate and phosphate, these sources can spread microbial diseases in waters (CAST, 1992).

THE NPS SOLUTION

New programs to deal with NPS should be multifaceted, involving systems-based policies, sound information, technical and financial assistance for producers, and further development and promotion of Best Management Practices.

The systems policy approach is needed to ensure reductions in one source are not offset by increases in another. The systems approach requires careful examination of both ag and non-ag, as well as both point and non-point, sources.

- The systems approach means that the agricultural production process must be examined in its entirety when developing and implementing specific policy actions.
- A non-systems approach—policy that focuses on reducing one or two specific sources—could, unintentionally, increase use and contamination from other sources, leaving overall contamination unchanged or even worse.
- Non-system policies that dramatically reduce agricultural productivity—e.g. policies that restrict nutrient use and reduce crop yields, or that require excessive rotations and reduce overall farm output—could easily push production onto more erosion prone, environmentally sensitive lands.

In rural areas, improving ground water systems requires addressing nitrates from non-ag sources.

- According to the Council on Environmental Quality (1980), home septic systems are a larger source of ground water contamination than farming. Septic systems release nitrate by design.
- Septic systems remain the primary sewage control method in most rural areas (Perkins, 1984).
- EPA estimates 25% of the housing units in the U.S. are served by some 22 million septic units (1986).

For new policies to be effective, producers will need sound information, as well as technical and financial assistance to implement desired practices.

- New policies, developed to reduce ag-related NPS, must focus on farmers as the target audience, and must be designed accordingly.
- If NPS is the policy focus, resources must be reprioritized. At present, the vast majority of government resources is allocated to addressing contamination from point sources.
- Investment in research and education will be needed to develop new technologies/practices that minimize agriculture's contribution to NPS, and to assist producers in incorporating new technologies on individual farms.
- In order to implement new practices, farmers must be economically viable. Additional resources will be required to support new practices, particularly if large-scale implementation is expected.
- Farmer cooperatives are already working with producers, promoting environmentally beneficial practices, and stand ready to further assist with the adoption of new, proven technologies/practices. Cooperatives play a unique role in agriculture and are well positioned to facilitate adoption.

Recently-adopted ag-environmental policies have significant potential for reducing contamination of ground and surface waters. The problem is that only partial funding has been provided. Moreover, time is needed to see results.

- The 1985 Farm Bill contained a number of important environmental provisions, and the 1990 Farm Bill went even further. Important non-farm bill programs have been initiated as well.

- Policy objectives have centered on
 - reducing soil erosion and runoff
 - maximizing efficiency of input usage
 - promoting Best Management Practices—environmentally safe, sustainable, economically efficient practices.
- Many of these programs have received little or no funding since being passed. For some, regulations have not even been promulgated.
- Even the best funded programs are relatively young, and their impact on water quality is only beginning to be seen.

Adoption of Best Management Practices (BMPs) has significant potential to address nutrient contamination. A BMP system requires total integration of all inputs into the system and is inherently site specific.

- BMPs are those practices that are already proven in research and tested through farmer implementation to give optimum production potential, input efficiency and environmental protection.
- A BMP system involves both conservation and agronomic practices.
- According to the Council for Agricultural Science and Technology (1992), research studies indicate that nutrient and other non-point source contaminants are reduced by implementation of BMPs.
- Increasingly, farmers are looking to extension personnel from land-grant universities, as well as numerous USDA agencies, to gain information on BMP technology and how to apply it to their farms.

THE NPS SOLUTION: SPECIFIC RECOMMENDATIONS

1. The numerous ag-environmental programs adopted in recent years need to be properly structured and administered, and fully funded in order to reduce NPS contamination.
 - USDA programs must be coordinated, to gain maximum environmental benefit.
 - Education and promotion programs should be developed to ensure farmers are aware of program goals, requirements, and benefits.
 - Evaluation systems should be implemented to determine which are most environmentally effective and economically efficient for both taxpayers and farmers.
 - Fully funded, these programs can substantially mitigate the need for additional policy responses.
2. If new water quality programs are developed, farmers must be provided with sound information and additional financial resources to adopt site-specific BMPs.
 - Proposals should encourage, through economic incentives, the use of BMPs—rewarding farmers for good soil stewardship and sound crop management.
 - Research and extension programs should be a major part of any new proposals, to develop, demonstrate and promote BMP technology.
 - BMP technology is inherently site-specific, because of differences in soils, growing seasons, weather patterns, etc. To reflect this, BMP research should be “bottom up” in nature, incorporating significant farmer input.
3. Policy makers must be cognizant of imposing additional costs on farmers.
 - Farmers are short on resources, especially capital resources, in the face of large cuts in farm support programs in recent years. Farm programs may see additional cuts in the near future.
 - The farm population continues to decline, and additional, policy-related cost pressures could cause a precipitous drop in population.
 - Even small cost increases could spell financial ruin for a large number of producers.
4. Any new policy proposals must be designed to ensure maximum environmental protection at minimum cost.
 - New programs should allow affected parties maximum flexibility to meet environmental goals, making ample use of provisions such as pollution credits and trading. This flexible, market-based approach (like that contained in the 1990 Clean Air Act) has been shown to be effective, from an environmental as well as a cost perspective.
 - Pollution trading and credits should be allowed among both point and non-point sources.

- Numerous successful market-oriented policies have been used by state and local governments to combat water quality problems, as demonstrated by North Carolina and New York City.

APPENDIX: AG-ENVIRONMENTAL POLICIES

Agricultural Water Quality Protection Program (1990 Farm Bill)

- Participants must follow Best Management Practices consistent with a USDA-approved water quality protection plan, which includes reporting input usage, and conducting soil and tissue tests for each year of the 3 to 5 year agreement.
- Producers receive incentive payments of up to \$3,500 per person, per year; cost-share assistance of up to \$1,500 per person, per contract; and technical assistance in developing/implementing plans.
- Farm program payment yields and acreage bases are protected on enrolled acreage.
- Eligible lands include:
 - well-head protection areas
 - land deemed critical as per section 319 of the Federal Water Pollution Control Act
 - areas of shallow Karst topography where sinkholes allow runoff to directly enter ground water supplies
 - other areas identified as environmentally sensitive by EPA, USDA, and the Departments of Interior or State.
- When created, the AWQPP's goal was to enroll 10 million acres by 1995, but lack of funding makes it questionable as to whether the program will meet that target.
- What little funding the program has received has come from other USDA conservation programs.
- At this date, USDA is unable to say exactly how much acreage is enrolled.

Conservation Reserve Program (1985 Farm Bill)

- The CRP was designed to remove highly erodible land from agricultural production for 10 years. Enrolled acreage must be planted to a USDA-approved cover crop or trees/shrubs.
- Participating producers receive annual "rental" payments from USDA and cost-share assistance.

- The goal for total CRP enrollment is 40-45 million acres by 1995. (Significant acreage considering total principal crop acreage last year was 319 million acres.)
- Enrollment in the CRP has gradually increased to the current 36 million acres.
- With changes made via the 1990 Farm Bill, the CRP has an increased environmental focus. Explicit goals now include improvement of ground and surface waters.

Wetlands Reserve Program (1990 Farm Bill)

- Designed to return farmed or converted wetlands back to a wetland environment.
- Participants must agree to long term easements. Easements can be permanent, for 30 years, or the maximum allowed under applicable state laws.
- Similar to CRP, producers receive annual "rental" payments from USDA.
- Enrollment goal is 1 million acres by 1995. Current enrollment is approximately 50,000 acres.

Conservation Compliance (1985 Farm Bill)

- Requires all farmers with highly erodible land to develop USDA-approved conservation plans designed to minimize soil erosion and runoff.
- Implementation must be completed by January 1, 1995.
- The 1990 Farm Bill expanded potential penalties for violating conservation compliance. Farmers violating the provision could be denied virtually all USDA payments/benefits.
- Approximately 40% of U.S. farmers, and 140 million acres, are affected.
- Less than 2% of highly erodible land is not covered by a compliance plan.
- To date, approximately 60% of plans have been implemented.

Environmental Easement Program (1990 Farm Bill)

- Purpose is to reduce the impairment of water quality and provide long term protection of environmentally sensitive lands.
- There is no acreage mandate for the program.
- Long term easements will be offered to landowners through 1995.
- Eligible lands include:
 - acreage enrolled in the CRP that is likely to return to production after the CRP contract expires and would pose an environmental threat
 - areas containing riparian corridors
 - environmentally sensitive areas that would be in violation of State or Federal environmental goals if cropped.
- Participants agree to implement a natural resource conservation management plan, recorded deed restrictions, and permanently retire any existing base and/or allotment history.
- Participants receive 100% cost sharing for establishing conservation measures, and easement payments for up to 10 years. Payments can total up to \$250,000.
- Because no funding has been appropriated, USDA has not accepted any acreage into the program; in fact, USDA has not even promulgated program regulations.

President's Water Quality Initiative (1989)

- Directs USDA to implement research program to develop new farming systems designed to protect ground water.
- USDA to set-up nationwide demonstration projects promoting various cropping, nutrient/pesticide management, and tillage practices for improved water quality.

Section 6217, Coastal Zone Management Act (1990)

- Goal is to restore and protect coastal waters.
- Each of the 35 states and territories with coastal waters will be required to develop NPS pollution control programs.
- EPA, USDA and other state and federal agencies are currently in the process of developing program guidelines.

Section 319, Clean Water Act (1987)

- Requires states to submit a report to EPA that identifies state waters not meeting water quality standards because of NPS pollution; identifies general and specific nonpoint sources; describes methods for identifying effective BMPs to combat problems; and identifies programs for controlling NPS.
- States are required to develop management plans to address identified NPS pollution problems.

- Implementation of the program has been slow, as little funding has been provided. While all states have now filed assessment reports and management plans, the plans have not yet been approved by EPA.

EXHIBIT 3

SURVEY OF COOPERATIVE ENVIRONMENTAL INITIATIVES ¹

SUMMARY

Farm supply cooperatives were surveyed concerning Promotion of BMP's. Of a population of 25 regional supply cooperatives that the survey was mailed to:

- 18 regional cooperatives informed their local cooperatives of fertilizer BMP's through a variety of means (training courses & seminars, written materials, etc.), using information obtained from USDA, universities, trade associations and their own research efforts. ² Most of the training programs were certified by state agencies.
- 10 cooperatives provided soil test kits to locals. Most indicated that soil tests are free if fertilizer is purchased as a result of tests.
- 12 cooperatives had names for their program promoting BMP's, and 9 had hired agricultural experts to implement the program (others used current employees or hired contractors). 13 regionals worked with the media to promote BMP's.
- 20 regionals indicated their locals inform farmer-members of BMP's, and assist farmers in determining the fertilizer application rate best suited to safeguard the environment and maintain production efficiency. Locals made use of computer models, soil testing, plant tissue analysis, historical application rates and advice from the regional cooperative.
- Of 11 regionals providing estimates on the percentage of farmer-members utilizing BMP's, 8 indicated greater than 50 %, including 4 exceeding 90 %.
- 9 regionals conducted research on fertilizer application rates, including 5 on BMP's; 8 were involved in an experimental farm program. 15 provided financial assistance for university research on BMP's.

Twenty cooperatives primarily engaged in food processing and marketing responded to a parallel survey on *Promotion of IPM Programs*:

- 15 regionals informed locals of IPM techniques, based on information obtained from a variety of government, university and in-house resources. 4 had certified IPM courses. 11 had names to promote their program. 7 cooperatives had hired experts to implement their IPM program.
- 14 regionals indicated their locals review IPM techniques at meetings with farmers.
- 18 regionals assisted farmers in determining pesticide application rates best suited to safeguard the environment and maintain production efficiency.
- 9 cooperatives conducted research on IPM; and 10 provided financial support for university research on IPM.

STATEMENT OF JUDY OLSON, VICE PRESIDENT, NATIONAL ASSOCIATION OF WHEAT GROWERS, GARFIELD, WASHINGTON

Mr. Chairman and Members of the Subcommittee:

My name is Judy Olson, and I am vice president of the National Association of Wheat Growers. My husband and I have raised wheat, barley and lentils in the Palouse region of Washington State for the past 20 years. Today I am also speaking for the American Soybean Association, National Barley Growers Association, National Corn Growers Association, National Cotton Council, and the U.S. Rice Producers Group.

¹ These partial results were derived from analysis of a member survey developed through a joint effort with the USDA Agricultural Cooperative Service and conducted by the National Council in 1989. The National Council assumes sole responsibility for the interpretation of results as presented.

² The reference to "regionals" and "locals" involves organizational structure of cooperative businesses and warrants brief explanation. Generally speaking, while some regional cooperatives are *centralized*, with farmers belonging directly, others are *federated*—i.e., farmers (several hundred to several thousand) are typically members of "county" locals, and locals in turn are members of the regional. Either structure can encompass anywhere from a few counties to a number of states.

I appreciate the opportunity to comment on the nonpoint source title of S. 1114, and those provisions which we feel are of the most direct importance to agriculture.

The goal of improving watershed planning is a central feature of the proposed legislation, and we agree that better identification of impaired watersheds and development of a strategy to manage sources which have been specifically associated with impaired water quality is essential. Where this is already occurring, and where agriculture has been specifically related to water quality impairment, farmers have been willing participants in watershed projects.

Projects established under the Rural Clean Water Program (RCWP) and USDA's Water Quality Initiative exemplify high levels of farmer participation in cooperative problem-solving efforts. The RCWP, administered by the U.S. Department of Agriculture in consultation with the U.S. Environmental Protection Agency, was initiated in 1980 as an experimental effort to address agricultural nonpoint source pollution in 21 watersheds across the country. Most RCWP contracts began in 1980-81 and ended in 1986. Landowner participation was voluntary, with cost sharing and technical assistance offered as incentives for implementing best management practices. In order to achieve water quality goals established for the watersheds, the required level of best management practice (BMP) implementation on cropland was set by the agencies at 75 percent of the critical area encompassing major pollutant sources—and in all 21 projects this goal was met or surpassed.

Preliminary analysis of participation in the 74 nonpoint source "hydrologic unit area" projects established under USDA's Water Quality Initiative indicates similar participation rates. For example, the Godfrey Creek project in Gallatin County, Montana has 80 percent of the area within the watershed under contract to install recommended BMP's for dairy farming and irrigated cropland. Education and technical assistance were jointly provided by USDA's Cooperative Extension Service and Soil Conservation Service, and cost-sharing made available through ASCS. These agencies have longstanding working relationships with farmers, and a record of successful outreach.

These high levels of watershed project participation lead to two very important conclusions: (1) voluntary, incentive-based programs are successful when correctly administered; and (2) it is not necessary that specific practices be in place on 100 percent of the watershed area in order to achieve significant water quality improvement. The immediate objective of nonpoint source programs, we believe, should be aimed at involving the majority of landowners within impaired watersheds—not necessarily 100 percent. Participation should be encouraged on the basis of technical assistance, education and cost-sharing.

Changes in farming practices in my own area add further support to these conclusions. In the Palouse region of Washington State, where we farm on extremely hilly terrain, farmers have been progressively implementing new practices voluntarily to reduce soil erosion and improve water quality for over 30 years. Following the original enactment of the Clean Water Act in 1972, the Washington State Department of Ecology endorsed a locally developed series of water quality BMP's for farmers in the Palouse, including "divided slope" farming to reduce runoff. Since that time, 200,000 acres in Whitman County are farmed according to the recommended practices. In addition, a regional research and technology transfer project known as STEEP was instituted in the mid '70's, and the project has resulted in the voluntary adoption of minimum-till and no-till systems on over half the acres in Whitman County, where we farm. As a result of these "technology and knowledge transfer" projects and official recommendations by local authorities, every one of the farmers in our area has adopted at least one of these management practices.

In rice producing areas, management practices to improve water quality have also been voluntarily adopted by most farmers. As a result of practices recommended by the Texas A&M University system for the production of rice, most farmers in Texas are holding irrigation water in their fields long enough so that any fertilizers and chemicals that are used in production have degraded or dissipated and other dissolved solids are less than when the water entered the fields. Similar practices are being followed by rice producers elsewhere in the United States.

It is our strong belief that if projects like these were adequately funded, expanded and coordinated with ongoing 319 programs in states, farmers would be enabled to make the management changes necessary to address nonpoint problems identified with agriculture. It is also our belief that more BMP's will be installed at much less cost to both government and individuals under cooperative programs than under enforceable programs which require a policing mechanism. Education is a much better buy than a police force. Funding for the multi-year, 21 watershed RCWP totaled \$64 million, and BMP's were installed on 730,000 acres of cropland. It should also be

noted that many of the projects focused on animal waste containment facilities, which are very costly.

Cooperative projects such as these engage the vast majority of farmers who are "good actors" in watershed management, rather than focusing on the "bad actor". In fact, it has been my observation that those individuals sometimes described as "bad actors" more often than not turn out to be late joiners rather than nonparticipants. A successful watershed project with positive participation from the majority tends to overcome negative attitudes and resistance from conservative individuals who find it difficult to make changes. Cooperative projects also tap the traditional community loyalty that is typical of rural life without relying on threats to achieve positive goals for the community.

Inadequate resources account for the inability of many states to fully activate nonpoint source management strategies. Making adequate resources available to states to develop and implement their 319 programs is essential to achieving the goal of improving watershed planning and involvement of landowners—the "stakeholders" in the watershed. A very important provision of S. 1114 is the substantial increase in the authorization for nonpoint source program funding. It is essential that these increased funds be directed toward improving technical assistance and education programs in the states, and that grants be made available under the State Revolving Fund to individuals to assist them in implementing management practices which are designed to meet the requirements of the legislation.

The ingredients of a successful watershed planning effort are good understanding of the nature of any impairment, defining suitable management practices that will be necessary to address the problem, and aggressive outreach to landowners to ensure their understanding of the problem and the role that they must play in addressing it. We believe that many of these ingredients are provided for in S. 1114, particularly increased funding to states to improve planning, assessment and outreach. The site-specific approach to BMP design for existing sources and requiring economic achievability are also very important.

We believe that local watershed planning authorities, including the state department of agriculture, land grant university agricultural specialists, and local SCS and Extension Service experts are best suited to the task of assessment, site-specific BMP design, and landowner outreach. Each farm operation has unique soil and climatic conditions, in addition to economic conditions which dictate many management decisions which farmers must make. Site-specific BMP's tailored to local conditions can best be designed by technicians and researchers who have a working knowledge of the region. We do not believe that the federal EPA should overshadow this effort by publishing a handbook which local watershed managers must reference when matching farming systems to the water quality objectives of the watershed. Farming according to a national handbook is simply not workable and the handbook called for in the legislation would defeat the purpose of site-specific planning and local problem solving.

Farm law requires farmers with highly erodible land to implement a conservation plan designed and approved by the Soil Conservation Service by 1995. The plans were developed in accordance with the SCS "Field Office Technical Guide". In some instances the Guide and SCS technicians have offered a suitable selection of practices from which the farm operator may choose, but in other instances planning has been inflexible. Farmers can expect an EPA handbook to be a far more inflexible "guide" to farming.

Other means for EPA to maintain effective oversight over state management programs would be more productive, and have already been identified by the agency itself: These include requiring states to do a better job of reporting their progress in meeting program goals and requiring more consistency among state plans.

Importantly, the legislation recognizes the relationship between SCS-approved conservation plans and water quality improvement. Since conservation plans are designed to minimize runoff, the legislation provides for them to satisfy water quality requirements within an impaired watershed for a 5-year period. We are very pleased that the achievements of conservation plans have been recognized, given the enormous efforts and costs that farmers have taken on in order to comply.

However, since plans will not be fully implemented until 1995, they should be given more time to show results. We believe that ten years, rather than five, would be a fairer time frame for allowing conservation plans to satisfy watershed BMP requirements. It has been shown in Rural Clean Water Program and other NPS projects that runoff reduction resulting from BMP installation can sometimes not be quantified in terms of water quality improvement for a period of many years, even though the BMP may be the best available technology. It would be unfair and bur-

densome to require new efforts of farmers before the efforts they are already making have been given a chance to work.

Five years is also an inadequate period of time for watershed planners to assess nonpoint sources and develop appropriate BMP's for landowners in the watershed. And it is not an adequate amount of time to allow citizens to respond to problems that are made known to them and for which they are assigned responsibility—in many cases for the first time—within the framework of a fully functioning cooperative watershed project.

As the watershed planners develop BMP's for the watershed, they should be demonstrated to landowners, and the landowners should be given adequate time to respond and participate in the watershed project. The legislation emphasizes the importance of watershed planning and local "ownership" of watershed projects, and we couldn't agree more. But this philosophy must be made practical with realistic time frames for states and individual citizens to respond to a new federal mandate.

Thank you very much, Mr. Chairman, for your consideration of our views. We appreciate the efforts made by you and the committee to address water quality concerns in the proposed legislation, and we look forward to cooperating with the committee in finalizing a sound nonpoint source strategy for the nation.

TESTIMONY OF PAUL GENHO, CHAIRMAN, PRIVATE LANDS AND ENVIRONMENTAL MANAGEMENT COMMITTEE, NATIONAL CATTLEMEN'S ASSOCIATION

The National Cattlemen's Association is the national spokesman for all segments of the beef cattle industry—including cattle breeders, producers and feeders. The NCA represents approximately 230,000 cattlemen. Membership includes individual members as well as 46 affiliated state cattle associations and 29 national breed associations.

Good morning. My name is Paul Genho, and I am currently Chairman of the National Cattlemen's Association's (NCA) Private Lands and Environmental Management Committee. I am also a rancher from the state of Florida.

NCA appreciates this opportunity to provide testimony before the Senate Environment and Public Works Committee, Subcommittee on Clean Water, Fisheries, and Wildlife, regarding re authorization of the Clean Water Act (CWA). NCA represents approximately 230,000 cattle producers nationwide through 75 affiliated state cattlemen's and national breed organizations. This issue is a priority to NCA members, who earlier this year ranked CWA reauthorization among their top priorities.

Cattlemen across the country are vitally interested in this re authorization of the CWA. There has been no other CWA re authorization, or other federal statute for that matter, which potentially could have such pervasive impact on land and water uses which are fundamental to agriculture. Cattlemen own and manage land which encompasses over half the U.S. land mass; land which exists in widely varying geographic settings and therefore is exposed to numerous climatologic and geologic occurrences. This wide variation in climate and topography makes land management decisions in the state of Florida very different from those management decisions made in other portions of the country. For this reason, broad land use planning provisions made on a national level can be very effective in one locality, but be completely inappropriate for other areas. NCA would urge this subcommittee to keep these local and regional climatological variations in mind as the CWA re authorization proceeds.

The beef cattle business is affected by the CWA in a number of ways. For example, the 635 million acres of privately owned grazing land represents the predominant land use in watersheds across the country. According to USDA, over 85% of U.S. beef cattle raised in feedlots are finished in feedlots which are required to be permitted as point sources of pollution under Section 402 of the CWA. Furthermore, many cattle producers utilize wetlands, during drier months of the year, for haying and grazing. Although Section 404 contains an exemption for agriculture from permitting requirements, many of these producers have been required, and often denied, permits for this beneficial, maintenance use of wetlands. The recently promulgated regulations under the Coastal Zone Management Act prescribe a "one size fits all" approach to non point source (NPS) pollution. By EPA's own estimates, the cost of this NPS approach to the private sector in this narrow band of coastal areas (735 counties) is expected to be at least \$500 million. As stated earlier, this nationwide approach will not provide an effective, cost-efficient means of reducing NPS pollution in these areas, let alone throughout the rest of the country. At the present time, ranchers and farmers across the country are operating under state developed

and driven Section 319 plans which, if given adequate time and resources, could prove to be very effective in reducing NPS pollution.

NCA has been actively involved in the re authorization of the CWA for a number of years. Most recently, we have worked as part of a coalition of over twenty agricultural and conservation organizations to develop a Statement of Principles regarding re authorization of the CWA. This document, attached for your review, outlines those provisions of NPS policy which are necessary for a workable and cost effective CWA re authorization. NCA would urge the Committee to review these Principles, and incorporate those provisions into any CWA re authorization measure.

NCA appreciates the leadership of the Senate Environment and Public Works Committee in drafting legislation for CWA re authorization, S. 1114. NCA has found a number of positive provisions embodied in S. 1114, such as:

A) efforts to ascertain the quality of all "waters of the United States". This is a key provision of any CWA re authorization measure and will, for the first time since the CWA has been introduced, provide an accurate assessment of the quality of surface waters nationwide.

B) expansion of water quality monitoring to a continuous, five-year cycle. This provision enables states to more accurately assess and establish trends for water quality improvements.

C) addressing the management of water pollution from a watershed approach and targeting those watersheds with a demonstrated water quality impairment.

D) recognition of current, ongoing agricultural programs and site specific plans which are expected to protect or improve water quality.

E) the recognition for increased funding levels as necessary for improvements of the NPS section of the Act

F) recognition of states ability to best direct pollution reduction efforts.

NCA appreciates the consideration given to States ability to direct water quality protection. However, there are sections throughout S. 1114 which may undermine the efforts of states by requiring extensive EPA oversight. The provisions in question include:

A) dictating federal numeric criteria for water quality standards.

B) promulgating federal guidance for NPS management measures developed by the States.

C) translating narrative water quality standards to numeric standards based on federal criteria.

D) allocating loadings and potential load reductions among each perceived source of pollution.

E) expansion of priority waters to include "outstanding national resource waters" and undefined "sensitive aquatic and wildlife habitats" as determined by EPA. These determinations are best made by states.

F) development of targeted watershed areas and watershed plans to protect water quality, which must be approved by EPA.

G) establishing strict allocation regimes for NPS funding at state level.

H) federal approval of site-specific plans.

I) requirements of federal agencies who manage lands to seek EPA approval.

NCA's testimony submitted today will address this legislation in a number of areas, including:

Water Quality Standards/Criteria

Non Point Source Provisions

Timing/Funding

Watershed Planning

Enforcement/State Deference

NCA is also planning to submit written testimony at a later date to this Committee regarding point source issues and wetlands law reform.

WATER QUALITY STANDARDS/CRITERIA

The water quality standards section of current law would be greatly expanded by the inclusion of criteria for sediment quality, numeric concentration limitations for toxic pollutants, and by adding "pathogens or indicators of pathogens (or both), pH, oil and grease". Many of these pollutants are typically naturally occurring. Unfortunately, these natural, historic loadings are not considered. When numeric criteria are established for these pollutants and loadings for a particular water body exceed this criteria, natural loadings may well be the culprit. Without recognition for these historic levels, non point sources of pollution will shoulder the blame and be required to mitigate the pollution problem. For this reason, the establishment of numeric loadings for individual waterbodies, while workable for discernible point

sources, are unreasonable for discrete nonpoint sources. Also, when water quality standards are frequently revised (every three years), they are potentially made more stringent with each revision. NPS will continue to be targeted as the source of these pollutants, further hampering the ability of landowners to make long term management decisions which will protect water quality for the future.

Criteria for "at a minimum, nutrients, suspended solids, and dissolved oxygen" are to be developed within three years. Once again, these are naturally occurring constituents which are only pollutants when agitated by nature or man. Additionally, EPA has plans to develop sediment quality criteria for no fewer than 8 constituents (including PCB's and dioxins). This federal approach for establishing standards and criteria will become the norm, where states, strapped for resources, have no other choice but do adopt stringent federal standards as their own state standard.

States are required to make a number of changes to their water quality standards and designated uses, especially as they pertain to the current triennial reviews. These changes include requirements that states designate uses for all water bodies within their jurisdiction, "as well as numeric water quality standards necessary to support these uses. EPA will provide oversight to these changes, and will designate as "fishable/swimmable" the water bodies in any state which does not establish designated uses. NCA feels that deference should be given to states as they establish uses and the water quality standards necessary to support these state designated uses. The federal role appropriate for this section should include federal support for these efforts, rather than create a program dictated by EPA.

The anti degradation policy included in Title II is problematic, not only because it prevents activities in those waters which exceed established water quality standards, but also because it would go back almost twenty years (November 28, 1975) to establish instream water uses. Once again, the burden of proof for this provision remains with the state, rather than states dictating the standards. Furthermore, the opportunity for relaxation of the anti degradation standards will simply pit point source dischargers against NPS in each watershed. Point sources are allowed to discharge to impaired watersheds, as long as non point sources are subjected to "enforceable best management practices pursuant to Section 319". This provision will create economic and political battles between point sources and non point sources which will not result in water quality improvements.

To prevent this type of infighting, NCA would suggest that states are most appropriate to implement anti degradation programs. These programs should include provisions that recognize that when a discharge is allowed, the state water quality program in place shall assure that point source and non point source programs are available to protect existing state designated uses.

The designation of "Outstanding National Resource Waters" has also been greatly expanded. Not only is the criteria for this designation being expanded, but also the dictates upon states to restrict use of these lands. These lands must also meet the strict anti degradation standards discussed above (zero degradation). This is not based on any failure to attain water quality. Rather than being allowed to identify protections necessary to maintain water quality, States are allowed only to decline an "Outstanding National Resource Water" designation. In the case of federal lands, this must be done with the concurrence of the federal lands manager. States must allow for any citizen to petition for the addition of a water designated as such, but the legislation does not contain a provision for the states to veto this listing. In order to effectively identify and protect those areas needing this designation, the delineation of an area as an "Outstanding National Resource Water" should be left to the states. Designations under this section shall be based on waters with real risks for losing designated uses. Broad categories, such as all waters within national forests, shall not be considered "Outstanding National Resource Waters", unless they have demonstrated an impairment of state designated uses. Any water body designated as an "Outstanding National Resource Water" shall be limited to the boundaries of the designation: upstream and downstream uses shall not be considered.

WATER QUALITY MONITORING

NCA appreciates the recognition this Committee has given to the need for continuous monitoring of water quality for all "waters of the United States". Additionally, the five year monitoring cycle proposed in S. 1114 provides a more realistic time frame under which States can effectively assess the quality of waters within their jurisdiction.

NCA is concerned that, as stated in this legislation, States must assess and quantify the contribution of various sources of pollution as part of their watershed planning process. This requirement will, for the first time, quantify and allocate loadings and mandatory load reductions upon all sources, including NPS. This approach

is unworkable, given the additional burden already placed on states to monitor water quality, identify boundaries of watersheds, and establish water quality standards for each water body. Furthermore, the requirement that allowable discharges for point sources be dependent upon the presence of enforceable NPS provisions will simply pit the economic and political power of point sources against non point sources.

The bill also provides for States to draw water quality data from a number of sources. While other data may currently exist, NCA would question the value of this data if the accuracy and consistency of the data were not compatible with protocols established under state water quality collection regimes.

S. 1114 also provides for the establishment of a Water Quality Monitoring Council directed by the President to provide coordination of Federal and State water quality monitoring programs. NCA would urge this committee to consider that landowners and other water users, who are ultimately responsible for water quality protection, be represented on this Council. NCA also has concerns that this Council may neglect the differences between states as they develop coordinated federal programs and advice for the President.

The premise of comprehensive watershed management is supported by NCA as a means to achieve reasonable water quality standards which protect state designated uses. NCA would caution the Committee regarding the approach taken under these provisions of S. 1114. By including ground water, outstanding national resource waters and sensitive aquatic or wildlife habitat areas (which are undefined), as special categories under these comprehensive plans, the legislation greatly expands the scope of required land management activities. NCA would emphasize to this Committee that these decisions are best made by states. Furthermore, the idea that "any public or nonprofit entity" may be considered as the management entity for watershed management plans, without some level of landowner input, creates a real opportunity for abuse.

The key provisions of the watershed plan also include broad, undefined parameters such as "potential uses" of waterbodies, "living resources" and "sensitive habitats" supported by the waters, perceived "threats" to impairment of water quality, and also an effort to allocate pollutant loadings among sources. As stated earlier, the allocation of load reductions to specific sources is, by the nature of NPS runoff, difficult if not impossible to quantify. It is important to identify sources of pollution, but any means to quantify the contribution of these specific sources will be impossible without comprehensive monitoring at the edge of housing subdivisions and agricultural fields across the country. The quantification and allocation of pollutant loadings, in order to support specific numeric water quality standards, will not be a workable solution for comprehensive watershed management. States should be deferred full authority to identify appropriate site specific plans which protect state designated uses of waters.

The limitations provided for point source dischargers by this section will create conflicts between all perceived sources of pollution in a watershed. S. 1114 provides for permitted discharges into an impaired water body only if the watershed plan includes enforceable requirements under State or local law over the non point sources in the same watershed. The flexibility of land owners to make management decisions to effectively protect water quality is lost by requiring these enforceable measures.

IMPAIRED WATERS IDENTIFICATION

NCA appreciates the efforts of the Committee to target limited resources to those watersheds with known impairments. This philosophy represents a good start by focusing limited resources on areas designated by states to need additional protection, but quickly creates an opportunity where states may lose control over their programs. This can occur in a number of ways, such as the ability of EPA to add to this list waters considered to be threatened with impairments, outstanding national resource waters, and any other water EPA deems necessary for special consideration. The result is a shift in determining the urgency for consideration from a basis of water quality impairments to broad and undefined parameters. Also, citizen petitions should be based on real water quality impairments, and states should have the authority to veto these petitions based on insufficient demonstration of water quality impairments.

Additionally, biological monitoring should not be considered the sole grounds for inclusion on this listing of impaired water bodies. Biological standards should be left to states, in order to determine what standards are appropriate and where these locally derived standards may best be used. Standards for NPS pollutants should be locally based to take into account natural levels of NPS pollutants.

NON POINT SOURCE CONTROLS

NCA appreciates the consideration given landowners by recognizing options for the development of site specific plans, but would caution the Committee to not undermine these efforts by establishing federal guidelines as minimums. The effectiveness of these site specific plans are rooted in their local design, not by virtue of meeting federally established criteria. The time frame outlined in S. 1114 is such that EPA will only reiterate the guidance for the Coastal Zone Act Re authorization Amendments, rather than creating a new, more appropriate document which recognizes differences in climate and topography from state to state. NCA supports deference to states in identifying appropriate NPS management programs as the basis for an effective water quality protection program which is also cost efficient.

Provisions in S. 1114 for those states who choose to not develop watershed management plans adversely impact landowners, not the states. The net result of this proposal would be to require landowners to meet federally established minimum management measures. The only alternative for landowners is to develop site specific plans, which must once again be approved by EPA. Either way, the decision by a state to avoid comprehensive watershed management will adversely affect landowners, rather than states. NCA urges this Committee to refocus it's penalties upon States, not landowners.

S. 1114 currently triggers compliance measures by being located within an "impaired" watershed. Efforts should be made to define impaired areas as those areas which do not currently support existing state designated uses. If a state designated use is not precluded, the water body is not impaired. Broad habitat protection efforts should not be considered.

Congress and EPA should recognize the progress made by States and landowners within states toward water quality protection. Although the current Section 319 program has been historically underfunded and has been given inadequate time to demonstrate its effectiveness, all states currently have in place 319 management plans. Furthermore, the most recent water quality assessment data was collected in 1990 and is inadequate for evaluating the effectiveness of what may have been accomplished to date in terms of gains in water quality. Point sources of pollution have been given twenty years and untold billions of dollars to correct their problems. NPS should be given like consideration.

NCA is currently conducting a research program to assess the accuracy of current state and federal water quality assessments, as well as identifying the level of activities on the part of landowners and state agencies in a number of states. We have attached a brief description of the NCA Water Quality Information Project to this statement. While our findings are not yet complete, we would like to assure you that there are a great number of activities which are ongoing in states across the country. We would be pleased to share a copy of this report upon completion with the Members of this Committee.

TIME FRAME

The time frame for various activities, the success of which depend a great deal upon effective management measures, seem to be short and conflicting. While the three year time frame for implementing management measures and site specific plans may be realistic, the fact is that these plans, required to be approved by the federal agencies, may be slowed by backlogs during the review process. Any delays during this review and approval phase will only shorten the period of time during which approved activities may be implemented.

In addition to backlogs and approval delays, NCA would question the timing of subsequent water quality assessments as site specific plans and management measures are being implemented. For example, if plans are not expeditiously approved, which then delays the implementation phase, well over half of the seven year time period allowed for implementation of these plans will be consumed. If only three or four years remain, after which time the effectiveness of said plans will be evaluated. The likelihood of these activities effectively protecting water quality is greatly diminished. Once again, NCA would urge the Committee to transfer these responsibilities of plan approval to states or local units, such as local conservation districts.

ANIMAL FEEDING OPERATION

NCA would also recommend to this Committee that Animal Feeding Operations which are not subject to point source permits under existing Section 402 not be considered as new sources of NPS pollution, and likewise not regulated under standards different than the balance of agriculture. These smaller facilities many times are, or will be additions to, a diversified agricultural operation. By requiring separate pro-

visions for various components of agricultural operations. Congress will clearly be discouraging diversification of America's farms and ranches.

NATIONAL PROGRAM GUIDANCE

The National Program Guidance is crafted and viewed as mandatory minimums for performance of site specific plans, rather than as a handbook for states to use to develop programs which are specific to their local needs and conditions. To avoid this confusion, it should be clearly stated throughout the guidance and this section of S. 1114 that the provisions contained herein are not viewed as minimums, but rather as recommendations to state agencies who are charged with assisting in the development of site specific plans. NCA also feels that it should be clearly reiterated that states have the authority to develop watershed management plans and management practices that are specific to the local conditions of a given watershed.

FUNDING

NCA appreciates the recognition of additional funding as necessary for the development of successful NPS management programs. EPA would caution the Committee against centralizing the funds in the manner included in S. 1114. For example, for the first two years, EPA has control of half of the funds to be provided to states for NPS management activities. These funds are to be allocated based on a formula which might easily be abused by states who have been starved for NPS dollars for the last five years. NCA would encourage this Committee to develop a provision for direct disbursement of funds to states, where allocations can be made on the basis of local needs.

NCA also would question the funding mechanism to be used beginning with Fiscal Year 1998, where allocations of half of the NPS funds are based on estimated costs of site specific plans. The bill does not indicate who may be responsible for estimating these costs. Landowners who are responsible for developing and implementing site specific plans will have a significant role in estimating the cost of said plans. NCA would question the manner in which this information can be organized by states to effectively compete with other states in securing NPS funds.

Since the 1987 Amendments were passed, funding for state NPS activities has been minimal. Funding for the first three years was zero, followed by funding at half the level authorized the last two years. Nonetheless, many states have developed NPS programs with other, equally limited funds. NCA urges the Committee to take a hard look at funding mechanisms in order to minimize abuses which may quickly hamper efforts to manage NPS runoff, as well as consider realistically the level of funding which may be available in future years. S. 1114 authorizes \$3 billion in NPS funding for Fiscal Years 1994 through 2000, compared to \$500 million for the last five years. It would be unfortunate to see a well crafted CWA re authorization which falls victim to inadequate funding.

The limitations on funds included in S. 1114 appear to be inconsistent with traditional agricultural programs. For example, no other federal funds can be available for a specific grant proposal, yet if funding is made available, the grant can only fund up to half the cost of said project (difference to be made up in nonfederal dollars). Also, this legislation would further limit one of the most effective funding programs by restricting states' grants programs to no more than half of the total funds available. NCA would urge the Committee to divert funding for land acquisition and conservation easements, the latter already provided for under the Food Security Act of 1985, to the grants program. The activity of acquisition, through easement or purchase, should not be granted to EPA, but rather to agencies who are not charged with enforcement of these provisions. At present, the Department of Agriculture can fulfill this role.

SITE SPECIFIC WATER QUALITY PLANS

The site specific plans included in S. 1114 offer opportunities for landowners to be recognized for their unique ability to reduce the threat of NPS runoff. NCA appreciates the Committee's recognition of the role that USDA can play in the development of site specific plans. NCA would encourage the Committee to also recognize local sources of assistance already available to landowners, such as local Soil Conservation Service, Extension Service and Conservation District offices.

S. 1114 recognizes specifically a number of current programs which protect water quality, such as the Conservation Compliance Program and the Conservation Reserve Program. We would hope that other, well developed and effective programs at the state and local level are not forgotten simply because they are omitted from S. 1114. One such program (information attached) has been developed in California by the California Extension Service and SCS with financial assistance from EPA. The

goal of the program entitled the Rangeland Watershed Program, is to develop public understanding of proper rangeland watershed management, to inform land owners and managers about current federal laws affecting private range land management, and implementation of a Rangeland Water Quality Management Plan in California. This plan is an example of states taking the initiative to disseminate information, and subsequently protect water quality.

The requirements for the site specific plans in S. 1114 are troublesome in two areas. First, we question how these plans will be required to demonstrate their ability to reduce water pollution. As we have said before, it is impossible to quantify reductions for NPS dischargers. Rather than quantification of NPS load reductions, effectiveness should be measured by attainment of the state designated use for each particular water body. Secondly, at what level will the determination of adequacy of these plans take place? The legislation would indicate that this task will occur at the federal level, but NCA urges the Committee to place this activity at the most local level possible. This will create less potential for delays and backlogs of a large number of plans at one level, and would also give the site specific plans a truly local orientation in order to help assure their effectiveness.

NCA would also like to discuss the time frame in which these site specific plans will be judged for effectiveness, and subsequently altered if determined to be inadequate. The recently completed Rural Clean Water Program, funded by EPA, provides an explanation of how effective NPS management activities have significant lag times between implementation and demonstrated response in water quality. After completion of the ten year program, some sites were only beginning to show water quality improvements. If the implementation schedule for a site specific plan is closely followed by the five year monitoring cycle, the site specific plan may later be inappropriately judged as ineffective and required to be changed. This sort of coordination of timelines is absolutely necessary for site specific plans to be the effective tool they are designed to be.

The Handbook, as referred to in this section, appears to be a floor by which site level plans are to be evaluated. Although the document is referred to as a "handbook", the expected format of this document (based on the time allowed EPA for publication) is certainly not expected to be user friendly. As long as the CZMA document is simply reiterated as this Handbook, site specific plans will be nothing more federally mandated controls for NPS discharges. Site specific plans must be rooted in local flexibility, and therefore should be developed and assessed by appropriate local agencies, such as SCS or local Conservation Districts.

FEDERAL PROGRAM COORDINATION

NCA questions the intent of the Committee with the approach taken under this section of S. 1114. Other federal agencies, who have clear roles in order to assist in the effectiveness of the CWA, should not be dictated their roles by EPA. For example, the bill states that all watersheds listed under Section 319 by states (with EPA concurrence) are to be considered as "conservation priority areas" by USDA. Additionally, EPA shall dictate to USDA appropriate lands for inclusion in the Conservation Reserve Program (CRP), and assist USDA in prioritizing their expenditures under CRP. Coordination among federal programs is an idea whose time has come; policies which create turf battles between federal agencies will not constructively protect water quality.

FEDERAL LANDS

In order for NPS management activities on federal lands to be an effective component of state watershed management programs, they should rely less on regulations and more on coordination with locally designed site specific plans. Furthermore, states should have a greater role in developing NPS management plans for federal lands, in order to further assure a consistent, coordinated effort between plans on privately owned and federally owned lands which share a common watershed.

ANIMAL WASTE MANAGEMENT FACILITIES

NCA feels that this section of S. 1114 creates an unnecessary new classification of sources separate from other NPS facilities. This section duplicates many provisions for Concentrated Animal Feeding Operations (CAFO's) in current law, as well as the Animal Feeding Operation provision of S. 1114. The provisions of this legislation would require federal guidelines to be developed by EPA. As with other portions of this bill, we would encourage the Committee to reconsider this notion. USDA clearly has, and will continue to, provide technical assistance of this nature to agricultural producers for years. We would also refer the Committee to the Waste Management Field Handbook, recently released by USDA, as an appropriate guide for state

and local decision making with regards to animal feeding operations and associated facilities.

ENFORCEMENT

NCA would question the necessity of such broad enforcement capabilities for citizens, when states must demonstrate adequate enforcement provisions in a state watershed management plan submitted for EPA approval. NCA is also concerned that, as load allocations and reductions for NPS as well as point source dischargers are developed, NPS will be held in violation, sued for unlawful discharge (no discharge permit or exceeding permitted discharge), and fined to the maximum extent possible. This particular section offers a great potential for abuse. If this provision remains intact, discrete NPS activities would be accountable to the same level of permits and fines as discernible point sources.

NCA is also concerned with the provision in S. 1114 where civil penalties are to be used for beneficial "restoration of water quality, wildlife or habitat of the waterbody". This provision will allow special interest groups to sue for wrongful discharge, and then settle the grievance out of court for an amount less than the fine levied on the discharger. Instead, this money should go to the U.S. Treasury or to fund water programs that need funding, rather than as a donation to special interest groups. The significant increase in funding authorized by S. 1114 warrants this change.

STATE DEFERENCE

States have historically been granted deference in a number of substantive areas of the CWA. These areas include the designation of uses of waters within their jurisdiction, water quality standards necessary to support these uses, and land use measures to reduce the threat of NPS runoff. Deference to states should not be hindered by the provisions of CWA re authorization in any manner. An effective NPS management program must be locally based and state managed in order to provide protection for state designated water uses.

Another provision that is an important component of states' rights is what is commonly referred to as the Wallop Amendment. This provision, in a greatly edited form, is included in the Comprehensive Watershed Management section of S. 1114. Many groups, including NCA, have asked that this amendment, found in the current law at Section 101(g), added without changes to the substantive portions of this bill, such as the states' authority section. This is an important provision for land owners and water users in many states of the country.

CONCLUSION

Cattle producers across the country are key components to water quality protection efforts. We have the knowledge and expertise that, combined with local assistance from USDA agencies such as the Soil Conservation Service or Extension Service, will make positive strides toward protecting water quality.

NCA would urge this Committee to maintain a state and local focus throughout efforts to craft a Clean Water Act re authorization measure. Adequate science and funds must be available to accurately identify sources of pollution. Effective and cost efficient responses to water quality problems must be rooted in local programs with solutions tailored to local conditions. Incentives to land owners should be locally based and can include a number of considerations, including technical and financial assistance.

Mandatory federal land use requirements, promulgated at the federal level, will not guarantee significant protection of water quality. They will, however decrease the productive capacity of property, and therefore constitute a takings. The usurpation of private property rights in the form of federally mandated land use control measures, should be avoided during reauthorization of the CWA. A more effective program rooted in local efforts with significant landowner involvement, should be the basis of an effective CWA reauthorization measure.

The NPS provisions of the current law are not broken, but they can be improved upon. The quality of all "waters of the United States" must be assessed on a continuous basis. Limited resources must be targeted to those areas with a demonstrated water quality problem. Land owners, through voluntary programs established at the state and local levels, can be significant components of an effective NPS management program. Federally driven efforts to direct land use will not be adequate to protect water quality. These efforts must be directed by states.

NCA appreciates the opportunity to submit testimony regarding S. 1114, the Water Pollution Prevention and Control Act of 1993. NCA welcomes the opportunity

to work with the Members of this Committee and their staff as CWA re authorization continues. Thank you.

PRINCIPLES STATEMENT OF THE CLEAN WATER ACT WORKING GROUP

AMERICAN FARM BUREAU FEDERATION; AMERICAN FEED INDUSTRY ASSOCIATION; AMERICAN NURSERYMEN; AMERICAN SHEEP INDUSTRY ASSOCIATION; AMERICAN SOY-BEAN ASSOCIATION; THE FERTILIZER INSTITUTE; NATIONAL AGRICULTURAL CHEMICALS ASSOCIATION; NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS; NATIONAL ASSOCIATION OF WHEAT GROWERS; NATIONAL BROILER COUNCIL; NATIONAL CATTLEMEN'S ASSOCIATION; NATIONAL CORN GROWERS ASSOCIATION; NATIONAL COTTON COUNCIL; NATIONAL COUNCIL OF FARMER COOPERATIVES; NATIONAL FOREST PRODUCTS ASSOCIATION; NATIONAL MILK PRODUCERS FEDERATION; NATIONAL PORK PRODUCERS COUNCIL; NATIONAL TURKEY FEDERATION; NATIONAL WATER RESOURCES ASSOCIATION; U.S. RICE PRODUCERS.

CLEAN WATER ACT REAUTHORIZATION: NONPOINT SOURCE PROVISIONS

In the reauthorization of the Clean Water Act. Congress should adhere to the following principles:

1. The Clean Water Act (CWA) does not stand alone in protecting America's waters from nonpoint source (NPS) pollution. Other ongoing programs at the federal, state and local level must be funded fully, coordinated with and not superceded by the CWA. This includes, in particular, the soil conservation and water quality provisions of the 1985 and 1990 farm acts and the state groundwater and surface water protection programs of the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA).
2. Recognizing the 20 year commitment our country has had to eliminating point-source pollution, success in reducing the more complex and diverse NPS pollution will require similar time and resource commitments. However, management of this problem will require a different approach than that of point source pollution elimination because, unlike point source pollution, NPS pollution is primarily a weather-related phenomenon that can be managed, but not feasibly eliminated. NPS pollution is caused by the inadvertent discharge of pollutants from a wide variety of society's most essential activities.
3. The central locus of NPS management solutions should be a reasonable and voluntary approach based on incentives, education and technical assistance as the primary means of managing NPS pollution.
 - NPS pollution management programs should (a) emphasize the protection of water resources and state-designated water uses, including state-designated agricultural uses, and (b) recognize the importance and needs of individual agricultural producers and other landowners affected by the CWA.
 - This approach emphasizes the use of locally designed and applied, economically feasible, site-specific best management practices which do not infringe on private property rights. Implementation of these farm management options over a realistic time frame will further the goal of reaching or maintaining designated uses of water bodies.
 - It is inappropriate to link USDA commodity, conservation or disaster program payments to the success or failure of management programs for NPS pollution authorized under the CWA.
4. Current CWA language contains valuable provisions for NPS management embodied in Section 319. Although this NPS section has been historically underfunded and has been hampered by bureaucratic roadblocks, all states now have approved Section 319 assessments and approved management programs. Within the CWA, it is the preferable vehicle for management of NPS pollution, and changes which occur during CWA reauthorization should reinforce these existing NPS provisions.
 - The proper management of NPS pollution lies in state and local efforts. As such, states should continue to identify and resolve their priority NPS water problems through administration of Section 319 funds. With state oversight and approval, local organizations should continue to carry out these NPS programs. Agencies at the federal and state levels should harmonize objectives and coordinate funding for national and regional NPS management programs.
 - State and local programs should provide for a mix of research, development, education and technical and financial assistance for both planning and implementing actions aimed at achieving state designated uses.

5. Management efforts funded by Section 319 of the CWA should be directed to priority areas based on scientific assessments that identify water bodies with impaired or threatened uses.
 - Priority, as determined by states, should be based on the magnitude of risk to human health, the protection of designated uses, and likelihood of further significant and unreasonable water quality degradation if no action is taken.
 - Strategies should be developed on a hydrologic unit, watershed-wide basis using an approach that includes the consideration of both surface and ground water quality.
 - Programs should focus on cost-effective, site-specific practices for individual operations with flexibility for implementation.
 - In order for Section 319 to work effectively for agriculture, USDA must play a lead role in the delivery of education and technical assistance at the state and local level.
6. An effective and cost-efficient response to water quality problems requires accurate and reliable information on (a) the source, extent, and impact of NPS pollution, as well as (b) the effectiveness, utility and economic feasibility of conservation measures and best management practices.
 - Any Clean Water Act reauthorization should include a strong financial commitment to further research, monitoring and assessment projects.
 - Monitoring should include before and after sampling as well as frequent sampling during storm events and assessment of natural and historic loadings.
 - Scientific research and monitoring projects should follow protocols developed by the U.S. Geological Service and should be conducted on a watershed basis with local and state input.
 - Representative pilot projects aimed at achieving market based incentives on a watershed or regional level should be encouraged.
7. The Clean Water Act Reauthorization should not directly or indirectly create a federal water quality law or program which supercedes, abrogates or impairs state water allocation systems and water rights.
8. Section 319 management programs on federal lands should be developed and implemented by the specific agency statutorily charged with management of the lands in question, rather than by regulatory authorities independent of that agency.
9. It is inappropriate for a reauthorization of the Clean Water Act to provide the authority for citizens suits against individuals participating in NPS management programs.

STATEMENT OF L. SCOTT TUCKER, CHAIRMAN, STORMWATER COMMITTEE, NATIONAL ASSOCIATION OF FLOOD AND STORMWATER MANAGEMENT AGENCIES

Introduction

Mr. Chairman, my name is Scott Tucker, and I am Executive Director of the Urban Drainage and Flood Control District in Denver, Colorado. The District provides both flood control and stormwater management services for the Denver metropolitan area, serving approximately 1,800,000 citizens in 30 municipalities and six counties.

Today I am appearing on behalf of the National Association of Flood and Stormwater Management Agencies (NAFSMA), a national organization representing more than 50 flood control and stormwater agencies serving a total population of more than 50 million citizens. I now serve as Chairman of the organization's Stormwater Committee and as a member of the Board of Directors.

NAFSMA appreciates this opportunity to share our views on The Water Pollution Prevention and Control Act of 1993, specifically its provisions affecting municipal separate stormwater systems. As we move forward together to expand the municipal stormwater program, we need to build a strong intergovernmental partnership. The legislation before us today is clearly moving in that direction. More important, it shows a willingness by this committee to take control of the debate on the future of municipal stormwater quality regulation.

With this legislation, the intent of the 1987 Act is more precisely expressed, underscoring that this is a phased national program of considerable magnitude. It appropriately emphasizes the immediate role that local officials, both elected and technical staff, must play in designing stormwater management programs that will work in their communities and in pursuing measures that respond to identifiable

problems. The legislation also recognizes the limitations of the National Pollutant Discharge Elimination System (NPDES) as a means of controlling urban stormwater runoff in the near term, avoiding "command and control" directives that will not work. In short, the proposal recognizes the limitations of what we now know and sets us on a course to build more knowledge and experience in developing cost-effective responses to municipal separate stormwater system discharges.

Mr. Chairman, as you work to finalize new amendments affecting municipal stormwater systems, please reflect on the recommendations that you will hear today on non-point pollution. Urban runoff quality is a non-point pollution problem. The fact that most communities constructed separate stormwater systems to collect runoff and deliver it as point discharges does not change its character. In virtually every other sector, the same runoff is non-point pollution. Statements before this committee emphasizing the need for flexibility, management approaches, pollution prevention and decentralized decision-making in tackling non-point pollution and urgings that "one size does not fit all" circumstances apply fully to urban runoff as well.

Comments and Recommendations on the Municipal Separate Stormwater Provisions of S. 1114

Mr. Chairman, in reviewing the provisions of S. 1114 within the context of NAFSMA's principles for new legislative amendments, we find that it addresses the major elements of our position statement. A full discussion of NAFSMA's principles is provided later in this statement. The following summarizes the features of S. 1114 affecting municipal stormwater systems, providing suggestions and other comments on areas to strengthen the framework that has been set forth. I have also cited preliminary results from our 1993 survey of the Phase 1 large and medium systems to support our comments on the proposed changes to the municipal stormwater program.

I. Point vs. Non-Point Sources

Short of massive engineering solutions involving costly detention and treatment of municipal stormwater to comparable levels for point sources, the remedies for pollution carried by municipal stormwater systems have to rely on programs for source control, pollution prevention, improved public and private management practices, education and the like. These activities represent the most appropriate and cost-effective methods of addressing municipal stormwater discharges for the foreseeable future.

Local governments have consistently taken the view that while the NPDES permit program was selected as the means to deliver structure and accountability to the national regulatory effort, it is a tool that must be customized to reflect the non-point nature of urban runoff. Many in the local government community believe that it is not possible to adapt the NPDES permit structure to municipal stormwater and have argued that large and medium systems should be taken out of the NPDES permit program entirely.

U.S. EPA in its November 1990 regulations and in other actions on the municipal stormwater program has been struggling with expectations that a NPDES permit somehow guarantees certainty and uniformity in how each community will combat pollution conveyed by their municipal separate stormwater system. The agency has worked to adjust to the limitations of Section 402, establishing a regulatory framework that emphasizes the non-point nature of urban runoff. This approach is fully supported by the legislative history and debate on the 1987 Act amendments and is again confirmed in the proposed amendments before this committee.

The provisions of S. 1114 acknowledge the limitations of the NPDES program, proposing changes that make the permit process more compatible with local control strategies and programs to combat urban runoff. First, the future regulation of most of the nation's smaller communities will be addressed through state non-point program initiatives, not NPDES permits. This is an appropriate course of action and we commend the sponsors for making this change. NAFSMA's members, I should point out, are generally large and medium systems that are now seeking NPDES permits under Phase 1 of the national program. For communities operating under the constraints of the NPDES permit system, the legislation aligns the use of water quality standards in the near term with the realities of local conditions and circumstances in controlling urban runoff. It also provides further direction on the Maximum Extent Practicable (MEP) standard that will guide permit-writers in developing permits based on management practices and other such measures.

II. Water Quality Standards (WQS) & Maximum Extent Practicable (MEP) Standard Water Quality Standards:

The use of water quality standards in municipal stormwater system permits has received considerable attention by all parties involved in municipal stormwater issues. The application of standards and the associated water quality-based limits is the central concern of our members and others that are now developing stormwater management programs under Phase 1 of the program. It also represents the most striking example of how the NPDES permit program, as applied to conventional point sources, fails to respond to the practical and administrative impediments in regulating urban stormwater.

S. 1114 offers a remedy that is not only appropriate, it is essential. We are not in the position to translate existing water quality standards into municipal stormwater system permit limits in a manner that is enforceable or achievable. The provisions of S. 1114 offers a period of time to understand and assess how and if water quality standards can be applied to municipal system permits. I can assure this committee that communities will use this time to implement and demonstrate how management practices and other measures can achieve water quality improvements. It is imperative that the federal government use this time to further refine the science to support the use of standards appropriate for urban stormwater. S. 1114 should include directives that ensure that U.S. EPA undertakes this necessary research and program development.

S. 1114 acknowledges that you can have enforceable permit conditions (i.e. the management practices specified in the permit) without the direct application of water quality standards in the form of numeric effluent limitations. During this interim period, permittees and permit-writers will use water quality standards as the guidepost in developing and assessing the effectiveness of local program efforts. More important, it is has the immediate benefit of allowing communities to get on with the task of developing and implementing stormwater management programs and measures. All of these initial local efforts, its should be noted, are intended to improve water quality, either directly or indirectly.

Mr. Chairman, as we enter the next generation of the Clean Water Act, we must strive to make this program an example of a functioning and healthy partnership, whereby communities work cooperatively with federal policy-makers in taking on the difficult task of controlling pollutants that pass through our municipal systems. This program is not about leveraging permittees with the threat of unreasonable burdens and costs, it is about improving the quality of urban runoff. All parties in this debate know that it is now impossible to subject municipal system discharges to the level of performance of traditional point sources. We commend the authors of S. 1114 for responding to local governments on this issue. It is one aspect of the municipal stormwater program that will be continuously reviewed and evaluated over the next several years.

Maximum Extent Practicable (MEP) Standard:

As you know, U.S. EPA issued its permit application regulations for municipal systemwide permits setting forth a very comprehensive, and in several areas overly-burdensome program framework, to guide permittees and permit-writers in developing municipal stormwater management programs.

During development of first term permits for municipal systems, the permittees will help shape what will be locally- and regionally-specific permit requirements under the Maximum Extent Practicable (MEP) standard. As the committee considers what constitutes an acceptable interpretation of the MEP standards, let me provide some background on how NAFSMA sees the current system and state of knowledge. Preliminary results from NAFSMA's 1993 survey of large and medium systems now seeking permits tells us that most communities do not have enough information to make reasoned judgments about urban runoff and local receiving water quality. These responses are very consistent in noting an inability to demonstrate the effects of management practices on water quality. In the absence of such information, the current program is basically about good community housekeeping. In spite of these limitations, large and medium systems are moving forward with management programs, uncertain about what will work, unsure about how to convince their elected officials and citizens that costs of the program can be justified and not knowing what the benefits will be.

The assumption and the hope is that in the aggregate and over time the applied management practices will improve the quality of urban runoff and, more importantly, the quality of receiving waters.

This view of the system stands in stark contrast to witnesses and others that suggest that there is more certainty in these decisions and urge the adoption of minimum measures to be required in all municipal system permits. This view of the system simply defies overwhelming evidence to the contrary and the experience of practitioners in the field, most of whom are senior engineers in the nation's largest cities and counties. What we consistently hear from our member agencies and others is that the municipal stormwater program at this juncture is a mandatory national demonstration program. Yet these same officials indicate that if there is a problem with urban runoff, they want to find out what it is and what they can do about it.

I noted that NAFSMA is now in the process of assembling information from our 1993 survey of the approximately 200 large and medium systems that are now seeking permits for their stormwater systems under the first phase of the national program. Most of these communities will receive their final permits by the middle of next year. From our survey last year we estimated that the some 200 listed cities and counties have expended nearly \$140 million in preparing permit applications or an average of approximately \$750,000 per community. We estimate based on initial results from our 1993 survey that more than 40 percent of these same jurisdictions anticipate expending at least 10 times the amount of their application costs during the initial five-year term of their permits. In the Denver area, for example, the cities of Denver, Aurora and Lakewood anticipate total expenditures of nearly \$23 million during the first permit term.

The scale of these projected expenditures by large and medium systems over the next five years is a significant effort, given that the problem is ill-defined and the benefits are unknown. This program is obviously much more than "writing your own permits" as some have asserted. It is about communities attempting to identify and correct water quality problems that are real and identifiable. This program will collapse if this committee and others in the Congress give way to the notion that there is a "silver bullet" out there or a "one size fits all" scenario. When you consider this level of investment among the larger systems relative to the level of uncertainty, it does support S. 1114 in terms of how additional communities are phased into the program.

It simply makes sense to allow communities that are brought into the municipal stormwater permit program to secure some of the benefits from the efforts of larger jurisdictions that go before them. The 1987 amendments appropriately set forth such an approach.

This preliminary survey data also underscores the wisdom of proceeding carefully with a statutory definition of MEP. S. 1114 defines MEP as the equivalent of the guidance issued pursuant to the CZMA reauthorization amendments of 1990. Two years after enactment, U.S. EPA is directed to set additional requirements, further defining the MEP standard.

Our survey results further illustrates how difficult it is to design a national program using set assumptions or fixed minimum program elements. For example, the 1987 Act directed that all listed communities remove illicit connections from their stormwater systems. This is good practice and one that makes sense for communities that have a problem. EPA had some evidence to suggest that this was a problem in several communities, providing the basis for the 1987 statutory directive to remove illicit connections. Two-thirds of our 1993 survey respondents have already indicated that illicit connections were not a problem or occurred in low amounts.
